Divine love will not lead us to palliate or to give countenance to wrong things in any, but will constrain us to relinquish our own wrong, and to seek and to desire for others, their illumination by the Holy Spirit, to see their errors, and to be persuaded to forsake them. If Christians expect to be instrumental in spreading the kingdom of Christ on the earth, they must show by their love to Him and to one another, that they are his subjects, and this will be manifested by the fruit of his Spirit dwelling and ruling in them. "By this shall all men know that ye are my disciples," said the Saviour, "if ye have love to one another." All attempts to induce men to become real Christians, would avail little or nothing with them, if it be evident that the advocate of his religion, does not experience its benefits in himself. His preaching would be little better than a lie to them. Worldly mindedness, and the enmity of its professors to one another, are great obstacles to the prevalence of Christiahity. The apostle John testified: "If any man love the world, the love of the Father is not in him. For all that is in the world, the lust of the flesh, the lust of the eye, and the pride of life, is not of the Father, but is of the world." And James says: "Who is a wise man and endued with knowledge among you? let him show out of a good conversation his works with meekness of wisdom. But if ye have bitter envying, and strife in your hearts, glory not; and lie not against the Truth. This wisdom descendeth not from above, but is earthly, sensual, devilish. For where envying and strife is, there is confusion and every evil work. For the wisdom that is from above is first pure, then peaceable, gentle and easy to be entreated, full of mercy and good fruits, without partiality and without hypocrisy. And the fruits of righteousness is sown in peace of them that make peace." These are plain gospel truths, and what is needed among their professors, is to put in practice what they profess; and a wonderful change in the peace and harmony of families, and in the world at large, would soon be effected. Instead of promoting division, they would be concerned to end it. George Fox, who was conspicuous for his gentleness and tenderness, even towards those who had missed their way, and a true lover of peace and harmony, writes to his friends thus. "My dear Friends, live in *peace* and *love* and *patience one with another*, for that doth edify the body; and strife doth not, but doth eat out the good. The body doth edify itself *in love*, in which there is nourishment and virtue, and life from the Head: so in that meet and build up one another. Dear hearts, be faithful, and live in the life, and power and seed of God, and *in love and peace one with another*, and so the God of peace in it preserve you. Peace be among you; *and live in that which keeps peace;* for the peace-makers are blessed. All strive for that which makes for peace; and they *that are lowest*, and so keep, *receive the most* from God."—1669.

A New Species of Coal has lately been taken from a vein opened about twelve miles from Peoria, Illinois, on the line of the Peoria and Oquawka Railroad. It is said to have the appearance of a very fine article of anthracite, though softer; is perfectly clean and free from dust, light and easily broken, has a brilliancy which gives it a transparent appearance, and is apparently free from sulphur. The vein is supposed to cover ninety acres, and as far as investigations have been made, it does not fall short of a thickness of five feet in any place yet opened. This quality of coal is supposed to form but a small portion of the great mass of coal which is imbedded in the bluffs along the Kickapoo Creek.

Selected.

The practice of constantly unbosoming ourselves to men creates religious gossipping, and extinguishes vital piety; and accustoms young converts to consider men more necessary to them than God. Frequently, too, by creating human attachments, it weakens divine love. Our Saviour says 'He is both the Alpha and Omega.' With Him, then, let us begin, as with Him we must end. From first to last all is *of* Him and through Him. He it is that is exalted a Prince and Saviour in Israel, to give repentence as will as the remission of sins. He it is, who is come a great light into the world, that whosoever follows Him should not walk in darkness, but should have the light of life. He is the Lamb that taketh away the sins of the world; He is the good Shepherd that goes before and calls His sheep by name. He is the good Physician, who makes whole, those who touch the hem of his garment; and the residue of the spirit is with Him. Whatever then may be our wants, from first to last we must come to Him.

THE FRIEND.

FIRST MONTH 5, 1856.

Cold weather with snow and sleet have come upon us, and good fires are necessary to ensure comfort in our tight houses. The poor are beginning to feel the pressure of the inclement season, and those who have the means to dispense, may now find out many whose claims on their bounty is undoubted. We hope a liberal disposition will be cultivated.

We are glad to find that the Soup Houses are again opened. The advertisements of two of them will be found in the present number. There is no more efficient or more economical way of dispensing food to the poor, than these establishments afford.

SUMMARY OF EVENTS.

EUROPE.—News from England to the 15th ult.

Intelligence had been received of the capture of Kars by the Russians. It is stated that General Kmety, the

Turkish commander of Kars, had, with another officer, effected his escape through the Russian outposts to Erzeroum, and that thence he transmitted a statement to the effect, that before he left, General Williams had despatched a flag of truce to the Russian commander, offering terms of capitulation. The account, though not very definite, is generally believed to be correct. The garrison had been reduced by famine and disease to about 8000 men. Omar Pacha with his army, was near Kutai which the Russians held in force.

In the Crimea, an attack had been made by the Russians on the extremity of the French lines. The Russians were 3000 strong, and, after an hour's fighting, withdrew. There does not appear to have been much loss on either side. Both armies are reported to be comfortably housed and well provided with provisions and clothing. Since the ground has been covered with snow, vast trains of sleighs have arrived with supplies for the Russian army. They entered the Crimea, by way of Perekop and the spit of Arabat. The weather was cold with much snow. The firing continued between the north and south sides of Sebastopol.

At Berlin, subscriptions have been opened for a new Russian loan of 50,000,000 rubles or £8,000,000 sterling.

The Cracow Czar states positively that it is the intention of the Russian Government to effect the immediate emancipation of the serfs of the whole empire. The Emperor is favourable to the measure, and the land owning aristocracy who have been sounded on the subject, offer no opposition. This statement is, at best, doubtful.

ENGLAND.—The Queen, by order in Council had, authorized the issue of £475,000 in notes of the Bank of England, beyond the amount specified in its charter. The British Cabinet is said to be divided on the question of war or peace. Some of the members are disposed to enter upon negotiations with Russia, but Lords Palmerston and Panmure urge a prosecution of the war. Consols have fallen to 88¼. The liabilities of Edward Oliver, of Liverpool, are stated to be about £1,000,000, and the assets would not realize more than 2*s. 6d.* in the pound. The liabilities of Paul and Strahan's bank are £652,593; estimated assets, £127,670. The Liverpool cotton market was without change. Breadstuffs were rather declining. Western Canal flour was quoted at 41*s.* to 43*s.* Philadelphia and Baltimore, 42*s. 6d.* to 43*s. 6d.*

MEXICO.—The latest news from Mexico state that President Alvarez has resigned, and been succeeded by Comonfort. Alvarez had left the capital for the south. He was compelled to resign in consequence of the opposition of the church party, which still predominates in Mexico. He incurred its displeasure by attempting to make the church subject to the State, by depriving ecclesiastical judges of jurisdiction in civil cases.

UNITED STATES.—*The Value of the Imports*, for the first quarter of the fiscal year ending Ninth mo. 30th, is $72,021,950; of the exports, $60,599,299. Included in the exports is the sum of $13,771,866 in specie.

Congress.—The different factions in the House of Representatives continued, up to the 29th ult., to vote with persevering constancy for their respective candidates. At some of the ballotings, Banks wanted but three votes of the number required to elect him Speaker. The occasional discussions show, that the members generally are so blinded by party zeal as not to discern the palpable folly of the course pursued by them, during four entire weeks of the session. On the 31st ult., immediately after the reading of the Journal, a Message from the President was announced. This occasioned great excitement, amid which a member moved that it should be read. The reading was earnestly opposed on the ground that no business could be done until the House was organized, and that it was an attempted innovation on the practice of the government to send it to Congress in its present condition. It was finally decided by a large majority *not to receive* the Message. The Message was likewise presented to the Senate, and read in that body. The President says that in deference to previous usage, he had waited to be advised of the readiness of the two Houses to receive any public communication he might desire to lay before them, until the first month of the session had elapsed; but that his convictions of duty would not permit him longer to postpone the discharge of the obligation imposed upon him by the Constitution. No synopsis of its contents can be attempted in the limited space allotted to this summary. All the foreign relations of the United States are said to be in a satisfactory state, except those with Great Britain, arising from the attempted enlistments in this country, for the British service, and the conflicting views of the two governments respecting Central American affairs. A large portion of the document consists of a disquisition on the "Constitutional theory of the government."

California.—Two steamers arrived at New York last week, bringing nearly two millions in gold. The dates from San Francisco are to Twelfth mo. 5th. The markets for most kinds of merchandise were dull, and prices declining. Crime in various parts of the State abounded, and the resort to Lynch law was frequent. Two men arrested in Alameda county, on a charge of stealing cattle, were taken from the custody of the sheriff, and hung by "the people." The Indian war in Oregon and Washington Territories, continued with much loss and suffering on both sides. The Indians at Puget's Sound had joined the alliance against the whites, and have killed many of the settlers. Several engagements had occurred between the volunteers and Indians in which the latter were worsted. The Indians had destroyed between twenty and thirty families, near Rogue river.

Philadelphia.—Mortality last week, 170; of scarlet fever, 11; small-pox, 16. Of the coal shipped during the year, from the terminus of the Reading Railroad, 770,066 tons were for Massachusetts, Rhode Island, Connecticut, Maine, and New Hampshire; 523,312 for New York; 52,860 for New Jersey; and 212,918 tons for southern ports.

New York.—Mortality last week, 331. The specie shipments of the week amount to $364,798, making a total for the year of $27,530,141. Much excitement was caused by the detention of the steamer Northern Light, which it was believed was about taking out reinforcements for the Walker government in Nicaragua. After about two hundred suspected individuals had been put ashore, and security given in the sum of $100,000, the steamer was allowed to depart. Two U. S. officials went out in the steamer, whose duty it was to prevent any munitions of war from being landed at Nicaragua, if such were concealed in the vessel.

Kansas.—Disturbances continue in this territory. On the 15th, the citizens voted on the adoption of the Constitution framed by the Free State Convention. The Missourians again interfered at various points; a large mob destroyed the ballot boxes at Leavenworth, and at other places they would not allow the polls to be opened.

Miscellaneous.—Cattle are still driven to California overland in large numbers, notwithstanding the heavy losses suffered by the way, and the increase of the stock in California. A Placerville paper notices the arrival there of three hundred head of cattle belonging to one firm, four hundred and forty-five to another, and five hundred and fifty to another, all driven from the States across the plains.

Change of Name.—Queen Victoria, in accordance with the wishes of the colonists, has changed the name of Van Dieman's land to "Tasmania."

Manufacture of Railroad Iron.—The Danville (Pa.) Intelligencer says, "The quantity of rails made by the Rough and Ready Iron Works, at Danville, average 100 tons per week, and the Montour Works, having about four times the capacity of the Rough and Ready, must average at least 300 tons per week, making an average of 400 tons per week at the two establishments.

Georgia.—The population of Georgia, by a census just taken, compares with that given in the census of 1850 as follows:

	1850.	1855.	Inc.
Whites and free coloured	524,503	542,567	18,064
Slaves	381,682	389,237	7,555
Total,	906,185	931,804	25,619

Railroads and Steamboats.—The number of railroad accidents in the United States, in the year 1855, is stated to be 142, by which 116 persons were killed, and 539 wounded. The steamboat accidents numbered 27, by which 176 persons were killed, and 107 were wounded. There have been fewer disasters the last year than in the previous one. In 1854, 773 persons were killed, and 814 wounded by accidents attending these two modes of travelling.

Prohibition.—The Maine Law enacted in the province of New Brunswick, has been approved by the Queen of England.

Guano.—The Peruvian government has decreed that the guano on the Chincha Islands shall be sold at public auction for nine months, at a price not less than $30 per ton. At this price the estimated quantity on the Islands would produce $350,000,000.

Fire Arms for England.—Twenty-five thousand rifles for the British government are now being manufactured at Windsor, Vt., and Hartford, Conn. The American mode of making small fire arms has been adopted in England, from plans obtained here by British officers. The machinery, such as is used at Harper's Ferry, has been built there, and persons from this country have been employed to superintend it.

RECEIPTS.

Received from Abm. Cowgill, Io., $2, vol. 29
A. Garretson, agt., O., for Wm. C. Williams, $4
28 and 29; from S. C., for John Birdsall, C. W., 17, vol. 30.

SOUP HOUSE.

The Society for supplying the poor of the city with soup, have opened their house, No. 16 Green's court, and are daily delivering soup, (First-days excepted) between the hours of 11 and 1 o'clock, to such needy and worthy poor as produce a recommendation from a respectable person.

As the Society is dependent for means to support this useful charity, on the annual donations of the benevolent, they respectfully solicit aid from such as may be disposed to contribute. Donations in money may be sent to the Treasurer, Jeremiah Hacker, No. 144 North Fourth street, or to Thomas Evans, No. 180 Arch street.

Beef, flour, beans, rice or other vegetables will be gratefully received at the soup house.

WESTERN SOUP HOUSE.

The above was opened on the 3d instant, and the managers will be grateful for contributions in aid of their funds, which may be sent to

WILLIAM BIDDLE, cor. Arch and Eleventh streets
SAMUEL L. BAILY, No. 252 Chestnut st.

A stated meeting of the Philadelphia Association of Friends for the Instruction of Poor Children, will be held on Second-day evening, 7th inst., at half past 7 o'clock.

Philad., First mo. 3, 1856. EDWARD RITCHIE, Cl

WANTED.

A Friend in the wholesale dry-goods business, has want of a youth, 16 to 18 years of age, who writes good hand, is quick and accurate at figures, and who to make himself generally useful. Apply at Friends' Bookstore, No. 84 Arch street.

Friends' Boarding-School for Indian Children, at Tunessassah.

Two women Friends are wanted at this Institution to assist in the family.

Also, a man Friend to aid in carrying out the concern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTON, 377 S. Second st.
THOMAS EVANS,
Philad., Eleventh mo. 1st, 1855. 180 Arch st.

WEST-TOWN BOARDING SCHOOL.

Wanted, a Teacher of the Classical Department in this Institution.

Application may be made to either of the undersigned members of the Committee.

SAMUEL HILLES, Wilmington, Del.
THOMAS EVANS, SAMUEL BETTLE, Jr. } Philada.

DIED, on the 23d of Third month, 1855, at his residence, Chesterfield, Morgan county, Ohio, ISAAC HALL, a member of Chesterfield Particular and Monthly Meeting, in the Seventy-sixth year of his age.

——, on the 28th of Tenth month, in West Whiteland, Chester county, Pa., JOHN TRIMBLE, in the 68th year of his age. He was a member and overseer of Uwchlan Monthly Meeting, and was concerned for the support of the ancient doctrines of our religious Society.

——, on the 23d of Twelfth mo., 1855, in the 81st year of her age, SARAH WEBSTER, widow of Isaac Webster, a member of Haddonfield Particular and Monthly Meeting, New Jersey.

——, in the 65th year of his age, after a brief illness, STEPHEN M. STAPLER; a valuable member of Wilmington Monthly Meeting. He was endeared to a beloved family by the affectionate interest he took in promoting their comfort and welfare in every respect. He possessed a sound and discriminating mind, and was esteemed by his friends for his unassuming piety, and attachment to the cause of our holy Redeemer, exhibiting in his life the practical effects of a firm belief in the doctrines and precepts of the gospel. He was ever ready to alleviate the sufferings of the poor and the friendless, to whom he was a liberal benefactor. In the removal of this dear Friend, his family and friends feel they sustain a heavy loss, but are comforted in the hope that their loss is his eternal gain.

THE FRIEND.

A RELIGIOUS AND LITERARY JOURNAL.

VOL. XXIX. SEVENTH-DAY, FIRST MONTH 12, 1856. NO. 18.

PUBLISHED WEEKLY.

ce Two Dollars per annum, payable in advance.

Subscriptions and Payments received by

JOHN RICHARDSON,

PHILADELPHIA.

tage to any part of Pennsylvania, for three months, id in advance, three and a quarter cents; to any of the United States, for three months, if paid in nce, six and a-half cents.

Appeal for the Ancient Doctrines of the Religious Society of Friends.

(Continued from page 130.)

especting the Gospel, and that salvation which ers, the following opinions are expressed:—

f this general description of the Gospel of Christ correct (and it will I believe be found to be that ich is presented to us in Scripture) the way of deerance which it proposes, must necessarily have ject to those who hear it: and these we know form y a part of mankind." Page 45.

gain:—

'urther, if we examine the volume of Scripture, we ll, I think, see reason to conclude, that as a geneprinciple, the discovery which it makes of the die counsels in relation to the eternal interests of n, has reference to those to whom its contents are le known, and not to the human family at large. r can we be surprised at this. The truths which l has revealed to man through the Scriptures, are not igned to gratify his curiosity, but to effect importpractical results. Hence as these truths are in the ure of things addressed to those who read or hear m, so do they especially relate to the spiritual conon and prospects of such; not referring to those he rest of mankind any further than is necessary the accomplishment of the Divine will, that those o have the knowledge of God's revealed truth uld communicate it to their less privileged fellow .

Thus while the Scriptures of the new Testament dere, that all men have sinned, and are thereby chiln of wrath, that the gospel of Christ is a way of ration applicable to the condition and wants of all, t it is the will of the most High that it should be blished to all, and that deliverance from the wrath come, is contingent on its being believed and obeyed those who hear it; they do not profess to unfold final destiny of those to whom it is not made own.

In stating this as a general truth, I am, however, y far from meaning to imply that the Scriptures ord no data whatever for arriving at a conclusion regard to the question now before us. It appears me, that so far as relates to their testimony, the ject is left in such a position as to admit of our ely taking either of two courses in regard to it. the one hand, they who judge it to be wisest or est to leave all consideration of it, as a matter not ressly revealed by God, confiding in his perfect dom and goodness, are doubtless fully justified in doing. On the other, they who think themselves led upon to entertain it, for the purpose of vindiing the Divine goodness in opposition to the fearassumption that all who are ignorant of the gos- of Christ, are thereby necessarily excluded from benefit of his salvation, will not only find in Scripe ample means for that purpose, but also sufficient ound for giving a general affirmative answer to the estion above proposed." Page 59.

fter stating these opinions, the reasons are n upon which, the author says, he conceives are justified in concluding that *a way* of salvation is open to all mankind; but that the evidence upon which this conclusion rests, is such, as should lead us to hold it modestly, and cheerfully indulge those who may think it safer, in the absence of any express revelation, to leave the matter, as one respecting which they are neither required nor qualified to form a decided judgment, the matter being one which after all cannot perhaps be regarded as of absolute certainty. Such views as are here expressed cast a doubt in relation to the possibility of the salvation of those who have not the knowledge of the Scriptures; nor are they consonant with the doctrine held by our Society, as set forth in the following passage from Robert Barclay's Apology. "Therefore Christ hath tasted death for every man; not only for all kinds of men, as some vainly talk, but for every man of all kinds; the benefit of whose offering is not only extended to such who have the distinct outward knowledge of his death and sufferings, as the same is declared in the Scriptures, but even unto those who are necessarily excluded from the benefit of this knowledge by some inevitable accident; which knowledge we willingly confess to be very profitable and comfortable, but not absolutely needful unto such from whom God himself hath withheld it; yet they may be made partakers of the mystery of his death (though ignorant of the history) if they suffer his seed and light (enlightening their hearts) to take place (in which light communion with the Father and the Son is enjoyed) so as of wicked men to become holy, and lovers of that power by whose inward and secret touches they feel themselves turned from the evil to the good, and learn to do to others as they would be done by; in which Christ himself affirms all to be included. As they have then falsely and erroneously taught, who have denied Christ to have died for all men; so neither have they sufficiently taught the truth, who affirming him to have died for all, have added the absolute necessity of the outward knowledge thereof, in order to obtain its saving effect." Prop. vi.

In treating upon the doctrine of freedom from sin, the following language is used:—

"These expressions [freedom from sin, and the service of God and of righteousness] cannot mean in "their general application, a state of things in which "men are wholly delivered from the power of sin, and "found habitually rendering a perfect obedience to the "law of God. We know certainly that this was not "the case with at least the greater part of those whom "the apostle addressed as being made free from sin; "any more than it is now the case with those whom on "scriptural grounds, we justly recognize as servants of "God." Page 84.

From this exposition it would follow, that scripturally speaking, a man may be a servant of Satan, while on scripture grounds he is justly recognized as a servant of God.

Again, in controverting the position laid down in Barclay's proposition concerning Perfection, that persons may be free from actual sinning and transgressing the law of God, and in that respect perfect, it is said:—

"If, instead of looking at the subject as a question of "possibility, we regard it in a practical point of view, "and with relation to actual experience, I believe we "shall hardly be prepared to admit what is stated in "the proposition." Page 348.

Again:—

"But can we venture to say, that there is, or indeed "ever has been, a class of persons thus living free from "actual sinning? I do not think either that experience "and observation warrant our going so far, or that we "have any sufficient authority for it in Scripture." Page 348.

If the positions taken in the extracts given, were true, it must follow, either that men never are wholly delivered from the power of sin in this world, or that freedom from sin is compatible with the occasional commission of sin, which is a contradiction in terms. It is the pure in heart only who shall see God. The heart must therefore, at some time, be made completely clean, in those who are prepared to enter his presence; and the same power which cleanses and makes pure, is able to keep the temple where he dwells, free from spot or blemish.

Speaking of the baptism *with water* practised in the primitive church, it is said, in p. 117—

"The baptism which was thus practised in the apos- "tolic age of the church, has been generally, and *I be- "lieve justly*, regarded as that of which our blessed Lord "spake in his parting commission to the eleven apos- "tles"—

—when he directed them to baptize in the name of the Father, and of the Son, and of the Holy Ghost. It is, however, admitted by this author, that water baptism was not thus instituted as an ordinance to be *perpetually* and universally observed among Christians. But the arguments adduced are altogether insufficient to prove that the baptism then commanded by our Saviour, was not to be perpetually and universally requisite for all his true disciples. Water is neither mentioned nor implied in the injunction, nor is there any limit to the baptism commanded.

After speaking of the belief of Friends that the gift of prophecy, or that of speaking unto men to edification, under the immediate influence of the Holy Spirit, is still continued, and expressing his unity with it, as a part of their testimony to the spiritual character of the Gospel dispensation; it is added, page 380—

"At the same time I must express my belief that from "its [the Society of Friends] rise, there has existed "among its members more or less of a defective appre- "hension of the circumstances under which spiritual "gifts are *now* exercised in the church; by reason of "which, the appointed connexion between the exercise "of ministry and the use of the Holy Scriptures, as *the "means provided for instructing the Church* in divine "truth, has not been in the general fully appreciated."

Again, the writer, after alluding to what he believes to be a mistaken estimate both of the place assigned to direct revelation in the present economy of the Church, and also of that allotted to the Holy Scriptures, says—

"It is manifest that in whatever degree such a defec- "tive view of the subject prevailed, it could not fail to "have a hurtful influence on the character of the minis- "try. By preventing the Scriptures from being dis- "tinctly regarded as *the appointed source* from which "ministers are to derive their knowledge of the truths "which they declare, it would almost necessarily inter- "fere in some degree or other, with such an use of "them as this appointment demands." Page 380.

Again, in page 383—

"Were the important principle more distinctly recog-

"nized, that the Holy Scriptures are *the appointed means* "for conveying to the Church the knowledge of divine "truth, it would naturally lead to a more careful ex- "amination of their contents, and an increased disposi- "tion to make use of such helps, for ascertaining their "true meaning, as are placed within our reach. In this "way a more correct apprehension of some matters of "doctrine, and of the meaning of many parts of Scrip- "ture, would gradually pervade the body at large; and "would extend to individuals whose circumstances or "habits of mind necessarily disqualify them for much "personal application to the study of the sacred volume. "I must, however, be permitted to express my convic- "tion, that the benefit to be expected from such a course "cannot be fully obtained, without a greater of freedom "from *undue deference* to the views and modes of expres- "sion adopted by *our early Friends*, than has hitherto "been common amongst us."

Although it has always been the religious concern of our Society, to recommend to ministers and others the diligent and frequent perusal of the Holy Scriptures, yet to set persons occupying the station of ministers to work studying the Bible, in order to learn those truths which they are to communicate to their hearers, and to urge them, for the purpose of ascertaining the true meaning of the Scriptures, to examine and compare the various commentaries and criticisms upon them, put forth by learned men; while the idea is held up that the exercise of spiritual gifts is not the same now, as formerly, and that there is, in the Society, a mistaken estimate of the place assigned to direct revelation; is calculated, if acted upon, to degrade the character of the office, and to produce a wordy, lifeless ministry in the Society. The gift, and the qualification to exercise it, must be derived immediately from Christ, the Head of the Church; and every truly anointed minister of the Gospel, exercises his gift, "not in the words which man's wisdom teacheth, but which the Holy Ghost teacheth." His speech and his preaching are not with enticing words of man's wisdom, but in demonstration of the Spirit and of power; that the faith of the hearers may not stand in the wisdom of men, but in the power of God.

When remarking upon the duty of private prayer and the true warrant for it, that words are not essential to it, and that men may be much under the influence of the spirit of prayer, when language is not uttered; he says:—

"I must, however, believe, that such utterance, ac- "companied by a suitable posture of the body, is the "natural and appropriate expression of the feelings of "the heart, and that it is ordinarily implied when pray- "er is spoken of in Scripture. Indeed, so intimately "are the spiritual and corporeal parts of our constitu- "tion united, that while the emotions of the soul prompt "to the utterance of the lips, the latter is often found, "in its turn, *to be a means of increasing the fervour and "strength* of the former." Page 378.

On this principle, the passions might be wrought up to a high pitch, and those who are readily warmed by a fire of their own kindling, might imagine their performances to be the effectual fervent prayer that availeth much, but, after their creaturely efforts, lie down in sorrow.

The following are given "as some of the evil consequences," which the author believes to have resulted from what he styles "the defective and incorrect views," promulgated by our early Friends, and retained by the Society, viz.—

"The Holy Scriptures have not in the general been "sufficiently regarded and used among us as the appoint- "ed record of Divine truth, and *the source* from which the "knowledge of it, is to be derived by the Church"— "the introduction among us of imperfect, not to say er- "roneous views in regard to some important parts of "Divine truth,"—"an undue estimate of the place as- "signed to immediate revelation in the economy of the "Church, with an inadequate one of that which be- "longs to the volume of inspiration,"—"a disposition "in those who held them, to form too high an estimate "of the spiritual authority under which they spoke, "wrote and acted,"—and lastly, the influence which "extreme views respecting immediate revelation have "had upon the ministry among us, and the erroneous "estimate of its character and authority, to which they "have sometimes led." Page 253, 4, 6.

As a general charge against the Society, it is said:—

"Looking at the past history of our Society, it can- "not, I think, be said, that the Lord Jesus Christ, in "his various characters and offices, has always had "that place in our general views of doctrinal truth, our "ministry and writings, which he has in the sacred "volume, and which seems inseparable from the method "appointed by divine wisdom for carrying on the Lord's "work in the earth, namely, the preaching of salvation "through faith in his name." Page 312.

Besides the attack upon Barclay's Apology, of which the author states "he has made most use," because, among other reasons, "it is altogether the work which has had in past times, and which yet continues to have, the greatest amount of influence, either direct or indirect, upon our doctrinal views and modes of expression;" there are attempts made to controvert doctrinal statements of George Fox, William Penn, Thomas Story, John Richardson, and Richard Claridge.

The quotations given will exhibit some of the writer's views on Christian doctrine and practice; and although there are in the work, acknowledgments of the immediate influence of the Holy Spirit, and of the necessity therefor, yet the sentiments contained in the passages quoted above, and others advocated throughout the work, are repugnant to the doctrines of the Gospel, as held by our religious Society. The appendix abounds with charges against the writings of our early Friends, and with cavils at the interpretations of Scripture passages given by them, and always received by the Society. We feel ourselves bound to bear a decided testimony against the tenor of the whole work; to declare our unshaken belief in the doctrines of the Gospel as promulgated by our early Friends, and to deny the charges preferred against the founders of our religious Society, and the excellent works which they have left behind them. Were the Society to conform to the unscriptural opinions advocated in the work under notice, it would be carried back to the beggarly elements, to the institution of a ministry dependant upon human talents and learning, influenced by the various jarring commentaries upon the Holy Scriptures now existing in Christendom; and that most precious freedom from reliance upon outward means, would be lost, in which we are enabled to sit down together in solemn silence, and worship the Father in spirit and in truth, without the intervention of words. Thus the very existence of the Society would be destroyed.

(To be concluded.)

For "The Friend."

The Fate of Sir John Franklin.

If the report of Dr. Rae left any doubt as to the melancholy end of Franklin and his adventurous party, it has been dispelled by the return to Canada of two traders of the Hudson's Bay Company, named Stewart and Anderson, who were sent overland to the Arctic Ocean, to ascertain what they could in regard to the matter. Some account of the expedition is contained in the St. Paul's, (Minnesota,) Pioneer of a late date; that paper says,—"Stewart, with a party of fourteen men, started from his post, the Carlton House, in 54° North latitude, on the 7th day of February, 1855, and proceeded to Fort Chipewyan, at the head of Lake Athabasca, in latitude 58° North, at which point they arrived on the 5th of March. It had been determined to make the trip to the Arctic Sea by water, so far as was practicable, and the party, therefore, remained at this post until 26th May, busily engaged in constructing bo and making other preparations for their dr journey. At that date the party left Fort pewyan, and journeyed by canoe on the Peace ri which connects Lake Athabasca with Slave L some three hundred and fifty miles in a north terly direction, till, on the 30th May, they arr at Fort Resolution, which is situated on an isl in Slave Lake, about latitude 61° North.

"At Fort Resolution the party was joined Anderson, who, with Stewart, had been appoi to the command of the expedition. Here ano delay was made, for the purpose of reorganizat and making the last preparations, before atten ing to penetrate the interminable frozen No These arrangements completed, the party sta on the 22d day of June, for the head of G Fish river, or as it is known on the map, B river, in latitude 64° North. Thence they lowed the course of the stream to the Arctic oce Stewart represents the navigation of this rive exceedingly dangerous—being obstructed by one hundred difficult rapids. Over all th however, with nothing more substantial than bi bark canoes, they passed in safety, and arrive its mouth on the 30th of July.

"Here they met with Esquimaux, who co borated the reports of Dr. Rae, and directed th to Montreal Island, a short distance from mouth of Back river, as the spot where, accord to their instructions, they were to commence nute exploration. From this time until the of August, the party were industriously engag in searches on the Island, and on the main la between 67° and 69° North latitude. We can recapitulate the perils escaped, and privations dured, by the brave band while seeking to t traces of their countrymen who had perished these desolate shores. Three times they pr dentally escaped being crushed between mov mountains of ice. At last on Montreal Isla where their explorations commenced, they fou snow-shoes, known to be of English make, w the name of Dr. Stanley, who was surgeon of John Franklin's ship, the Erebus, cut in them a knife. Afterwards they found on the same land a boat belonging to the Franklin expediti with the name 'Terror' still distinctly visible. piece of this boat containing this name was brou along with him by Stewart. Among the Esq maux were found iron kettles corresponding shape and size with those furnished the Frank expedition, and bearing the mark of the Brit government. Other articles known to have longed to the expedition, were obtained from Esquimaux, and brought by the party for depo with the British government. No bodies, h ever, were found, or traces of any. The report the Esquimaux was, that one man died on M treal Island, and that the balance of the pa wandered on the beach of the main land opposi until, worn out by fatigue and starvation, th one by one, laid themselves down and died too.

"The Esquimaux reported further that India far to the North of them who had seen the sh of Franklin's party, and visited them, stated th they had both been crushed between the iceber Stewart took especial pains to ascertain whet the party had come to their death by fair mea or foul. But to every inquiry, the Esquima protested that they had died of starvation. thering together the relics found, the party set o on their return on the 9th day of August la The return route did not vary very materia from that taken on their way north. Stewart h occupied the whole time since in reaching c city—having come by the way of the Red riv

ntry, and having been absent in all about ten
ths. Stewart left St. Paul recently *en route*
he Hudson's Bay head-quarters, at Lachine,
ada, to submit an account of his adventures."
Montreal paper gives some additional items
terest respecting the expedition. "No papers
ooks, and no human remains, were found; nor
it likely, as four years had elapsed since this
edy was enacted upon a low sandy beach, ex-
ed to the storms of four Arctic winters; and
e is little doubt that either the sea has washed
or the sand has buried deep, the unfortunates
perished on this spot. The Esquimaux were
friendly, and freely displayed all their trea-
es obtained from the boat, or found near it,
these consisted principally of the oars, used by
m as tent-poles, the boat kettles, the empty
served meat cases, &c., &c., but no papers, and
natives stated, with every evidence of sincerity,
none had ever been seen nor found.

Few further details of the last moments of
lost party have been collected; we may men-
one mournful incident reported by an Esqui-
x woman, who saw the last man die; he was
e and strong, she said, and sat on the sandy
h, his head resting on his hands, and thus the
survivor of Franklin's Expedition yielded up
spirit. Anderson and Stewart retraced their
s to Great Slave Lake, from whence the latter
inued his journey onwards to Red River set-
ment, and thence via the Minnesota Territory,
Montreal, where he arrived recently, direct
n the Arctic Sea, after upwards of five thou-
l miles travel in open craft, and through un-
abited regions, without a halt.

For sixty days and nights the party saw no
there being no timber on the Great Fish Ri-
or Arctic coast; and during those sixty days
travelled incessantly in open craft in a wretch-
climate, never had dry clothes or slept on dry
kets, and never ate cooked victuals except on
occasions, when they made a little tea by
ns of a lamp. This party of sixteen in all travel-
in bark canoes down one of the most turbu-
rivers known, even to North-west voyagers;
tured among the ice on the Arctic sea, and re-
ied to their starting point without meeting
a single accident to person or property—and,
ual, performed all that was required of them;
had they gone out four or five years earlier,
ld, no doubt, have been instrumental in saving
lives of a portion of Franklin's party.

One word in conclusion as to the Franklin
edition. The two vessels Erebus and Terror
England in 1843—were last heard of in 1845.
y probably tried several passages, but were
led by the ice; and finally, in 1848, were
shed, probably in Victoria Straits. Many of
crews perished, but one or more boats got off
h the survivors, who took all the stores they
ld collect, and travelled southwards towards the
tic coast, in the hope of reaching some of the
dson Bay Company's ports. The season of
9 was probably spent on this dreary journey,
renewed in 1850, where they reached the
st at the mouth of Fish river, but in so exhaust-
a state that they could merely run their boat
the beach, and crawl ashore to die. This seems
that is certain, and all that we can ever know,
he fate of the Franklin expedition."

"It is not wealth that can supply our real
nts, but Providence; and if we do not submit
desires to Him, we may in the midst of wealth,
only suffer from real wants, but be tormented by
itious ones. Death will come, and when it does
e the conscience would be more tormented by
erfluity than the body by want."

For "The Friend."

Self-Examination.

Daily self examination is essential to the christian's stability and growth. In his business he has need to recur to his treatment of those who have dealt with him, to see whether a strict regard was paid to their just due, and that he gave way to no temptation to circumvent them in the quality, or by withholding full measure and weight in quantity, of the articles obtained from him. A clear conscience in relation to his dealings is indispensible to peace and the divine blessing, and to an upright standing among men. To do justly is the first point laid down in the divine law.

After mingling with his friends in a social way, and participating in conversation he should review the part he has acted, to see whether any sentiment that would not bear the test of truth or propriety—whether any expression derogatory to the character of another, had escaped his lips—whether while he maintained a christian cheerfulness, he had refrained from levity, and every remark calculated to excite it, or an unchaste thought, and had maintained the dignity of a watchful christian.

On being engaged with his fellow members in deliberating on matters of a civil or religious nature, he should examine whether he gave way to a loquacious habit, that interfered with the time and the rights of his companions to deliver their opinions—whether his manner conveyed evidence of control over himself, and of submission to the judgment and sentiments of others, particularly when they were more correct than his own, and whether his general demeanour showed the gravity becoming his profession.

In meetings for discipline he should inquire, whether he was divested of all wish to carry any point in support of his own views, especially when differing from the sentiments of judicious friends—whether his sole object was to act in accordance with the divine will, and whether he had treated his brethren and sisters, as having the same right to act under the same authority, and had respected their judgment and their feelings, as he would wish to be treated by them—and proved that he would prefer suffering, than to give way to a spirit of contention that would break the unity of the meeting, desiring that Christ should rule over all things.

In relation to the public worship of God he should solemnly review his conduct, and the state of his mind, whether he had diligently attended when in his power, all the meetings to which he belonged; and when there, whether he had sought for strength to abstract his mind from the world, and shut out, as they presented, all cogitations on his business and passing events, and every thing that deters from the performance of acceptable worship; and humbly waiting on God, had experienced the Lord to come into his heart, quicken him by his spirit, and raise prayer, praise and thanksgiving to his Father in heaven.

This every day examination, will give the following of Christ, an opportunity to detect his own imperfections, to see whether he has failed to maintain the watch, and the warfare against his soul's enemy, and when he is made sensible of any mis-step, to humble himself before the Lord, seek forgiveness and renewed strength to resist the future assaults, of his cruel foe. It will also furnish the opportunity to feel for an offending brother, and to be clothed with charity towards all men, desiring they may be restored when they fall into error. If in this retrospection, there is no sense of condemnation, the peace of God that passeth understanding will be his reward, and at seasons warm and expand his heart, with humble gratitude and love to his almighty preserver, and with love to the human family, especially to the household of faith. As the christian cultivates this daily inspection into his condition, he will become established in it as a fixed habit and duty, and therein experience preservation. The natural or old man with his fallen propensities and deeds, will be put off; temptation, through divine help, and watchfulness unto prayer, will more and more lose its power over him—he will be increasingly prepared by living faith and the sanctification of the Holy Spirit, to hold communion with the Father and with his son Jesus Christ, and to witness his sins to be forgiven and washed away by his precious blood.

For "The Friend."

The Philadelphia Cattle Market.

According to a table published in the Ledger the sales at our cattle markets for the last thirteen years have been as follows

	Beeves.	Cows.	Swine.	Sheep.	Total.
1843,	37,420	15,121	22,490	91,480	166,511
1844,	45,732	18,519	25,420	51,056	143,727
1845,	51,298	18,805	26,455	56,948	153,506
1846,	47,500	14,480	18,670	55,810	136,460
1847,	50,270	16,700	22,450	57,800	147,220
1848,	67,211	14,108	46,690	78,820	205,829
1849,	68,120	14,320	46,700	77,110	206,250
1850,	68,750	15,120	49,900	82,500	213,270
1851,	99,100	15,400	46,700	83,000	214,200
1852,	71,200	14,420	49,200	81,200	216,620
1853,	71,900	15,100	53,300	72,300	212,600
1854,	76,300	16,175	72,150	61,000	226,475
1855,	53,150	9,420	66,800	171,151	300,521

In the last year there has been a great falling off in the supply of beeves, and a large increase in the number of sheep sent to market. There is reason to apprehend that the consumption of beef in the United States for some years past has been too large for the supply, and that the stock of cattle in the country has in consequence been materially diminished. As population increases there will be a diminution in the number of domestic animals, unless some means are taken to counteract the natural tendency to that result. In the state of New York between 1845 and 1850, there was an increase of nearly half a million inhabitants; and more than that number of acres were added to those previously improved; yet during those five years, the number of horses, cattle, sheep and swine was reduced about *three millions eight hundred thousand*. It is said that the same law of diminution is observable in the richer regions of the South and West.

A Trout in a Well.—F. Hoyt, a correspondent of the Country Gentleman, writing from South East N. Y. Eleventh-mo., 19. says:—"Can any one tell how long a trout fish will live? Twenty five years the past summer I came on the farm where I now am. Almost the first work that I did after getting in my spring crops was to drain a bog swamp, the outlet of which leads into the Croton river. I had an old Scotchman to do the ditching. One day he brought up a trout about the size of a man's little finger, in his whiskey jug—by the by, we used a little on the farm then, and not since then. I put it in the well near the house, and it is there now grown to a goodly size—say about a foot long and large in proportion. It has been fed but very little, once in a while some one throws in a grasshopper or cricket, to see him catch it. The well is thirty feet deep, and water hard, and settles down nearly to the bottom, and then again rises to near the top. He has been taken out a few times to clean the well, but not for the last five years.

"Friday last I got a grasshopper—the last one I expect to see this fall—and gave it to him. The water is now twenty-five feet deep, but it

hardily touched the surface before he had it. If any one has a fish older than mine I would like to know it."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 132.)

ELIZABETH WEBB.

On returning home from New England, towards the close of the year 1724, Elizabeth Webb brought back as usual certificates of the unity of Friends, where she had laboured in the gospel of Christ.

It was perhaps about this time she wrote "An inward breathing of a soul to Almighty God, set down in the spring and opening of Divine love, and in humility."

"Oh! Lord, how manifold are thy mercies! I cannot recount them up in order to thee. Thou hast brought my soul through many fiery trials, hast delivered it out of many distresses, and from many snares which the subtle enemy hath brought it into. Thy word has been quick and powerful, sharper than any two edged sword against the man of sin, the transgressing nature. For this in humility I bless and praise thy holy name, O Lord! My soul doth love thy judgments, and can say to thy praise they are just and righteousness altogether; by them is thy servants warned, and in keeping of them there is great reward. Let thy judgment be the line, and righteousness the plumb line that all my thoughts, words, and deeds may be squared and measured by. Thou knowest, O my sweet Lord, that my soul loveth to wait for thee, in the ways of thy judgments, that everything may be done away that is displeasing to thee. Thy love and the light of thy countenance are the sole comfort of my soul. By these thou art daily sweetening my passage through this vale of tears. Thou supportest my soul by that faith which thou hast given, which worketh in and by thy matchless love, which is indeed inexpressible. Let me commune with thee reverently of thy mercies and judgments. Thou knowest my soul loveth to draw near to thee, and to bow in reverence at thy feet, even as Mary did outwardly. Thy presence is near, can my soul say, Thou, who art possessor of heaven and earth. When I look into this world with that inward eye which thou hast opened, I see thy Providence in thy Universal Spirit, which upholds, feeds and nourisheth thy whole creation, and when I retire inward, I find thee, O my beloved! sitting in the centre of my mind, giving forth thy royal law, and when it is obeyed, causing thy glorious light to shine to my great joy and inward comfort. Oh! I have too much gone out from thee and left thee, my Lord and Saviour, to sit alone, knocking and calling inwardly to my soul, to return in and dwell with thee. The enticing vanities of this world, the subtilty of thy enemy, and my soul's enemy, have kept thee too long out of the throne, O Lord, my Saviour! I am grieved that I ever grieved thee, and promise, by thy assistance, to give up my heart, will, and affections wholly to thee, that so thou may take to thyself thy great power and rule, and reign in my bosom, that my poor simple soul may be thy loyal subject, and that thy kingdom may come to me indeed, and thy holy will may be done in and by me here on earth, as it is done in heaven. That, while I have a being here, my soul may be made fit to stand on the sea of glass mingled with fire, with the numberless number of the redeemed.

"Oh! my God, my breathing is unto thee that thou would be pleased to incline the hearts of my children and fellow mortals, to love thy glorious light, that all thereby may see themselves to be, what indeed they are, and that they may see this world to be, whilst it is governed by the prince of the power of the air, even a kingdom of vanity. Oh! that all may consider and remember that thou hast said, 'Behold, I come as a thief. Blessed is he that watcheth and keepeth his garments.' Oh! that we may all watch and pray, to the end of our days here, that so we and our children may be so purified by the operation of thy grace in our hearts, whilst following the Lamb through many tribulations, that we may get perfect victory over the beast, and over his image and over the number of his name. Thus being made fit to stand before thy throne, we may be enabled to sing the new song, even the song of Moses, and the song of the Lamb, saying with all those who have gotten the victory, 'Great and marvellous are thy works, Lord, God Almighty,—just and true are all thy ways, thou King of Saints, who shall not fear thee.'"

After this, Elizabeth Webb took no long journey. Her trials through life had been many, and yet we find evidence that sweetness of spirit and resignation of mind to the Divine will marked her declining days. On the 6th of the Ninth month, 1726, she closed a life of useful labour in the church militant, and we have no cause to doubt, but that it was her glorious privilege to join the church triumphant, with which, even in her darkest earthly afflictions, she had at seasons been permitted to have blessed fellowship. Her age was 63 years.

JAMES DANIEL.

James Daniel was born in Ireland, in the year 1674 or 1675. In the year 1680, his father, Neal Daniel, removed with his family to America, and settled in Alloway's Creek township, Salem county, West Jersey. The Indians at that time were numerous, near their settlement, and the young lad James, as he grew older, mingling with them, soon learned their language perfectly. He retained through life a warm feeling of attachment towards them, and often in riper years, testified that the natives of West Jersey, at the time he first knew them, were grave and temperate, and used no manner of oath in their speech. About the year 1690, Neal Daniel died, leaving his son under care of Friends, that he might be educated in the way of Truth.

The visitations of the Holy Spirit to his soul, being submitted to, James soon embraced the Truth "in the love of it," and grew in grace as he grew in years. The Divine favour was evidently with him, and as his experience was enlarged, through the dispensations allotted him, he was made a useful member of the church militant. He married early in life, and ruled his house well, having his children in subjection, and through the faithful labour bestowed, and the blessing of the Lord therein, they grew up useful in the church, and in the world. Of some of them we shall have occasion hereafter to speak, showing how the seed of the righteous are often eminently favoured even from generation to generation.

He was appointed an elder, and being placed as an overseer of the flock, he performed his religious duty therein in the spirit of love, and of meekness, whereby his friends say, "His service" was rendered "acceptable," and he obtained a "good report." He was diligent in the attendance of meetings for worship and discipline, although for many years it was through many difficulties, few roads being opened in the neighbourhood. With much labour, and at a very considerable expense, he succeeded in obtaining a public road near his house, and in having bridges erected over streams. This rendered it easy to attend meetings, and opened a way to his dwelling for travelling Friends, to entertain whom his house and heart were open. He "was zealously concerned for the honour of God, and promotion of Truth." He lamented that as the country grew older, people grew worse, and that they had corrupted the natives in their morals, teaching them by words, and the excessive use of strong drink. During the latter part of his life, he, for example sake, partook of no spirituous liquors, and frequently admonished such as were in the habit of using it, "to observe great temperance."

A few years before his death, his eldest son having nearly or quite arrived at manhood, he entrusted the care of his business to them. He then quite in middle age, but his mind seems divested of earthly cares and concerns, as much as though he possessed nothing. His time, talents, his substance, were devoted to the service of Truth, and he often accompanied Friends in their religious engagements, to his great satisfaction."

"When his departure drew near, the Lord gave him a sense thereof by a vision in the night season," as he mentioned to his family, whilst in health. On one occasion "at meal time as setting a while in silence as his manner was, said to his wife and children, 'Now I am near to leave all, or to be called to some very great work. I believe my departure is near. I have often told you my time here was short. I believe I must alter my will."

He attended to this intimation, and settled his concerns whilst yet in health. Soon after this was accomplished, he was taken ill with a pleurisy. In the eight days during which this painful disorder was wasting his bodily strength, he was enabled to give much good advice to his family, friends and the neighbours, who came to see him, giving abundant evidence of the happy condition of his mind. The day before his close, many Friends and neighbours being present, a religious meeting was held in his chamber, during the holding of which he was composed, and after it was over expressed his great satisfaction. One of the neighbours on taking leave, said, "Farewell, James the Lord be with you." To this he replied, "I not doubt it, Thomas; I do not doubt it." So of his Friends taking a solemn farewell, he said, am glad of this visit, and of the meeting. I have great concern on my mind for this generation." mentioned many evils which appeared to prevail, and added, "Many of the elders are called away, and more must soon [go], and if some of you young men, do not lay your shoulders to the Lord's work, Truth must even fall in the streets. But I hope the Lord will raise up some that shall be faithful and zealous.

That night apprehending his departure near, took a last farewell of all present, beginning with his wife and then his children in order, giving every one something in charge. To one he said, "Thou dost not know what service the Lord has for thee to do in thy generation." Soon after this he grew drowsy, and about 10 o'clock departed like one falling into a sweet sleep. His death took place on the 26th of the Tenth month, 1726, being in the 52d year of his age.

(To be continued.)

But it well deserves our notice, that while each denomination claims a preference for its own peculiarities, God has given his blessing to those wherever their aim has been holy, their efforts earnest, and the essential truths of Christian faith have not been violated. Where, then, God will

not His *blessing*, man must not withhold his
y.—*L. Richmond.*

TO THE AFFLICTED.

ot, I am with thee; Oh! be not dismayed,
am thy God, and will still give thee aid;
strengthen thee, help thee, and cause thee to stand,
d by my righteous Omnipotent hand.

thro' the deep waters I call thee to go,
vers of grief shall not over thee flow,
will be with thee, thy troubles to bless,
anctify to thee thy deepest distress.

through fiery trials thy pathway shall lie,
ace all sufficient, shall be thy supply;
ames shall not hurt thee—I only design
ross to consume, and thy gold to refine.

Selected.

Let Cæsar's dues be ever paid
To Cæsar and his throne,
But *consciences* and *souls* were made
To be the Lord's alone.

For "The Friend."

Reason and Revelation.

may truly be said, that "reason is a noble
y." Yet, when any attempt to judge of the
s of God merely by their own carnal reason,
will be very likely to be led astray, and come
wrong judgment; for all our reasoning pow-
n be appropriated by the natural man, and
he natural man cannot comprehend the things
od. The experience of every truly spiritual-
ed man or woman will bear testimony to the
of this, and will accord with the testimony
e eminent apostle Paul, who, in his first epis-
o the Corinthians, chap. ii., ver. 14, says,
t the natural man receiveth not the things of
Spirit of God; for they are foolishness unto
neither can he know them, because they are
ually discerned."

e Society of Friends from its rise have professed
a spiritually minded people; they have always
forth the doctrine of the necessity of depend-
upon the unerring Spirit of our blessed and
Redeemer for right direction, not only in our
idual walk through life, but in the government
e affairs of the church. We profess to believe,
we have unshaken ground for our belief,) that
gh the adorable mercy of our heavenly Fa-
a measure of his Spirit is given to every son
daughter that is born into the world, to profit
al. Sorrowful indeed will become our condi-
if through an unwillingness to go deep
gh to know the mind and will of the Great
l of the Church, by the inshining of his Di-
light upon our understandings, we should
nd upon our own judgment, or reason, in
ing of those things which none can rightly
r until they are stript of every feeling of self-
eousness, which of a truth is as filthy as rags,
brought to the place of true-waiting in the
ce of all flesh; for it is, when we are in this
ition that the Lord condescends to give us
g knowledge. If the enemy of all good—who
h about like a roaring lion seeking whom he
devour—can draw us away from an entire
ndence upon the light of Christ, and get us
a disposition to judge all things by the light
ason only, he may carry us on little by little,
l we are willing to conclude that the Divine
t of Christ ought to be considered as a secon-
r rule of faith. Oh! that all those who have
a drawn, perhaps almost imperceptibly to them-
es, into too much dependence upon their own
on, and carnal judgment, could be persuaded
onsider their nothingness, and look again unto
n whom they have pierced, be willing to bow low before him, and ask of him to show them, who they are that he owns, that so we may be brought into his fold with them, and He may own us also, according to our allegiance unto him. "Is Christ divided?" May it not be said of us, as the apostle said of the Corinthians, "Ye are yet carnal, for whereas there is among you envying, and strife, and divisions, are ye not carnal, and walk as men?" And again he says, "For other foundation can no man lay than that is laid, which is Jesus Christ." O that we may all endeavour to get deep enough to come at this foundation, and build upon it; for this is the Rock upon which every wise builder builds, and no storms can shake those who are thus built up and grounded upon Christ the Rock of ages. "The foundation of God standeth sure, having this seal, the Lord knoweth them that are his." The Lord knoweth them that are his the world over, and as they keep low and humble before him, he will strengthen them from season to season, and own them by his life-giving presence, which is more to be desired than all things else. O, for more individual faithfulness amongst us, more coming up in the line of individual duty, more coming out of, and forsaking the ways, manners, and maxims of the world. Was it not said, that Israel should dwell alone, that they should not mix themselves with the nations? and was it not complained of Ephraim, that he had mixed himself with the people, and that strangers had devoured his strength, and he knew it not? and if we go out into the ways of the world, and become as it were mixed with the people, will we not be shorn of strength, though the enemy may persuade some to believe that we are not conforming to the world, but that the world is becoming more conformed to us; that it is not required of us to be so plain and simple-minded as our forefathers were: but he is a liar. The Spirit by which our forefathers in the Truth were led, if given up to, will lead or keep Friends of the present day out of the very same that they were led out of, and into the very same that they were led into; but if we give ourselves up to reason on these matters, we will be as likely to go astray in them as in anything else. Let us not be ashamed of those precious testimonies for which our early Friends so deeply suffered. Let us not be ashamed of the cross of Christ, lest he should be ashamed of us. Let us be willing to manifest to the world on whose side we are, bearing testimony by our life and conversation that we are desirous of being redeemed from the world its ways, its manners, and its lying vanities, that we may become the children of God, and joint heirs with Christ.

Chester County, Twelfth mo., 1855.

For "The Friend."

On Shooting Stars and Meteorites.

(Continued from page 135.)

In the year 1581, between the hours of one and two o'clock in the afternoon in Thuringia, Germany, a stone weighing 39 pounds of a blue and brownish colour, fell from the heavens with a loud explosion which shook the earth, and was accompanied by a slight light. It sunk four feet into the ground, and tossed up the soil to the height of ten or twelve feet, being so hot when first discovered that no one could touch it.

Francis Conli, a learned and highly respectable gentleman of Verona, reports the fall of a large stone 6th Month, 21st, 1635, about 5 o'clock in the afternoon. It was preceded by a great mass of flame, which moved with such velocity that the eye followed it with difficulty. This flame illuminated the whole country around, and was succeeded by a great explosion, while at the same instant the meteorite descended to the earth, upon the grounds of the Benedictine Monks at the town of Vago, about six miles from Verona; when on the following morning a stone was discovered which had penetrated about a yard into the ground.—It was invested with a black crust, having minute particles of iron disseminated thoughout its substance, and emitted a sulphurous smell. This stone was broken into several pieces, the largest of which was about 4 feet square and of a cubical form.

In the year 1706, a stone weighing 72 pounds fell in Macedonia. It was preceded by a small cloud which passed through the sky from north to south with a loud hissing sound; then suddenly exploding with a violent noise discharged the aerolite to the earth.

Near the town of Luce, in Germany, in 1768, at half past 3 o'clock in the afternoon there appeared a stormy cloud, from which a peal as of thunder or the discharge of cannon was heard. Some reapers upon looking up saw an opaque body descend from it, and fall in the high road near them upon some soft turf. They immediately ran up to it and found it to be a stony mass, one half of which was buried in the ground and so hot as to be unfit to touch. This meteorite was presented to the Academy of Sciences of Paris, who appointed Lavoisier, Fougeroux, and Cadet a committee to analyse it. The result gave Silica 55.5, Iron 36, Sulphur 8 parts in 100 as its composition.

In the year 1790, Seventh mo. 24th, an extraordinary shower of stones fell near Bordeaux, in France. M. Baudin states that as he and M. Canis were walking out about half past 9 in the evening, the sky being cloudless and the moon shining brightly, they found themselves suddenly surrounded by a pale clear light which eclipsed that of the moon.

On looking up, they observed near the zenith a fire ball of a diameter greater than the moon, drawing after it at rain five or six times longer than its body, and which gradually tapered to a blood red point, while the rest of the meteorite was of a pale white. It proceeded with a rapid motion from north to south, and presently split into portions of considerable size, which fell in all directions like the fragments of a bomb shell bursting in the air. Most of these fragments became extinguished before they reached the earth, while some assumed a blood red colour. In two or three minutes a tremendous explosion was heard, which resembled the simultaneous firing of several pieces of heavy ordnance. The concussion of the atmosphere caused by this explosion, produced effects similar to those of an earthquake; shaking windows in their casements, and throwing kitchen utensils from their shelves. It afterwards appeared from the concurrent testimony of numerous persons, that at the time of this explosion there fell at Juillac, about eight miles distant from the above place numerous stones, over a space near two miles in diameter. One of these stones weighed 25 pounds, and their force was so great in some instances as to break branches from trees.

1791. In Tuscany, at 7 in the evening an extraordinary cloud was observed to emit sparks and smoke like a furnace, attended by sounds resembling the firing of muskets, at the same time casting ignited solid masses of stone down to the earth. Signor Montauk could discern in its central portions, "as it were the basin of a fiery furnace having a a rotary motion." He saw a stone drop from it at a farmers feet, and upon digging it out of the ground found it to measure five inches long by four wide being of a black hue, with iron particles visible through its structure. Some females at

Ozone 20 miles from Siena, saw a number of these stones fall in a meadow near them, which were so hot as to burn the hand of one of them, upon her attempting to pick one up.

1795. In Scotland, a meteorite fell so near to a labourer as to dash up the dirt on him, penetrating the ground to the depth of 19 inches. This stone was dug up and found to weigh 50 pounds.

1798. At Villefranche, in France, at 6 in the evening, a globular body diffusing a vivid light passed rapidly across the heavens, with a hissing noise, leaving a long train of light and emitting bright crackling flames, when it exploded with a loud report; and immediately three labourers saw it fall at the distance of only fifty paces off, making an aperture in the ground 18 inches deep. This stone was afterwards exhumed and found to weigh 20 pounds.

1798. At Benares, India, a luminous meteorite was seen to pass through the air, and subsequently exploding, discharged numerous stones upon the earth; one of which penetrated through the roof of a peasants house, burying itself several inches deep in the earthen floor. A gentleman in the vicinity collected eight of these stones.

1803. At the town of L'Aigle, at 1 P. M. a fiery globe was observed traversing the heavens, when suddenly it exploded violently with a report which was heard over a space of 30 leagues. Numerous stones fell from it, one weighing 17½ pounds. These stones were at first of a firable nature but gradually acquired hardness by exposure. The distinguished French Savant, M. Biot, was deputed by the government to investigate the circumstances of this occurrence; a service which he performed with much care and research, examining many eye-witnesses to it in all parts of the country where it was visible. One person who was working in the open air informed him of a stone which fell at his feet, grazing his arm in its descent. On attempting to take it up, its intense heat forced him to drop it instantly. Nearly all the inhabitants of twenty villages were witnesses to this fall of stones, including persons of every description of character and temperament, many of whom testified to having seen portions of the aerolites roll down from the roofs of houses where they had alighted. Others to seeing them break branches of trees, and some of them rebounding from the pavement.

1807. At Weston, in Connecticut, at 6½ A. M. a fire ball was observed to issue from a dark cloud, being in size about half the diameter of the moon. Its appearance was vivid and sparkling like incandescent iron, and its path in the heavens was marked by a pale waving luminous train, which remained visible about half a minute. Thirty or forty seconds afterwards three very loud reports were heard, and stones were discharged to the earth, of which six different ones were found and examined. One was dashed in pieces against a rock, and the fragments when collected weighed two hundred pounds.

1828, Sixth mo. 4th. In Virginia about seven miles south west of Richmond, an overseer and several negroes who were at work in a field heard an explosion in the air, succeeded by a noise like that of a cart drawn over a stony road, which appeared to approach and pass overhead and beyond them, ending in a dull sound or concussion like that of a heavy body falling to the earth. Upon proceeding to the spot from whence this sound emanated, they found a hole in the ground a foot in depth, from which they disinterred a stone weighing four pounds of undoubted meteoric origin.

1827, Fifth mo. 9th. In Tennessee near 4 P. M. as a planter with his son and servants was engaged in planting corn in the field, they were startled by hearing a report or rather a series of reports in the atmosphere, like the successive discharge of platoons of musketry. Presently after some small clouds of singular appearance, followed by trains of black smoke were observed to discharge a number of stones to the earth with a whizzing noise. One of the stones fell about fifty yards from the son, and in its descent struck a papaw tree, tearing it to pieces as though it were by a stroke of lightning. On going to the spot, the stone was found 8 or 10 inches beneath the surface of the ground.

1829. In Georgia between 3 and 4 P. M. a small black cloud appeared from which two explosions were heard, followed by a tremendous whizzing noise in the air, when two gentlemen saw a large stone descending which penetrated the earth to the depth of three and a half feet, and weighed thirty-six pounds. Upon examination this stone exhibited the usual characteristics of meteorites.

1823, Eleventh mo. 7. An aerolite fell at Nobleboro, in Maine, of which the following account is taken from Silliman's Journal "M. Denismores attention was attracted by hearing a noise, which at first resembled the discharges of platoons of soldiers, but soon became more rapid in succession. After the explosion a little white cloud appeared to be in rapid motion downwards as if about to fall on him, and causing a noise like that of a whirlwind among leaves. At this moment a stone fell among some sheep which were much frightened by it and ran off. Going to the spot he found a stone about forty paces in front of his position, which had penetrated the earth near six inches where it struck another stone, and was broken to pieces by the collision.

A similar occurrence is narrated as having taken place at Nanjemoy, Maryland, Second mo. 10th, 1825, in which instance the explosion was heard over a space of country 25 miles in extent.

(To be continued.)

For "The Friend."

The following is from the life of Thomas Wilson who with James Dickinson, travelled in America (from England) in the love of the gospel, at the time of the separation, occasioned by the apostacy of George Keith. After arriving at New York, he says: "Then the word of the Lord was in me, thus: Hasten, hasten to visit my great people in Philadelphia; so we went forward, having some good meetings on our way thither. When we came to Philadelphia, there was a great division raised amongst Friends by George Keith. We preached the Lord Jesus powerfully amongst them, and had some labour tending to peace. My companion had it often upon him to warn them all to keep more inward to the Lord, we staid some time there and visited Friends in that province, having had many precious meetings amongst them, some of which were kept out of doors, for want of room, and great flocking to hear the truth declared, although it was winter time." After visiting other parts of the province he thus proceeds: "From thence we went to Philadelphia, where we found the difference between G. Keith and Friends broken out to an open separation, he having gathered a company to himself, and *set up a separate meeting*, which was cause of great exercise to faithful Friends, and he seeing we did not go to his separate meeting, sent us a challenge to dispute, which we readily complied with, and had a meeting with him and his party, a great many faithful Friends accompanying us. We sat awhile in silence to hear his charges against Friends, viz., that some of them were not sound in faith, doctrine, and principle; but did not prove it suffer Friends to answer him, but went on rat we said nothing, which raised a great desi him and his abettors, to have another me with me and my companions which we re agreed to, providing some faithful Friends along with us, to bear witness, for I knew the *like seperate spirit*, which had appeare England, *was a lying spirit*. Some time having divers Friends along with us, we again with the said George Keith and the of his abettors; and being quietly set to what he had to say he advanced his former ch against Friends, as being unsound in faith, trine and principle; unto which I answerec error in faith, doctrine, or principle of partic men or persons, was a sufficient reason for hi set up a separate meeting." "He opposed then I asked liberty to be heard, and told hi this effect, if he and his company were soun faith and doctrine and men of God, they sho have kept up their testimony for the Lord in meeting, and if there must have been a separa such unsound men or persons would have g away from Friends, as those did formerly, of wi John said, "They went out from us, because t were not of us, for if they had been of us, t would no doubt have continued with us; but t went out that they might be made manifest t they were not all of us." 1 John 2, 19. I asked them wherever they knew faithful Frie in England leave their meeting and set up a se rate meeting? thus we left the dispute at that t and went to visit Friends "elsewhere," and t returned again to Philadelphia, and had a th meeting (very large) with Kieth and his party told them they were gone from the Lord in airy flourish, and the wit of man, and set u separate meeting; but in a little time the sun righteousness would shine amongst them, and dr away the misty doctrines of sin, and they (me ing the separates) should dwindle and die aw and come to nothing, except such as were m honest towards God, who should return to truth e Friends, which in a little time was fulfilled both respects."

In this instance there was no casting out disowning but by the separatists; and Willi Penn narrates an instance wherein it was sa the desire was not that such that had er should be cut off, but rather that by being bou to a living body some life and warmth might vive the weakly and dwindling members, Oh! compassion of Jesus even for his murdere "Father forgive them for they know not wh they do," how can such who are so anxious to off those who stand for the truth as it was in the ginning, think that they profess the spirit of Jes

Canada-West, 12 mo., 1855.

For "The Friend.

Rewards of Mechanical Genius.

It is the common opinion that inventors rarely remunerated adequately, and often die p and neglected. In most instances, where su is the case the invention itself has probably be wanting in something requisite to give it imme ate practical value. The really useful mecha ical inventions would appear to be liberally p for. The Scientific American enumerates a f instances in point.—"The right to a portion Ward's patent shingle machine was recently s in Albany for $35,000. A portion of Robertso sewing machine has also been sold for $30,0 This is an invention which can be carried in t pocket, and will enable a seamstress to do in day the ordinary labour of a week. Machines this kind are about to be constructed in N

n, Conn., at $10 apiece; the manufacturers w constructing the machinery, and expect l orders in First month. Howe's patent g machine yields, it is said, $50,000 for li- s to use it, and Singer's machine puts $75,- nto the pockets of the owners. Rights to se of a corn planter have been sold to the nt of $30,000. Clark's patent pump sold for 00. A portion of the right to an apple g machine, $2000. Creamer's patent car , $200,000. Such rewards as these are cer- stimulating to mechanical genius."

For "The Friend."

House-Keeping.

st people are familiar with the old adage, 'Cleanliness is next akin to Godliness," some have also heard that "we may be more nice wise:" there is not so much danger in the nt day, of not duly respecting the former, literally verifying the latter proverb; if we judge from the exquisite nicety, and scru- s precision of arrangement of some of our r houses, where cleanliness seems to run fastidiousness; and neatness into primness. not now speak of such as serve to illustrate e showiness, and the splendour and costliness furniture, that wide departure from primi- implicity, that pride and worldly mindedness, ich to be deplored in these degenerate times, f that excessive refinement of good house- ng which betokens the ruling passion of the ess, in equally strong characters. We have times been almost ready to put off our shoes our feet, lest they should profane the delicate ts, and if a straggling ray of the excluded ght will permit us to find a seat, the touch- ot aspect of the sofas and chairs, seems to the inclination to rest our weary weight upon , however comfortable they might prove. y, we have thought, a household idol must rshipped here, and however free from super- s ornament, or chaste in subdued colours, these urs, all redolent of the incense of new paint, be its temple. So unsullied in its vestal tness, so new and untarnished by time and s every thing, that it would seem that those noisy vandals the children, and even the ed sunshine itself were never permitted to in- its sanctity. I suppose sunshine if they can , and the children must be kept in some little room where all the family gather; but it d not offend me to see even in the show rooms, evidence of domestic love, of innocent family yment of warmth and life, of the presence of osy romping little urchins of the household, oy or torn picture book on the floor, a small or two, or perhaps even the marks of their chubby mischievous fingers some where dis- d; though I say this at the risk of being d a slattern. And where are the aged mem- of the family? I have a pleasant memory of ceiled parlours, with tiled chimney pieces, a ancient clock in the corner, a comfortable ng chintz-covered sofa, the air fragrant with iums and lemon trees, and almost hallowed he presence of a silver-haired grandparent, d in an easy arm chair, by the fire side; an ment to the room, and a reverend picture of eful resignation, waiting the summons of the renly Master to one of the mansions prepared hose who have long followed him in the path elf-denial: but we rarely see the aged now; too I suppose are secluded away in the back lings, not by compulsion perhaps, but because prefer a little cosy fire side nook, in a sun- y room to the uncongeniality of the great ny prim parlours.

There seems to be prevalent a perfect abhorrence of any thing time-worn; even the very bricks in the front wall must be painted or replaced by new ones, and in many instances the wood work painting is renewed almost annually, indeed all things about the premises are modernized; and yet though a true respect for antiquity seems almost obsolete, there has been of latter time a sort of feverish revival of the taste for antique style, among a certain class, and old garret lumber has been rummaged up, patched and dressed anew; and where no old furniture could be obtained, immitations have been made to order; but this is only one of the many phases of affectation, similar to that by which we have the quaint homely names of Abigail, Deborah, Sarah, &c., made ridiculous by being converted into Abbie, Debbie, Sallie, and the noble ones of Margaret and Elizabeth, degraded to Maggie and Lizze, &c. Such folly is but of the fashions of this world which soon pass away. Much more consistent with good taste, good feeling and respectability would it be, to let the old well-kept furniture,—almost consecrated to us by association with dear ones departed, who long ago handled and used it,—stand in its accustomed place,so long as it served its wonted purpose, silent mementos that we too shall soon pass from our earthly places, to be brought thus to remembrance by those who succeed us, when out mortal part is sleeping in the narrow house appointed for all living.

We cannot too often be reminded that we should let our moderation appear in all things, and although the most rigid preachers of self-denial of the present times, would hardly recommend a retrograde in social customs to the uncouth semi-barbarism of our remote ancestors, yet it is wholesome sometimes to revert to by-gone periods, when such things as we call necessities were regarded as luxurious superfluities, even among persons of rank and wealth. It might serve as a check to those who appear to allow no limit to their indulgence in refinements and delicacies; as may be seen in the equipment and provision of the table, and even in some instances a really ludicrous affectation of foreign habits, in the almost princely luxuriousness of accommodation in the sleeping apartments, &c. &c. All that wealth can command, such think they may indulge themselves in, if they do not look too showy and high-coloured, and still be plain consistent Friends—and those who have not the means too often toil after it in the same spirit of ambition, weary and discontented that they cannot compete with their associates. In the picture above drawn, no individual example has been in view. I do not wish to prescribe rules, being aware that difference of circumstances must have its weight. My object is simply to drop a few hints, with the hope of awakening a little self-questioning in each of our minds, as to how far we may be carrying a lawful thing to an unlawful extreme? and that more of us may be willing to raise high the standard of sobriety and temperance, in a day which calls for upright examples more than high profession; a day in which pride and high living, under a peculiarly deceptive guise seems ready to overwhelm the very life of religion.

May the female heads of families who have precious daughters to train to be wives, mothers, and useful members of society, while they are instructing them, in the art and mystery of housewifery, truly excellent in itself and worthy of its due share of regard, may they not pursue it, as some appear to, as the chiefest good and highest object of female ambition. It is better to let their education in this particular be habitually derived from the good example always held up in a well ordered family, where "the mother looketh well to her household," and "the children rise up and call her blessed." The domestic economy under a good regular system, will generally go on almost mechanically requiring little pains taking, and leaving the thoughts and affections free for more worthy objects.

A sensible woman, who has a perception of the excellency of the Truth, and seeks to have her mind regulated by its restraining power, will not allow the minor virtues to usurp an undue prominence, so as to become exaggerated into faults, and to occupy that time which should be devoted to more elevating pursuits. She will not in regard to dress, furniture, or living, become "more nice than wise," and yet she will more likely be an example that thorough cleaniness is perfectly consistent with religion, and that there can be no true refinement without it.

Commercial Value of Insects.—The cochaniel insect, from which a beautiful scarlet dye is obtained, is imported to the extent of 1000 tons annually, the value of which is estimated at $745, 000. From the silk worm we obtain no less than 2716 tons of silk, 2206 tons of which are in the raw state, and are manufactured in this country; the remaining 510 tons are already fabricated. When we consider that this quantity is the consumption of one country only, all being the produce of small insects, it appears surprising how the industry of man could collect so much, and elaborate it into rich and gorgeous attire. One thousand tons of pearl shells are imported, the whole of which is manufactured into buttons and studs. "For better or for worse," we import no less than 8,000,000 leeches.—*English Paper.*

A false friend is like a shadow on a sun-dial, which appears in fine weather, but vanishes at the approach of a cloud.

THE FRIEND.

FIRST MONTH 12, 1856.

The extension of railroads into all parts of the country, has wonderfully changed the habit and modes of travelling. People who in former days, when stages or private carriages were altogether depended on for transportation, from one part of the country to another, would probably not have ventured on a journey of fifty miles from home a dozen times in the whole course of their lives, now think nothing of starting every little while to travel perhaps hundreds of miles by railroad; expecting to sit quietly in comfortable cars and be hurried to their place of destination, at the rate of twenty-five or thirty miles an hour. The rapid and constant intercourse by railroad between the city and the country and small towns immediately surrounding it, has induced many to exchange the noise and other annoyances of the former, for a more retired and rural residence in some part of the latter; and the merchant, the mechanic, and the lawyer find little inconvenience in carrying on their respective avocations in the city, while their homes and families are miles away from it. Riding in and out every day however, soon becomes irksome, and those who have it to do, as well as others who are making more extensive journeys in railroad cars, are very apt to resort to reading in order to pass away the time. As there is always more or less motion communicated to the whole body by the jar of the cars, and that motion is much increased in the extended arm and hand which holds the book or

paper, it must necessarily follow that the image made on the retina is constantly oscilliating, which obliges the eye to be put on a strain, in order to catch a distant perception of any small object, and especially when directed to distinguish small letters in continuous lines of words. This soon produces a sense of weariness and pain in the eye balls, and if persisted in very long, the sensibility of the optic nerve to the rays of light becomes weakened, the image on its expansion is blurred or confused and finally, if the organ is not relieved, it becomes altogether indistinct, and sight may thus be permanently injured or destroyed. Instances where this result has been produced to a greater or less degree, by reading while travelling in the cars, have come under our own notice, and many are on record where persons who travelled much by railroad, as Expressmen, &c., and practised reading while thus journeying, have become nearly blind. We think it therefore well to put our readers on their guard, as there may be many among them who are often exposed to the danger, and the loss it may inflict is one which far outballances the worth of any amusement or knowledge, that can be gained by reading while in the cars.

SUMMARY OF EVENTS.

EUROPE.—The steamship Arago arrived at N. York on the 6th inst., with London dates to Twelfth month 19th. The Arago brought 240 passengers and a cargo valued at more than two millions. There was no change in the Liverpool markets. The surrender of Kars to the Russians, is confirmed. Nine Pachas, together with General Williams and 16,000 troops, were taken prisoners. Upwards of 120 pieces of artillery fell into the bands of the Russians. The recent treaty with Sweden negotiated by General Canrobert, provides a guarantee of the territorial integrity of Sweden, and the latter engages not to alienate any part of her territory to Russia. The contracting parties also engage to communicate reciprocally all propositions coming from Russia. Rumors of peace were still abundant in both France and England. The army of Omar Pacha near Kutai consisted of 40,000 men. The Russians hold the defiles between Kars and Erzeroum; they are abundantly supplied with provisions by the Aremenians. All was quiet in the Crimea. Samuel Rogers, the poet, died in London on the 18th ult., at the age of 93 years.

UNITED STATES.—*The Patent Office* has been very active during the last year; one thousand nine hundred and forty-six patents having been issued in that time, which is the largest number taken out in any year.

Railroads.—The Railway Guide states the length of the railroads in the United States, at the commencement of the year, at 23,242 miles; the increase during the year amounted to 3,408 miles. New York has 2794 miles of railroad; Ohio 2725; Illinois 2215; Indiana 1789; Pennsylvania 1746. Ten years ago there were but 4870 miles in the whole country.

The Post Office.—The expenditures of the Post-office during the last fiscal year, amounted to $9,968,342, and the entire receipts to 7,342,136. The immense amount of printed matter now sent through the mails, either franked, or at low rates, and the great cost of mail service by the ocean steamers have greatly swelled the expenses of the department.

Public Lands.—During the year, 15,729,524 acres were sold, yielding in receipts $11,485,380. 8,827,885 acres were also located with military scrip or land warrants, and taken up under grants to States for roads and other purposes.

The Treasury.—The receipts, during the fiscal year ending Sixth month 30th last, from all sources, were $65,003,930; the payments, exclusive of those on account of the public debt, were $56,365,393. During the same period, the payments made for interest, and in redemption of the public debt, amounted to $9,844,528. The debt has been reduced to about $40,000,000. The balance in the Treasury, at the end of the fiscal year, was $18,931,976.

Congress.—The Senate has transacted but little business yet; that body is waiting for the organization of the House, and its doings, during the fifth week of the session, were a mere repetition of those of the four preceding. The members continued to vote for the same candidates, and with nearly the same results. The condition of the House affords a singular exhibition of the weakness and helplessness of the "collective wisdom" of the nation, under the prevalence of party rancour and sectional jealousy. A vote taken on the 7th, resulted as follows:—Banks, 101; Richardson, 73; Fuller, 29; scattering, 11.

Maryland.—The total debt of the State is $15,132,000. On $5,700,000 the interest is paid by corporations for whom the debt was assumed, leaving $9,432,000 on which the State pays interest. Of this debt, $3,426,000 is held by the sinking fund. The State finances are in a good condition, and the debt is no longer a source of embarrassment. The Governor, in his Message, opposes a reduction of the taxes, and recommends a competent public school system for the State.

New York.—The Legislature met on the 1st instant. The House of Representatives had not been able to organize during the first week of the session, on account of the members being divided into four or more parties, which mutually repel each other.

Pennsylvania.—The Legislature met and organized on the 1st inst. From the Governor's Message, it seems that the State Treasury is in a good condition, showing a balance of $1,245,697, without any loans having been required during the year. The actual receipts into the Treasury, were $5,390,474, and the expenditures including extraordinary disbursements, $5,385,705; a balance of nearly a million and a quarter was left over from the year previous. The extraordinary expenditures were for completing public improvements, and amounted to $1,246,193. The balance in the Treasury will be required to pay the interest due next month. The State debt, on the 1st of Twelfth mo. last, amounted to $41,967,996, being a decrease of $630,601 in the last year. It is estimated that the receipts for the current year will exceed the ordinary expenditures by one million and a half of dollars. The public works yielded $1,942,376, or $103,585 over all the expenditures, ordinary and extraordinary; or $794,013 over the ordinary expenses. A large increase in the business of the current year, is expected. The Governor renews the recommendation that the Main Line be sold, and thinks it would be a wise economy to sell the whole of the public works.

The Coal Trade.—During the year 1855, the anthracite coal sent to market, from the Schuylkill, Lehigh, and other regions in Pennsylvania, reached the large aggregate of 6,626,288 tons, being 778,986 tons more than in the previous year. The rapid development of this trade is shown by the fact, that the quantity sent to market, has doubled in the last five years. In 1850, it amounted to 3,332,614 tons.

Philadelphia.—The mortality in this city, during the first quarter of 1855, numbered 2499; in the second, 2492; in the third, 3315; in the fourth, 2325; total for the year, 10,581, making a weekly average of 203. The population being half a million, the mortality has been only about two per cent., or one death in every fifty. The coldest day in the year, was Second mo. 7th; the warmest, Seventh Mo. 18th; the mean average for the year, at noon, was 60.1, and the mean average temperature of Philadelphia at the same time, for 32 years, has been 62.04 deg. The mean temperature of the Twelfth month was 36.73°, which is 2° above the average of the last thirty years, and the amount of rain, 5.42 inches; at Trenton there was 5.35 inches of rain, and at Paoli, 6.43 inches. Interments last week, 214, of which 25 were from small-pox.

New York.—During the year 1855, the number of immigrants landed at this port numbered 136,253. In the year 1854, the number was 319,223. The mortality of the city for the year, has been 23,107, which is about 3.66 per cent. of the population as determined by the census of last year. The imports of merchandize for the year amounted to $155,901,000, being $33,191,000 less than in 1854. The exports for the same period amounted to $72,337,000; being $7,800,000 more than in 1854. Interments last week, numbered 367. During the year 1855, the New York butchers have slaughtered of beeves, sheep, lambs, veals and swine, the number of one million one hundred and forty-seven thousand five hundred and nine; averaging 22,067 per week. This is 1708 more than the average of the previous year, when the total number slaughtered was 1,058,690.

Baltimore.—The mortality of the last year, is stated at 5447, which is nearly 2.5 per cent. of the estimated population of 220,000.

Boston.—The mortality of the last year, was 4030 in a population of about 160,000; the ratio is nearly the same as in Baltimore.

Miscellaneous.—The Ohio River.—On the 4th inst., the navigation of the river was entirely suspended in consequence of the ice,

Pennsylvania Railroad.—During the Twelfth month, 1855, 10,058,872 pounds of merchandize were sent westward on this road, and the goods received at Phi[la]delphia, weighed 46,272,867 pounds. Included in t[he] ceipts were 86,465 barrels of flour and 177,699 b[us] of grain.

Cholera at Porto Rico.—Accounts from Porto R[ico] the 20th ult., state that cholera was making fe[ar]ful ravages on the north side of the island. In one [day] of 1000 inhabitants, 500 had died in the course [of] hours.

The Sugar Crop.—The sugar crop of Louisiana [will] fallen short of the average by about one half. In [some] sections the yield has been ordinarily good, but [the] failure has been marked and general.

The Coloured People of California.—At a recent [con]vention of coloured men held at Sacramento, the [whole] coloured population of the State was estimated at [about] with an aggregate in wealth of $2,375,000.

Money in the Treasury.—On the 29th ult., there [was] $22,753,700 in the U. S. Treasury, subject to draft.

The Florida Indians.—On the 20th ult., a part[y of] U. S. troops, who were engaged under the command [of] Lieut. Hartsuff, in making explorations of the [country] occupied by the Indians, were attacked by them. [The] party consisted of ten men, only three of whom escaped; it is supposed the others were killed.

Fire in Syracuse.—On the 5th, an extensive block [of] stores was destroyed by fire; loss over $150,000.

The Draining of the Harlem Sea.—The Chairman [of] the Commission on the Draining of the Harlem Sea, [has] published a final report on this work, which is [now] finished this year. The expenses from 1839 to [1855] inclusive, are $3,400,000, and the receipts from land [to be] sold is estimated at $3,200,000. It was at first [supposed] the reclaimed land would be worth only [about] $32 per acre; but in 1853 it was actually sold for [over] $120. This return exceeds all expectation, as the [draining] was not undertaken as a speculation, but as a [sanitary] caution against further inroads of the sea.

SOUP HOUSE.

The Society for supplying the poor of the city [with] soup, have opened their house, No. 16 Green's [court] and are daily delivering soup, (First-days excepted) between the hours of 11 and 1 o'clock, to such necessitous poor as produce a recommendation from [some] respectable person.

As the Society is dependent for means to support [this] useful charity, on the annual donations of the benevolent, they respectfully solicit aid from such as may be disposed to contribute. Donations in money may be sent to the Treasurer, Jeremiah Hacker, No. 144 South Fourth street, or to Thomas Evans, No. 180 Arch street.

Beef, flour, beans, rice or other vegetables will be gratefully received at the soup house.

WESTERN SOUP HOUSE.

The above was opened on the 3d instant, and the managers will be grateful for contributions in aid of their funds, which may be sent to

WILLIAM BIDDLE, cor. Arch and Eleventh sts.
SAMUEL L. BAILY, No. 252 Chestnut st.

WANTED.

A Friend in the wholesale dry-goods business, in want of a youth, 16 to 18 years of age, who writes a good hand, is quick and accurate at figures, and will to make himself generally useful. Apply at Friends' Bookstore, No. 84 Arch street.

Friends' Boarding-School for Indian Children, at Tunessassah.

Two women Friends are wanted at this Institution, to assist in the family.

Also, a man Friend to aid in carrying out the concern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTON

Appeal for the Ancient Doctrines of the Religious Society of Friends.

(Concluded from page 138.)

'e think it right to revert to an allegation in otation from one of the works first brought into * in which it is said that mistakes in the interation of certain Scripture texts, gave countento the errors of those who seceded from the Soin America, and aided "in the tremendous pro- " of their heresy. These alleged mistakes, as been shown above, are the views taken by our Friends of those texts. That the seceders npted to wrest many passages from the writof our early Friends, to support their own ions, is true; but those excellent writings fully cleared at the time, from the imputa- thus attempted to be cast upon them.

'e reject the pernicious errors of those who ded from us, and of all who deny the divinity ur Lord and Saviour Jesus Christ, regarding as a mere man, and who do not admit his h upon the cross to be the one great, univerffering and sacrifice for peace, atonement for and reconciliation between God and man. In ning that the gift of the Holy Spirit was not purchase of that sacrifice, whilst they still essed a belief in the guidance of the light of st, they were led by their own benighted rea- and imagination: and we testify that they entertain these unsound doctrines, have dec- ed from the teachings of the Holy Spirit, ch would have preserved them in the doctrines hrist and his apostles. And we further testify, a belief in, and faithful submission to, the rd manifestation of the light of Christ, which teth every man that cometh into the world, ld never lead any one to deny Him in his inprehensible fulness, as he is glorified at the t hand of the Father, nor to limit him to his itual appearance in the heart.

But we also object to many of the opinions and iments contained in the works under examion; and believing with Robert Barclay, that of the main characteristics of a true church, bear a joint testimony, not only "for the h," but also "against error," thus becoming one family and household;" we hold it to be merely the privilege, but the religious duty of whose eyes are opened in the light of Christ ee these things as they really are, to warn, and their brethren in religious fellowship upon ir guard, against opinions leading to consences dangerous to the integrity of the Society, and by the adoption of which the gracious designs of the blessed Head of the Church, in raising us up to be a people, might be marred or impeded.

A fundamental point of Christian doctrine, which our Society has always felt itself required to insist upon, as being of essential practical importance, is that of the necessity of attending to and obeying the immediate manifestations and teachings of the Holy Spirit in the heart. The beginning of the work of religion must be there. The Holy Spirit appears in the mind of every man, as the swift witness against sin; and it is in the light of its teaching that man comes to see the exceeding sinfulness of sin; true repentance and contrition, and the strength to forsake sin, are its gifts: as we regard its manifestations and obey its voice, we shall be led along in the path of duty, from knowledge to knowledge of the will of our heavenly Father concerning us: we shall experience Christ Jesus to be made unto us of God, wisdom, righteousness, sanctification and redemption. It is in the path of steadfast humble obedience, in which there is a growth in the Truth from stature to stature, that we are qualified rightly to understand the doctrines of the Gospel as laid down in Holy Scripture, and to be made partakers of the precious promises which they contain. While the mysteries of the kingdom are hid from the wise and prudent, they are revealed to the children of the Lord as he sees fit; and thus their faith does not stand in the wisdom of man, but in the power of God, manifested in their souls. The same divine Spirit which inspired the holy men to write the Scriptures, not only leads the disciples of Christ to a full belief of the sacred truths they contain, but also prompts to the frequent and serious perusal of them. The more faithful any are to the internal manifestations of the Spirit of Christ Jesus, the more will they love to read and meditate upon the sacred truths recorded therein, and conform their lives thereto; that they may be made wise unto salvation, through that faith of which He is the holy Author.

Yet as simple unquestioning obedience to the secret manifestations of the light of Christ in the heart, is the unfailing accompaniment of this faith; and as the substance of all religion is a holy self-denying life in the fear of God, our early Friends insisted upon the latter, both in their writings and discourses, as the thing of primary importance, and immediately concerning the salvation of the soul. But by insisting upon the paramount importance of the knowledge of doctrine, and the study of the Bible, a proficiency in these things may come to be regarded, equally at least with the taking up of the cross and the denying of the world, as the evidence of religious growth and attainment.

It is in this respect that such views tend to undermine the life of religion in the Society; and they do this, even when the form of sound words may be adhered to, and there may be no heresy in doctrine distinctly avowed. For such is the deceitfulness of the human heart, and the subtlity of the unwearied adversary, that man may imagine himself to be a believer in Christ, justified by his blood, and saved by his imputed righteousness, merely because he believes the doctrines of Holy Scripture; while he has never known the flaming sword, that keeps the way of the tree of life, to pass upon the transgressing nature, separating between the precious and the vile, and making him a true believer in Christ from the inward heartfelt knowledge of him as the wisdom of God and the power of God, that has brought him out of his fallen condition, and restored him to the paradise and image of God, which was lost by transgression. There is hence a danger of separating what our blessed Lord has done for us without us, from what it is indispensable to experience him to do for us within us; and of thinking that a man may be a true Christian because of his religious belief, and without his doing the will of God through submission to the power of the cross of Christ.

A religion adopted from study and reason, and stored in the memory, is, after all, so far as the individual is concerned, mere opinion, unstable and fluctuating, wanting in that clear and certain conviction which springs from heartfelt experience, and without that hold upon the conduct which marks the faith of the true disciple.

Not being grounded on the inward work of Christ upon the soul, this religion of sentiment rather than of experience, does not make obedience in the day of small things the essential condition of greater attainments; but rather reasons away these little requisitions of duty, as things of small account; and so tramples under foot the cross of Christ, and consents to an alliance with the spirit, and the pursuits, the maxims, and the manners of the world.

Being in its nature self-active and superficial, it may lead the preacher to frequent speaking in our solemn assemblies, without sufficiently regarding the indispensable necessity of waiting upon Him who is mouth and wisdom to the rightly anointed minister. Instead of speaking of what his eyes have seen, his hands have handled, and he himself has really tasted, of the word of life and of the powers of the world to come, under the putting forth of the Shepherd of the sheep; his preaching may be dry doctrinal discourses, or efforts of human rhetoric, unaccompanied by the baptism of the Holy Spirit, even though set off in the form of sound and scriptural words.

This religion of sentiment and opinion, if it supplants, in those who are called upon to sustain the order and discipline of the Society, the influence of the heart-changing and illuminating power of the Spirit of Christ, effectually blinds the eye, and disqualifies the mind for judging rightly in the important concerns of the church.

As it affects the minister, so must it affect the elder; who would be no longer prepared to try words as the mouth tasteth meat, or to distinguish the plain unsophisticated gospel ministry, which stands in the demonstration of the Spirit and of power, from the rhetoric of the fluent preacher, which fails to wound the man of sin.

Should this superficial religion prevail, it would introduce the spirit and the maxims of the world into the very bosom of Society. Our meetings for worship, instead of being held in the name and power of Christ, might be rendered opportunities

* Brief Remarks on Impartiality in the Interpretation of Scripture, by J. J. Gurney.—*Ed. of Friend.*

for bold and popular preachers to lead astray the people from the true fold. Having rejected the Guide of life, we should be left to choose our own paths, and should inevitably fall into confusion and error. For if we cast aside our fundamental principle of the guidance of the Holy Spirit, and the government of the Head of the Church, we shall assuredly become the prey of unbelief and anarchy.

The present is a day of deep trial and sifting within our borders. The enemy of truth and of the soul's salvation, has succeeded by various stratagems in marring the beauty and peace of Zion, and it behoves all those who are desirous of seeing the waste places built up, and the former paths restored, to put shoulder to shoulder, and walking by the same rule and minding the same thing, rally to *first principles*, and labour harmoniously in the great work of our day. It is from a fervent desire to be found thus engaged in the Lord's work, and from no wish to cast censure upon individuals, that we have felt ourselves constrained to make the preceding exposition; and it is our earnest desire, that all our members, while showing feelings of kindness and true Christian charity towards each other, may be aroused to a clear sense of the danger which threatens our Society, and be willing, humbly and fervently to enter into an examination, how far they are contributing to hasten or to avert it.

The Lord will have a tried people to show forth his praise. And if we are not willing to maintain our allegiance to him, if we let fall the banner which he has given us to display because of the truth, we shall be rejected; and others will be raised up who will exalt those pure doctrines and testimonies which the Lord Almighty qualified primitive Friends to live up to, and to preach with holy zeal, in the pure language which was restored to them.

Against these dangers which threaten the Church, there is but one defence—a hearty and practical return to First Principles. The light of Christ which shineth in every heart, which is the swift reprover of sin, and shines more and more in the humble and obedient soul unto the perfect day, will, if we follow its guidance in all things as it makes them manifest, lead us into all truth and unto all humility and holiness.

Were we enabled, through Divine favour, to come up more fully to that degree of watchfulness and obedience which our predecessors in the truth experienced, how great a change would take place among us! How circumspect would be the conduct, how guarded the conversation of our members! Their desires being after the things that pertain to the soul's salvation, they would not suffer the pursuit, and the accumulation or the pleasures of riches, to engross their affections. Keeping before them the fear of the Lord, and the blessed precepts and example of the Divine Master, they would be marked by self-denial, moderation and humility in all their walking. Our testimony to Christian plainness and simplicity would be maintained in the avoiding of a compliance with the customs and fashions of the world, in the furniture and decorations of our houses, and in our manner of living and entertaining company; compliances which have long been increasingly prevalent with many among us, and which feed the vanity and pride of the creature, and render the lives of those who thus conform to the customs of a vain world, a practical contradiction to their holy and self-denying profession.

This humble consistent walking, a godly zeal, the love of each other in that fellowship which is in the ever blessed and unchangeable Truth, would again distinguish us as a people, and it would again be said of us as of old, "See how these Quakers love one another!"

Were we thus unreservedly to submit to the turnings and overturnings of the Divine Hand upon us, individually and as a people, Truth would rise more and more into dominion in our religious assemblies; messengers of the everlasting gospel would, in the Lord's own time, and according to his own pleasure, be sent forth as of old; judges as at the first and counsellors as at the beginning, would be known amongst us; our meetings for the transaction of the Discipline would be increasingly weighty and edifying; forward and self confident spirits would stand rebuked in the authority of Truth; the shout of a king would yet be heard in our camp; and He who has hitherto helped us, would still condescend to be to his stripped and peeled people, the Healer of breaches, and the Restorer of paths to dwell in.

Modern Discovery.—In the course of a lengthy and able article in the New York Tribune, we find the following summing up of the achievements of discoverers within the last quarter of a century:

"Within the last twenty-five years all the principal features of the geography of our own vast interior regions have been accurately determined; the great fields of Central Asia have been traversed in various directions, from Bokhara and the Oxus to the Chinese Wall; the half-known river systems of South America have been explored and surveyed; the icy continent around the Southern Pole has been discovered; the North-western Passage, the ignis-fatuus of nearly two centuries, is at last found; the Dead Sea is stripped of its fabulous terrors; the course of the Niger is no longer a myth, and the sublime secret of the Nile is almost wrested from his keeping. The Mountains of the Moon, sought for through two thousand years, have been beheld by a Caucasian eye; an English steamer has ascended the Chadda to the frontiers of the great Kingdom of Bornou; Leichardt and Stuart have penetrated the wilderness of Australia; the Russians have descended from Irkoutsk to the mouth of the Amoor; the antiquated walls of Chinese prejudice have been cracked and are fast tumbling down, and the canvas screens which surround Japan have been cut by the sharp edge of American enterprise. Such are the principal results of modern exploration. What quarter of a century, since the form of the earth and the boundaries of its land and water were known, can exhibit such a list of achievements?"

In the same interesting article is the following statement of the progress of discovery in Africa:

"We learn also, from South Africa, that C. J. Anderson has succeeded in penetrating from Walwich Bay, on the western coast, to the great Lake N'gami, discovered four years ago by Dr. Livingston. He there heard of the existence of a large town called Liberbe, nineteen days' journey to the north-east, which was said to be a great place of trade. Dr. Livingston, who made his way northward from the Cape of Good Hope to lat 10. south, came down unexpectedly on the Portuguese town of Laonda last winter, and then went back into the wilderness, will probably come to light again in another year, and we shall then have the result of the most important exploration of the southern half of the African continent, which has ever been made. There now remains but a belt of fifteen degrees of latitude to be traversed to enable the explorers of the north to shake hands with the explorers of the south. In less than twenty years their trails will touch, and the secret of Africa be won!

From "Old Humphrey's Portfolio.

Sweet Soothing.

If in this world there are many things that harsh and irritating, there are also many w are sweet and soothing; nor can we do better garner up the latter in our memory, as anod to the daily cares that ruffle our tempers and stroy our repose. The mind is more peaceful contemplating a calm, than in dwelling on a sto and we benefit ourselves more by reflecting on meeknsss of the lamb than in pondering on ferocity of the wolf.

How sweet and soothing it is at the end day of care, passed in the battle of life, and am the hard ways of men, to find ourselves once n in the calm quietude of a domestic home, sole by the soft voices, and the kindly deeds of th we truly love! It is an oasis in the desert to pilgrim, or as the gentle breeze and cup of water to the thirsty and toil-worn traveller.

It steals the sting from every care,
The smart from every wound;
When love and tenderness prevail,
And gentle deeds abound.

It is said that, in the "Repos du Berger," Shepherd's Rest, a hollow cleft in the Col de Juli one of the Central Alps, where once existed a li colony of pious Vaudois, there is now scarcel trace of home and habitation. The long grass and wild weeds grow freely there, and the l makes her nest among them and sings. There something sweet, nay, very sweet, in the l building her nest in the ruined homes of a by-g generation of pious people, taking up, as it we the song to her Maker where man had laid it do and thus practically proclaiming the words of last verse of the last of David's Psalms, "L everything that has breath praise the Lor

There is often much that is sweet and sooth to be obtained from the outward creation, wh the mind is in such a frame that it can take temporal things and turn them to eternal purpo It was thus with me the other day when walki in the open fields. I came suddenly upon an blasted elm tree, that had no green leaf upon and only one branch; but that one, after striki out from the stem, abruptly altered its direct and pointed to the clouds. "A lesson for me my age," cried I; "while I have an arm, a ha a finger, yea, while I have my being, O may t last desire of my heart, like the remaining bou of the blasted tree, be still found directed to skies."

Hardly can we forget the sweet and sooth influence which sometimes steals upon the mi when witnessing children in their childish spor The merry laugh, the joyful spirit, the tender c shown toward the youngest of the group, t simple sources of their gratification, and the l that binds them together, all seem to read a less to the wrinkled brow and careworn heart of m Why cannot we, like children, be contented w little? Why cannot we all be like one anothe Few thing are more sweet and soothing than a w in the open air, after an illness that has long c fined us within doors. Pain has subdued us, a fever has pulled us down, but we begin to ta heart and hope; with a pale cheek and a langu frame, clothing ourselves for the occasion, venture for the first time abroad. Leaning on stick, feeble and tottering, we proceed, wonderi at our temerity, till all at once, on turning t brow of the hill, the fresh breeze salutes us, t pleasant sunbeam cheers us, and the green fie stretching out before us greatly minister to delight. We feel as he felt who was told to ta up his bed and walk. We know that the migh hand of God is upon us for good. Our hea

within us at the remembrance of his mercy, with swimming eyes and a faltering tongue tammer out his praise.

"Thy hand alone, Almighty Lord,
Restored our fleeting breadth;
Renew'd our strength, and led us forth
From sickness and from death."

metimes, without intention on either part, an ation takes place between Christian friends, e great grief of both; and, O how sweet and ning it is to find out at last that the whole nated in a mistake, a mere misunderstanding, that in reality, after all the bitterness and w occasioned thereby, there never was at the m of the crucible of each other's hearts anyg but Christian love and Christian kindness. ho has not in the deep slumbers of the night under the dominion of some terrible dream? e dreadful danger is at hand, from which there escape. Some fault has been committed by verwhelming us with shame and confusion; me long-dreaded evil has come upon us that ves us in irrevocable ruin. Sweet and soothit is indeed, in such a fearful crisis, to awake find it nothing but a dream. Instead of dis- and terror, and despair, all is joy and thanks- ss. He who neither sleepeth nor slumbereth, kept us through the night, restored our facul- for the day, and put a new song in our mouth, praise and thanksgiving to God.

fter the bereavement of a dear relative and d, when the sorrowing heart has raised an n of rebellion against its Almighty Maker, g in question his inscrutable decrees, and ing to be comforted, there is something in- essibly sweet and soothing, when subdued by w, our rebellious thoughts and idle feelings vithin us, and we are enabled by divine grace ile amid our tears and say, "I know, O Lord, thy judgements are right, and that thou in fulness hast afflicted me." Pss. cxix, 75. hat we could always seek this solace in our vements, instead of madly doing battle against Lord of hosts; for "who hath hardened himgainst him, and hath prospered?" Job ix. 4. ho, when in the flood of affliction the waters ared to go over his soul; or when in fiery the furnace has seemed to be seven times r than usual, has lighted, seemingly by acci- on that heart sustaining text of the Scripture, hen thou passest through the waters, I will ith thee; and through the rivers, they shall verflow thee; when thou walkest through the thou shall not be burned; neither shall the kindle upon thee; for I am the Lord thy the Holy one of Israel, thy Saviour," Isa. 2, 3,—without finding and feeling it to be t and soothing? In such a season the con- ion comes, "not as the word of men, but as in truth, the words of God." 1 Thess. ii. 13. ch are some of the sweet and soothing ingre- s in the cup of our existence; but sweeter, ps and more soothing and encouraging than the joyous moment when the saddened soul Christian man, suddenly enfranchised from ts and darkness and the fear of death, tem- and eternal, is enabled by faith fully to be- and exult in that glorious declaration of his emer, "I am the resurrection and the life; hat believeth in me, though he were dead, yet he live; and whosoever liveth and believeth e shall never die." John xi, 25, 26. Thus t liberty, the newly awakened soul springs rd in a path the eagle has not known, full of , and life and immortality,

'Tis something like the burst of death to life
From the grave's cerements to the robes of heaven;
Om sin,s dominion, and from passion's strife.

To the pure freedom of a soul forgiven;
Where all the bonds of death and hell are riven;
And mortal puts on immortality;
Were mercy's hand hath turned the golden key,
And mercy's voice hath said, 'Rejoice, thy soul is free."

For "The Friend."

On Shooting Stars and Meteorites.

(Continued from page 135.)

In the following cases of the appearance of meteors, explosions were heard, but no stones were found to have descended to the earth.

Third mo., Ninth, 1822. An extraordinary meteor was seen in New York; being about two thirds the apparent diameter of the Moon. It exploded with a noise equal to that of a cannon, and the sound reached the observers in about 7½ minutes after noticing the explosion. An eyewitness thus describes the occurrence. "I first saw a sudden flash of light which appeared to extend from the heavens to the earth, and was followed by a momentary darkness as if a cloud had passed over and intercepted the light. This darkness was soon dispelled, and the blazing meteor was in full view over my head, appearing to be twenty or thirty feet in diameter, and soon began to extend itself to the north-east and south-west, increasing in extension and decreasing in flaming appearance, until nothing was seen but two detached parts of it rapidly moving in different directions towards the north-east and south-west. This appearance lasted from five to six minutes. One account states that it appeared five or six feet in diameter, and brighter than the most vivid lightning or the mid-day sun.

Another observer mentions that it passed within three hundred or four hundred yards of him, and burst with a violence which seemed to "throw all nature into convulsions." It discharged "its massy balls of electric fire in every direction, but they all disappeared before they reached the ground, leaving in their train an astonishing mass of liquid fire, which remained after the explosion for the space of ten minutes, and then gradually disappeared like the rainbow." This meteor was seen at Montreal, Quebec, Saratoga, Boston, Bennington, Utica, Rhode Island, Pennsylvania, and various other places. Numerous observations taken of its altitude result in establishing it at from thirty-four to forty-one miles above the earth's surface.

Its diameter was one-third of a mile, and the beginning and termination of its flight as observed was from near Burlington, Vermont, to Wilkesbarre, in Pennsylvania; during which its velocity exceeded that of the earth in its orbit. When it exploded it threw off scintillations like a rocket, and the report was heard for a distance of sixty miles.

1850. Sixth mo. 16. A brilliant meteor was seen at New Haven, Connecticut, in full daylight, being an hour before sunset. In size it was comparable to the planet Venus, and was followed by a train a degree in length.

1850. Ninth mo. 30th. Another magnificent areolite was observed in New England. It exploded, projecting a portion of its mass forward about two degrees, leaving a brillant train eight degrees long. In three minutes this train assumed a serpentine form, half a degree broad and ten degrees long. Presently the front portion drew up its head like a serpent, and curved it round. It was first noticed near 9 P. M. At 9 h. 7 min. it resembled Halleys Comet, and then commenced a slow motion, at the same time rotating rapidly on a point corresponding to the nucleus of explosion, and expanding rapidly in all directions. At 9 h. 28 min. its body extended in breadth twelve degrees, and its longest diameter reached to the zenith. It remained visible more than an hour. Vertical height estimated at 50 miles.

Dr Bowditch has entered into very elaborate calculations respecting the Weston meteorite, before alluded to. Its path was parallel to the earth's surface and about 18 miles in height, being one mile higher at the moment of explosion than when first seen. The length of its path was 107 miles, and duration of visibility 30 seconds. A. C. Herrick, thinks it certain that much the largest portion of this meteorite passed on in its course after its disruption. He estimates its absolute velocity in space at 20 miles per second, and considers it a satellite of the earth.

The largest meteoric masses as yet known are those of Otumpa, in Mexico, and of Bahia, in Brazil, being from seven to seven and a half feet in length.

The celebrated stone of Ægos Potamus, which is said to have fallen about the year in which Socrates was born, has been described as the size of two millstones, and equal in weight to a full waggon load.

The composition of these bodies forms a subject of much interest, as connected with the question of their origin. Of the simple substances hitherto detected in them, there are eighteen, viz.: Oxygen, sulphur, phosphorus, carbon, silicium, aluminium, magnesium, calcium, potassium, sodium, iron, nickel, cobalt, chromium, manganesium, copper, tin, and titanium. They are divided into two classes, according to their external appearance. Those of one class present in an apparently homogeneous mass, grains of meteoric iron. The other class is free from metallic admixtures. The first, or metallic variety is much the most numerous, and the different specimens exhibit a very remarkable identity of form and chemical composition, so plainly distinguishable from any other terrestrial object, that a connoisseur is able to pronounce one of these bodies as of undoubted meteoric origin, without previous information as to its history, by a simple examination of its structure. The most striking and constant of these peculiarities, is the black crust or coating with which they are surrounded, of a glossy shining appearance, as though they had passed through intense heat for a few moments, which had fused the outer surface. The crust is but a few tenths of a line in thickness, and is divided from the interior gray mass by a sharply defined line of separation. They all contain *unoxydized malleable* iron in its pure state. That is, not mingled with the oxydes in the form of ores, such as we ordinarily find it in the earth, but in its abstract condition, all ready for the blacksmiths forge, so that in one instance a sword was made from the iron of a meteorite. Besides the iron, (which varies materially in quality in the different specimens,) Nickel and Cobalt, are generally found in the greatest proportions; and phosphorus is rarely absent. It is worthy of remark that none of these elements, viz., iron, nickel, cobalt and phosphorus, are *ever* found in the earth *uncombined* with oxygen; but in the first class of meteorites are *never* combined with it.

The second class of meteorites have a stony structure, usually of a greenish gray colour, and are readily broken by a blow of the hammer.

The proportion of iron as before stated varies greatly in different instances. For example, the meteorites brought by Humboldt from Mexico, contained ninty-six per cent of iron, whilst those of Siena contained but two per cent.

There is much diversity of sentiment among those versed in this branch of natural science, respecting the origin and process of formation of these singular bodies. Formerly it was almost

universal to refer them to the same source as the shooting stars, and to consider them identical in character and composition, but modern observations are evidently weakening this belief, and affording strong proof of their dissimilarity, and distinctness in both these respects. Some eminent philosophers have adhered to the belief that they were the product of the combination of certain gases in the upper regions of the atmosphere, through the agency of electrical excitation. Others have ascribed them to the dust and earthy particles, which are carried by the force of the winds into the air, being conglomerated into solid masses by galvanic force—but these theories have been entirely exploded by the results of some accurate measurements of the altitude of fire balls. Brandes and Benzenburg, (two well known German observers,) by taking a base line 49,020 feet in length, and ascertaining their parallax, computed the heights of a number of shooting stars and meteorites at distances varying from 16 to 400 miles. Now the atmosphere at the height of 50 miles from the earth's surface becomes so rare as to be virtually null, so that it is impossible that a solid mass of iron and stone should owe its origin to atmospheric products, at an elevation of 400 miles. And in addition to this the enormous velocity attained by these bodies (being from 18 to 36 miles per second,) is vastly greater than they could acquire by gravity alone, if their flight commenced within the known regions of the atmosphere.

(Concluded next week.)

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 140.)

JOHN LEE.

John Lee resided in Gloucester county, England, previous to his removal to America, and he, as well as Hannah his wife, were acceptable ministers. The certificate for themselves and family, was presented to Philadelphia Monthly Meeting, in the Eleventh month, 1700; but they soon removed to Chester county within the limits of Concord Monthly Meeting. Of Hannah Lee, we have little information. We find her attending the Meeting of Ministers, and in 1714 visiting Great Britain, in order to secure some property, the legal steps to be taken, requiring her presence. Her labours were probably chiefly at home, and within the limits of the meeting to which she belonged. Her husband was called to more laborious service.

In the Seventh month, 1702, he was liberated by the General Meeting of Ministers, to visit West and East Jersey, and Long Island. From the report it appears to have been a time of favour to the visitors and visited. There was, especially on Long Island, great openness in those not of our Society, and there had been recent convincements. In 1710, and again in 1720, we find him travelling through New England, on religious service, and many times attending the Yearly Meetings of Worship held in divers places, in the neighbouring provinces. Of his labours in the many meetings he attended, we have little account, except such as is afforded by the return minutes of unity given him, and brief remarks that meetings were "well." He was often a representative to the Yearly Meeting, and sometimes was on the committees of that body to prepare epistles to other Yearly Meetings. On the 22d of the Fourth month, 1726, a daughter of his was married at Springfield, Chester county. His particular friend, Thomas Chalkley, was invited to the marriage of which he gives this account.

"I was constrained to speak mostly to the young people, advising them to seek the Lord in that great affair of marriage, that they be careful on whom they set their affections, and not to draw out one another's minds, if they did not intend an honourable marriage;" "and that they be chaste and true in their proceedings, duly regarding the advice of the apostle, 'Be ye not unequally yoked;' for all such marriages are unequal, when those who marry are of different principles of religion. The meeting ended with tender supplication for preservation through whatever exercises, further troubles or trials, temptations or afflictions, we might meet with in the world, that so we might end well at last, and live forever to praise and glorify God and the Lamb, who, through the holy, eternal Spirit, is worthy forever."

About the 26th day of the Tenth month of that year, John Lee deceased. Of his sickness we have no information. Thomas Chalkley says, "The 27th of the Tenth* month, I heard the news of the death of my dear friend, John Lee, by one sent to desire my company at his burial. It affected me with sorrow, he being an old acquaintance and friend of mine, with whom I had travelled many miles. He was a loving, serviceable minister of the gospel of Christ, and instrumental to convince divers of that principle of Divine light and Truth which we profess. I could not be at his burial, because of my indisposition, and the unseasonableness of the weather; yet I think it my duty to say this concerning him, that our love and friendship were constant and entire unto the end, having been acquainted about thirty-five years, as near as I can remember."

DAVID MERIDETH.

David Merideth was born in Wales, about 1637. He was one of those early convinced in Radnorshire, and we find him, in 1660, suffering for his testimony to the Truth. In the Eleventh month, 1663, he with others were committed, because they were conscientiously restrained from taking an oath. He continued faithful, and towards the close of the century, he removed to Pennsylvania, and was one of the second set of purchasers of the land about Plymouth.

In his old age he was appointed an elder, having doubtless for a long period been an elder in the Truth. He possessed in a great degree the love and esteem of those who knew him. Thomas Chalkley, early in the Fourth month, 1726, writes thus, "Called to see my old friend, David Meridith, who being about eighty-nine years of age, I thought it probable I might not have another opportunity of seeing. He met me with gladness, and told me it was their meeting day. So I staid, and was much comforted and tendered by the power of Christ."

As Thomas thought it might be, so it proved the last opportunity of visiting his venerable Friend. In the following Eleventh month, his spirit escaped from it fleshy abode. His friends say of him, "He was of an orderly life, careful in attending meetings, of a good example in his family, and departed this life in good esteem amongst us."

MARTHA THOMAS.

Of Martha Thomas, wife of Reese Thomas, of Radnor, I find no other account than this. She was "a worthy elder, zealous for good order in the church, and exemplary in her family." She

* Thomas Smith says, the death took place in the Eighth month.

was "buried the 9th of the Twelfth month, 1 at Friends' burying-ground, at Radnor.

MARY ROUTLEDGE.

This Friend was a native of Skipton in Y shire, where her friends say she suffered o count of her religious profession. She was vinced in her youth, and married William F ledge, but whether it was before or after removal to this country, we have no means o certaining. Her friends say of her, "She w the ministry for a considerable time of the l part of her life, was very serviceable, and very ancient, and in unity with her Frien Her decease took place near the close of 172

CALEB PUSEY.

Caleb Pusey was born in Berkshire, Old B land, in the year 1650 or 1651. His educa was among the Baptists; but, after arrivin years of maturity, he joined the Society of Fri through convincement. He, after this, remo to London, from which place, in the year 1 he came to Pennsylvania, and settled near C ter. Being a man of good natural understand he was much looked up to by his neighbours, frequently elected him to represent them in assembly of the province, when he was not ser as one of the council.

Caleb Pusey was a man of great coolness mind and personal courage. In the year 1 many rumors were spread abroad through Pe sylvania, that the Catholics had been tampe with the Indians, to induce them to slay all heretics, that is, the English who were at time almost exclusively protestant. These run had excited suspicion, and awakened distrust very great degree, when two Indian women West Jersey, whether influenced by liquor or ger we know not, declared that on a certain then near at hand, the Indians intended to kill the English settlers in those parts. On hea of this assertion, the panic became general amon those who had not learned to lean upon the L in the day of trouble, to wait on his Spirit counsel, and to trust in his Providence for pre vation. The day designated came in due cou the usual order and quiet of the province of Pe sylvania was undisturbed, and the timid and fa hearted began to take courage when the went down, leaving as far as they could the whole country in peace. This state of tr quillity was soon broken. About 10 o'clock t night, a man came into Chester, proclaiming alarming intelligence, that Indian hostilities massacre had commenced. The members of th families, who had resided about nine miles fr that place, were, he said, all killed by the Indi A Friend, at that time in Chester, taking young men with him, started about midnight, rode to the scene of the alleged massacre. three houses were empty, but no sign of blo shed could be found around them. The inha ants, they subsequently discovered, alarmed at report of the evil intention of the Indians, fled to the dwellings of their parents on Rid Creek. The head of one of the families be from home, was informed that five hundred dians were collected at Naaman's Creek, intend to commence the war of extermination with English. He started immediately for his dw ing with his feelings wrought up to a high st of excitement. On going along, his fears act on his imagination produced wonderful effe He supposed he heard his boy crying, and sayi "What shall I do, my dame is killed!" Inst of proceeding to his house, to examine into w really had happened on the faith of an imagin

, he started for Philadelphia, to inform the rnor of the supposed terrible catastrophe. e went, he met an acquaintance, who, learning rrand, and the slender foundation he had for ory, persuaded him to return. The rumor, ver, was soon carried into the city by others, messenger was sent to Marcus Hook, to in- into the truth of the report. He met with ed and excited inhabitants, from whose state- s it appeared that the account was true, ex- that the Indians were a little further off, at f their villages on the Brandywine. He was over informed that the Indian king being they had sent him away with their women hildren, and that five hundred warriors were assembled. These circumstances seemed to m that there was an evil intention in the ns, and to the apprehension of the citizens ally, the rumor had become a certainty. e council and assembly were at that time sit- in Philadelphia, and Caleb Pusey was there, e discharge of his duty. On the return of messenger with the above news, he imme- ly offered if five others would accompany him ut any weapons, to go to the Brandywine, earn at the Indian town itself, the truth of eports. Five courageous men soon offered, without molestation they rode to the place, e they found the old king quietly reclining at ase, his head on a kind of pillow, and his foot resting on the ground. The women at work in the fields; the children were mer- at their play; there was no sign of warriors aring for battle, but things all indicated ort contentment and peace.

e king mildly asked them, "what they all e for?" They told him the report spread by women, and inquired if the Indians had any- against the English. In answer, he said, e women ought to be burnt to death," add- "we have nothing against the English." rwards he said, "'Tis true there are about n pounds yet behind of our pay for the William Penn bought; but as you are on it, and improving it, we are not in haste our pay; but when the English come to settle we expect to be paid." The messengers ght this reasonable, and told him the Indians d undoubtedly be paid for their land.

(To be continued.)

Selected.

THE POOR AND AFFLICTED.

Go wipe the tear drop from the eye
Of the poor sufferer, sad and lone—
Go when the tempest's storm is high,
And wait not for a brighter sun;
Forget thine ease and selfishness,
And lay thy vain excuses by—
Go seek the suffering *now* to bless,
And on thy angel mission fly.

What though no silver trump of fame
Should echo notes of sweet applause,
What though no mortal heed *thy name*
Or doings in such holy cause?
What though no garland wreath should twine,
Or fading chaplet round thy head?
There is a luxury sublime
In goodly deeds on suffering shed.

There *is* a voice; 'tis sweeter far
(The Spirit whispering within)
Than earthly notes of flattery are,
Mixed up with vanity and sin;
There *is* a smile I'd rather see
And hear His voice, than all things else,
"Ah, thou hast done it unto Me,"
And sure shall be thy recompense.

'Tis Grace alone, we by experience find
Imparts instruction to the attentive mind
Convicts of error, and reproves for sin,
And what these are, it manifests within.

For "The Friend."

Christ, the Only Foundation.

It is positively declared that "other foundation can no man lay than that is laid, which is Jesus Christ." And we may rest assured, that, unless we build on this foundation, all our building will be in vain, and we shall suffer loss; for, however lofty and imposing our superstructure may appear in our own eyes, it will perish in the fiery trial that must ultimately prove all our works. If our works, not being on the only abiding foundation, are destroyed, we cannot "receive a reward." How, then, will our lofty expectations sink, and our spirits fail within us, as we behold all that we have laboured so assiduously to rear, swept away. Naked and unsheltered as we must stand, we will desire the rocks to fall on us, and the hills to cover us, that we may be hidden from the frowns of our offended Creator. Then, and not till then, can we fully comprehend the mournful depth of meaning that the lamentation conveys,—"the summer is past; the harvest is ended, and we are not saved." Could we now but faintly conceive, or feel a tithe of the awful sense of misery and woe that will then press upon us,—lost and undone beyond redemption,—surely we would hasten to accept the offers of salvation, which, in great mercy, and with much long-suffering to us-ward are extended to us; surely we would no longer grieve the Holy Spirit, and quench its manifestations, but would submit ourselves entirely to its guidance, in order to escape so great condemnation.

When He is pleased to visit us with a sense of this condemnation, and to show us how utterly insufficient all our airy building is to save therefrom, let us humble ourselves, as into the dust; let us dig deep, whilst the light of the day lasteth, so that when the night cometh, we may be found deeply centred on Christ Jesus, "the foundation of God" which "standeth sure."

Ohio, Twelfth mo., 1855.

From "The Leisure Hour."

The Winter Sleep of Animals.

Most, perhaps all, animals sleep or repose at given intervals, after certain periods of longer or shorter duration devoted to active exercise. This oblivious rest is necessary for the restoration of the energy of the nervous and muscular systems, when that energy is exhausted by fatigue. There is, moreover, a tendency to sleep, or at least to rest quiet after repletion; and in hot countries men and animals take their siesta during the fervid heat of mid-day; narcotic drugs produce sleep, by tranquillizing an irritable condition of the nerves, but in over-doses they produce *coma*, which is not true sleep, and which may end in death.

Distinct alike from true sleep, and its similitude coma, is a species of lethargic insensibility, ordinarily called *the torpidity of hybernation*. This torpidity is either perfect or imperfect, and it varies in duration All animals do not fall into this condition, although many do; it occurs at a fixed period of the year, continues for weeks or months, passes off, and leaves the animal to the exercise of its wonted energies, and to its usual alternations of activity and repose.

The term hybernation means retirement into winter quarters; but, in the present instance, also supposes a condition of torpidity when in that winter retreat. In our northern latitudes, all our reptiles hybernate. Many of our quadrupeds do so also, but none of our birds; for to them is given the instinct and the power of migration.

As examples of hybernation among quadrupeds we may notice the marmot of the Alps. This animal excavates a deep burrow, in which it makes a bed of dried grass and moss, and to this asylum it retires in autumn, stops up the entrance, lays itself placidly down, and falls into a state of torpor which lasts till the beginning of spring.

The pretty little dormouse also hybernates. It makes a domed nest, generally in the crevice or chiuk of a tree, sometimes amidst the interlacements of the thickest part of a dense brake or tangled mass of brushwood, and in this snug dome-covered dormitory, made of moss, grass, and leaves, it coils itself up into a ball and waits the approach of sleep. The hedgehog hybernates; forming a warm soft nest of moss and leaves, under the root of some old tree, in the hole of a bank, or under the covert of haystacks, masses of timber or logs, it there rolls itself up like a ball, and sinks into torpidity.

Bats likewise hybernate, some more profoundly than others. They seek the hollows of trees, the recesses of old ruins, church towers, barns, caves, and similar retreats, making no nest, but hanging suspended by the hinder claws. Some hybernating animals, as the marmot, lay up a store of provisions for consumption in early spring, when, although the trance is over, other food is not attainable.

Instinct impels all hybernating animals to seek at a definite period their winter asylum; and, thus instinct-guided they never fix upon a wrong situation. In every case the aim seems to be the securement of a shelter from extreme cold, so as to preserve the maintenance of a degree of temperature conducing to a peculiar condition of the system, without involving the loss of the vital principle; for extreme cold, as experiments have proved, does not produce torpidity in these animals, but death. If, for example, we expose an animal which naturally becomes torpid at a certain season of the year to excessive cold, and allow it no opportunity of sheltering itself, it will certainly perish. On the other hand, if we subject an animal in a state of hybernation to excessive cold, the shock will revive it; but let it continue in that cold medium for a short time, and it will die. Artificial warmth will revive an animal in its torpid state of hybernation, but not without injury.

Bats and dormice thus awakened, seldom or never survive after being so unnaturally roused. "Animals which hybernate at a certain period of the year in obedience to a protective law, will not hybernate if exposed to cold at another season; and if the cold be intense, they will perish, as was proved by the experiments of Mangili." Moreover, the degree of temperature at the time when animals seek their hybernating retreats is often higher than that of the spring month, when their revival takes place.

A truly hybernating animal in its torpid condition presents us with the semblance of death: we can perceive no breathing, no motion of the heart, no vital warmth; wounds inflicted seem to give no pain. We may roll a hedgehog over the floor, or a dormouse over the table, and they exhibit no signs of consciousness; they are under the influence of nature's preservative chloroform.

This is a slight sketch of what we ordinarily term hybernation. Let us reverse the picture, and present to our readers the sketch of a contrary state of things. Hybernation means *torpor in a winter retreat*. Let us contrast it with estivation, which means *a like torpor during the intense heat* of the dry season, or summer, in the hotter latitudes.

In inter-tropical climates a continuance of heat and extreme dryness produces the same effects on animals as does the cold of winter in our temperate latitudes. Life appears to stagnate; torpidity assumes the dominance; the forest is still, as if destitute of its native wild tenants, for the birds

either seek the densest coverts or migrate to other localities. We quote, with some omissions, the following extracts from Darwin's interesting Journal, as calculated to give a true picture of this animal torpidity during the season of heat and drought.

"When we first arrived at Bahia Blanca (South America,) September 7, we thought nature had granted scarcely a living creature to this sandy and dry country. By digging in the ground, however, several insects, large spiders and lizards, were found in a half-torpid state. On the 15th a few animals began to appear, and by the 18th, three days from the equinox, every thing announced the commencement of spring. The plains were ornamented by flowers of a pink wood-sorrel, wild peas, œnotheræ, and geraniums. The birds began to lay their eggs; numerous insects were crawling about; while the lizard tribe, the constant inhabitants of a sandy soil, darted in every direction." "It is well known that within the tropics the *hybernation*, or more properly *æstivation* of animals, is governed by the times of drought. Near Rio Janeiro, I was at first suprised to observe that a few days after some little depressions had been changed into pools of water by the rain, they were peopled by numerous full-grown shells and beetles. Humboldt has related the strange accident of a hovel having been erected over the spot where a young crocodile lay buried in the mud; and, he adds, the Indians often find enormous boas, which they call uji, or water-serpents, in the same lethargic state. To reanimate them they must be irritated and wetted with water."

As the rainy season comes on suddenly—so, far more suddenly than in our climate, where the transition from winter to spring is gradual, does animal reviviscence, with a restoration to full activity, take place. To this singular torpidity of animals during heat and drought, Baron Humboldt expressly alludes when, speaking of the tanrec, a hedgehog-like animal of Madagascar, he says: "As in the cold zone the deprivation of heat causes some animals to fall into *winter sleep*, so in the hot tropical countries an analogous phenomenon occurs, which has not been sufficiently attended to, and to which I have applied the name of *summer sleep* (estivation.) *drought and continuous high temperature act like the cold of winter in diminishing sensibility.*"

"When," says the same philosopher, "under the vertical rays of the never clouded sun, the carbonized turfy covering of the plains falls into dust, the indurated soil cracks asunder as if from the shock of an earthquake. At such times two opposing currents of air, whose conflict produces a rotatry motion, come in contact with the soil, and the plain assumes a strange and singular aspect. Like conical-shaped clouds, the points of which descend to the earth, the sand rises through the rarefied air in the electrically-charged centre of the whirling current, resembling the loud water spout, dreaded by the experienced mariner. The lowering sky sheds a dim, almost straw-coloured light. The horizon draws suddenly nearer, the steppe (plain) seems to contract, and with it the heart of the wanderer. The hot dusty particles which fill the air increase its suffocating heat; and the east wind blowing over the long-heated soil brings with it no refreshment, but rather a still more burning glow." . . . . "As in the icy north the animals become torpid with cold, so here, under the influence of the parching drought, the crocodile and the boa become motionless and fall asleep, deeply buried in the dry mud. Everywhere the death-threatening drought prevails, and yet by the play of the refracted rays of light, producing the phenomenon of the mirage, the thirsty traveller is pursued by the illusive image of a cool, rippling, watery mirror." Of the distress which the herds of horses and cattle suffer at this season, the writer gives a fearful picture, which we must here omit.

"At length," he adds, "after the long drought the welcome season of the rains arrives, and then how suddenly is the scene changed! The deep blue of the hitherto perpetually cloudless sky becomes lighter; at night the dark space in the constellation of the southern cross is hardily distinguishable, and the soft phosphorescent light of the Magellanic clouds fades away. A single cloud appears in the south, like a distant mountain rising perpendicularly from the horizon. Gradually the increasing vapours spread like mist over the sky, and now the distant thunder ushers in the life-restoring rain." The suffocating heat has passed away as if by magic; the vegetation of the plains springs into luxuriance; the beasts of prey roam abroad; the herds rejoice in water and pasturage; and the creatures which slept in torpidity awake and bestir themselves. It is now that the alligator and huge boa burst from their temporary graves. "Sometimes," so the aborigines relate, "on the margin of the swamps the moistened clay is seen to blister, and rise slowly in a kind of mound; then, with a violent noise, like the outbreak of a small volcano, the heaped up earth is cast high into the air. The beholder acquainted with the meaning of this spectacle flies, for he knows there will issue forth a gigantic water snake, or a scaly crocodile, awakened from a torpid state by the first fall of rain."

Thus, then, in the hotter regions, during the season of drought, life appears to stagnate as it does in the winter of our northern latitudes; but in each case one great object is aimed at, according to the wisdom of Providence, namely, the preservation of life, although under a semblance of death.

Wonderful and striking, if we consider it, is this preservative law. In our climate so few are the hybernating quadrupeds or reptiles, that persons in general are seldom led to notice the change which spring produces, when the hedgehog, and fieldmouse, and dormouse, issue forth, when the snake leaves its retreat, when the lizard appears on the hedgerow banks in all its liveliness, and the frog, emerging from the mud, throngs every pool and drainage course,

But in the hotter regions, where during the season of intense heat and drought, when all nature seems oppressed, so great a multitude of animals retire and sleep, and then suddenly burst forth, roused by the first showers, grateful to man and beast, the contrast forces itself on the attention. It is one of the natural phenomena with which the wildest aborigines are intimately conversant.

For "The Friend."

To the Philadelphia Association of Friends for the Instruction of Poor Children.

The usual period having arrived, the Managers present to the Association their Annual Report of the condition of the Institution, under their care.

The schools have been continued without interruption, during the entire year, to the satisfaction of the managers, and, we trust, to the benefit of the pupils. We also believe the concern of the Association has met with such encouragement, as to call forth its continued efforts on behalf of these indigent children.

The schools have been regularly visited semi-monthly by committees; and the deportment and improvement of the children in their studies, have been generally satisfactory, and in many instances quite encouraging; affording a reasonable that the instruction and discipline inculcated not be lost upon them, but may be to their a tage through life.

The teachers appear to have a due sense o importance of the undertaking committed to t and their efforts have been satisfactory. former principal of the Girls' school, resigne situation early in the season, having filled place for a number of years, very acceptab the managers.

In the Infant department, the attendance usually been large, which has been gratifyi the managers to observe, evincing a conti disposition on the part of parents to avail t selves of the opportunity of placing their-chil under our care, and in a situation to gain ins tion.

In the Girls' school, the usual system of ed tion has been continued, and the same bran taught, including sewing, and the progress of pupils has been generally commendable. school has not been so well attended as we c wish; one cause for this, is the disposition the part of parents and caretakers to hire out t children, as soon as they are old enough for purpose, thus sacrificing their interests in an e cational point of view, for the sake of a trif pittance for their labour, without a just appre tion of the loss they are thus sustaining. Irre larity in attendance also continues to be a g drawback from the usefulness of these schools

We desire the friends of this Institution o sionally to visit it, and judge of its usefuln Such visits would afford encouragement not o to the managers, but also to the teachers pupils.

Shoes, to the amount of $9.70, and various g ments made up in the school, were distributed the more destitute, during the past winter.

The whole number, now on the register in t Infant school, is 1522; class list, 84; aver attendance during the year, 70.

In the Girls' department, register number, 9 class list, 65; average attendance, 35.

Orders have been drawn on the Treasurer d ing the year, for $1229.07.

Signed on behalf of the Board of Managers,

CHARLES J. ALLEN, Clerk.

Philad., Twelfth mo. 31st, 1855.

OFFICERS OF THE ASSOCIATION.

Clerk.—Edward Ritchie.

Treasurer.—Richard Richardson.

Managers.—Joel Cadbury, Israel H. Johns Thomas Lippincott, Richard Richardson, Ma Balderston, James Kite, Charles J. Allen, Be H. Pitfield, Joseph S. Elkinton, Edward Sha less, Jabez Jenkins, Jr., and Caleb Wood.

An Accomplished Blind Man.—The Jour des Chartres gives an account of a water-mill the hamlet of Olsieme, near Chartres, built tirely by a blind man, without either assistance advice from any one. The masonary, carpente work, roofing, stairs, paddle-wheel, cogs, in a wo all the machinery pertaining to the mill, has be made, put up, and set in motion by him alo He has also, the above journal asserts, made l own furniture. When the water is low and t mill does not work, our blind miller becomes joiner, and also a turner, on a lathe of his o invention, and so he makes all manner of uteusi and pretty toy windmills for the juveniles. I lives quite alone, sweeps his own room, and coo his own dinner; his mother, who has fifteen ch dren to care for, lives a mile off, and does n trouble her head about "her blind boy," for "

his bread now," she says, "and does not her." In 1852 this blind miller was ed with a medal by the agricultural society arrondissement, for a machine serving the e purpose of winnowing corn and separating est grains from the common sort.

But we must be cautious that sufferings are not occasionally our own fault. we should regulate our lips, and redeem the as St. Paul saith, fleeing from the world, its amusements, useless correspondencies, and ofitable conversations, which seem only to ate our minds, and indulge our self love. ese means we shall find time for the service d. All that is spent otherwise is lost."

natever thy character says of thyself will be ed, but what thou sayest, in commendation instead of being believed, will but render ridiculous.

THE FRIEND.

FIRST MONTH 19, 1856.

the present number we end our publication "Appeal for the Ancient Doctrines," issued iladelphia Yearly Meeting in 1847. From Friends in various parts of the country we received assurances of their satisfaction with troduction into our columns at the present as being particularly opportune, and their that its renewed circulation has been pro- ve of good effects.

uch has been done to disseminate extensively, ions, that no sufficient cause existed, calling ch a testimony against the doctrines pointed s erroneous, nor for such a contrast being n between sentiments contained in the pub- l works of J. J. Gurney and E. Ash, and inculcated by the early Friends, and ever to be part of the faith of the Society.

o positions have been assumed by those who ieed this opinion, and who have been opposed e Society publicly disowning any portion of ritings of the first named author, in relation e course pursued towards them by Ohio and delphia Yearly Meetings, and by those ds in other Yearly Meetings who have felt d to express and maintain a decided testimony st them. One is, that had no public notice taken of those works, and what errors they contain not have been brought into view, the s themselves would have made but little im- ion and soon passed out of notice, the errors been overlooked or forgotten, and the Society escaped the contention between those who ved the purity of its faith to be endangered, those who did not so believe, together with s who were prepared to have that faith ged. The other is, that injustice is done to author by extracting from his works those which appear to contain sentiments incompatible with the acknowledged faith of the Society, because the greater part of his writings support sound views of christian doctrine; and that ignorance and prejudice gave rise to and directed the action of those who have borne testimony against them. This latter position is thus set forth by the author of the Life of J. J. Gurney: "By an unhappily mistaken process of reasoning and criticism upon detached passages of his works, such as if applied to the writings of the early Friends, to those of the first reformers, or even to the Holy Scriptures themselves, would be found productive of consequences which the lover of truth could not fail to deplore, an attempt has been made with a zeal worthy of a better cause, to prove that he was opposed to those great principles of Spiritual Christianity which have ever distinguished the Society of Friends—principles which had been so long dear to him, and for which he had sacrificed so much." * * * "To the candid and unprejudiced; to those who read them [J. J. Gurney's works] in the spirit in which they were written, and with that simplicity of purpose in which alone the truth can be perceived and apprehended, they will themselves furnish a sufficient answer to the charge brought against them. That amid so much that is valuable, passages may be found which are open to misconception, and which, especially when isolated and detached from the context, may be perhaps even justly liable to some exception, is by no means improbable."

Of the first position it may be observed that no little effort had long been made to circulate widely among Friends in various places, the works containing the passages objected to, accompanied with recommendations of their worth and eulogiums of their author, and however ephemeral those works themselves might prove; yet the unsound views contained in them had long been well known, having had greater prominence given to them by being more systematically promulgated and enforced, not only by E. Ash, but also by some who went off in the Beaconite separation; who declared that their distinctive views were primarily derived from J. J. Gurney and some of his fellow members in England; and although many withdrew at the time of that separation, it was well known that many others holding similar views remained in the Society. So that although E. Ash continued to promulgate his undisguised attacks on primitive Quakerism and primitive Quakers, no effort was made by the meetings to which he was amenable to clear the truth and the Society of the reproach thus cast upon them.

The peculiar character of the times, and the low state of the Society—a time of almost unexampled outward prosperity; and a state of ease, of wealth, and of luxury—had begotten among very many, lukewarmness towards primitive purity and simplicity, and a corresponding predilection for a religion of theory and sentiment, which could be readily maintained without so much of the offence of the Cross as was inseparably connected with pure Quakerism; all these causes had long been and still were at work, to prepare the minds of many in membership, to lay hold with avidity of those views interspersed throughout the works of one who occupied a conspicuous position in the Society, which they could easily see favoured a modification of its original, and as they thought too rigid faith; and thus gave activity and force to them as a leaven, which if permitted to operate unchecked, must finally work out and expel the distinctive characteristics of Quakerism.

In this state of things it was no-wise extraordinary that a large number of those in different sections of the Society who were well acquainted with its religious principles, had long been devoted to its welfare, and employed by the Head of the Church in his service, should be brought under deep concern on account of the evils already produced, and those which were threatened, and find it laid on them as a religious duty to point out the dangerous errors contained in works emanating from such a source and so widely spread, to warn against the reception of those errors, and appeal to their fellow professors for the support of the ancient faith of the Society. If, as R. Barclay says, it is one of the characteristics of a true Church to bear a joint testimony not only for the truth, but also against error, thus becoming as one family and household, how could it be otherwise, if any part of the Society remained faithful to its trust, but that its testimony should be borne against sentiments, coming from what source they might, which, urged to their legitimate conclusions, had already induced many to secede from Friends, which, whether adopted or not, were still spreading distrust and disunity throughout the Society, threatening to break in again on the integrity of its religious compact?

Whatever commotion and trouble might follow the issuing of such a testimony, were not attributable to that portion of the Society which bore it, but to the unsound doctrines disseminated, and to those who were disposed to reject and denounce the testimony against them. One portion of the Society having permitted poison to be spread abroad, to the great danger of those who either ignorantly or wilfully tampered with it, it is certainly most unjust to attribute the sad consequences resulting from it, to another portion of the Society which was solely concerned to point it out, to warn against partaking of it, and to furnish an antidote for it.

Why should any object to the church thus exercising its legitimate authority in defence of its faith by exposing and condemning errors that threatened not only its purity, but its existence? unless indeed they were favourably disposed to those errors, or altogether indifferent to the best interests of the Society, or too fearful of the suffering which arises from earnestly contending for the faith once delivered to the Saints. If we sincerely believe Quakerism, as set forth by Fox, Barclay, Penn, and Penington, to be the religion of the New Testament without addition or adulteration, there can be nothing of more vital importance to us, as members of the Society, next to the salvation of our souls, than that that faith should be preserved unaltered and unobscured, and that the Church shall not overlook or shrink from the duty incumbent on it to build up the members therein.

On the other position, as set forth by the biographer of J. J. Gurney, we may have some remarks to offer, which are deferred to another number.

SUMMARY OF EVENTS.

EUROPE.—The Atlantic, with Liverpool news to Twelfth mo. 31st, arrived at N. York on the 13th inst. She left Liverpool on the 30th, but, owing to bad weather, was obliged to put into Cork, whence she sailed on the 2d inst. There is nothing important from the Crimea. Some of the French outposts had been drawn in in order to prevent their being attacked by the Russians. The roads were so bad that the conveyance of materials for the huts, had been suspended, although some thousands of the allied troops were still under canvass. All the British cavalry had arrived from the Crimea, at Scutari and Ismed. Storms in the Black Sea had caused considerable damage to shipping. It is stated that peace propositions of some kind had been made to Russia by the Austrian Cabinet, and that the terms of peace offered had previously received the approval of France and England. Their acceptance by Russia was considered doubtful. It is reported that a project is on foot for

calling together a European Congress "to settle not only the present Eastern difficulty, but all the complications in European relations that have arisen since the Congress of Vienna."

ENGLAND.—Consols are quoted at 88½. The Liverpool cotton market was dull, and sales light. The total stock of American in port was 191,000 bales; at same time last year, 246,000 bales. The market for breadstuffs was dull at a decline of 3*d.* per bushel in wheat, and 1*s.* per bbl. in flour. The late heavy arrivals had more than supplied the demaud. Western canal flour, 41*s.* Philadelphia and Baltimore, 42*s.* 6*d.*

NICARAGUA.—If the latest reports may be believed, the country was improving under the Walker government. Five hundred expeditionists under Capt. Zerman had landed at Cape St. Lucas. Walker had been recently joined by 200 men. It is said that the governments of San Salvador and Honduras have sent letters of recognition to the new government, and the Minister from Honduras is reported to be on his way to Granada. Col. Kinney was still at San Juan; a number of his men had gone over to Walker.

UNITED STATES.—*The Products of Labour.*—The Secretary of the Treasury in his Annual Report, says that the agricultural and manufacturing productions of the United States, according to the census of 1850, amounted in value to upwards of two thousand millions of dollars; he estimates the increase during the last five years to be 50 per cent., making their annual value at this time three thousand millions of dollars, nearly equally divided between agriculture and manufactures.

The Currency.—The Secretary estimates the gold and silver in circulation in 1855, at more than $250,000,000, and the bank notes at $187,000,000, making a total circulation of $437,000,000.

The Indians.—The Secretary of the Interior holds as trustee for a number of the Indian tribes, stocks to the value of $2,098,879. The Secretary says that the Indians, with the exception of a few tribes, have been well disposed, and anxious to cultivate and preserve friendly relations with the whites. He recommends a kind and liberal policy towards them, and thinks an increase of the "Civilization Fund" desirable. "Indian disturbances," he says, "are often traceable to the indiscretions and aggressions of white men. We have reliable reports of such cases, and of the most murderous and unprovoked attacks upon them when entirely defenceless. We are rapidly closing upon the hunter tribes from both the Atlantic and Pacific oceans, and soon all the buffalo and other game will have disappeared, and almost every foot of arable land be occupied by the white man."

Ocean Postage.—The annual compensation of the Collins line of steamers is $858,000. The revenue from ocean postage last year was $374,326,—a losing business for the department.

Congress.—No organization of the House of Representatives had been effected on the 14th inst., and the spirit of factious strife by which the legislative branch of the government is paralysed, still predominated in the House.

New York.—The House of Representatives of this State had been unable to elect a Speaker during the first two weeks of the session. The members seem disposed to imitate the bad example set them at Washington.

Pennsylvania.—On the 14th inst., William Bigler, late Governor of the State, was elected to the U. S. Senate for six years, from the 4th of Third month last.

Railroad Disasters.—On the 9th inst., a collision occurred on the Hudson Railroad near Poughkeepsie, by which three persons were killed, and a number crushed and wounded. On the 10th, a freight train on the Terre Haute and Alton Railroad ran off the track, and five persons were killed.

Severe Weather.—From the 4th to the 6th and 7th inst., a heavy fall of snow occurred in most, if not all the Atlantic States. The storm commenced at the Gulf of Mexico, and extended northward and eastward. At Mobile, eight inches of snow fell; further north it was much deeper; in some localities a fall of two feet is reported. Many of the railroads were so obstructed that a temporary suspension of travel was unavoidable. The snow storm was followed by intense cold. Some of the thermometrical indications were as follows:—At Philadelphia, on the morning of the 9th inst., from 6° to 9° below zero; at West-town B. School, 19° below; Baltimore, from 10° to 14° below; Cincinnati, 10° below; Marietta, 11° below; Springfield, Ohio, 20° below. On the 10th inst., at Chicago, 19° below; Cleveland, Ohio, 7° below; Frankfort, Ky., 16° below. During the storm, two vessels, the schooner Pacific and the barque Duke of Braganza, were wrecked on Long Beach, N. J. The captain and four of the crew of the schooner perished, and probably all on board the barque, as no trace of them was seen. On board another vessel, four pilots were frozen to death. Other disasters to shipping on the coast are reported.

Philadelphia.—Mortality last week, 225; of small-pox, 20; scarlet fever, 16.

New Jersey.—The State revenue the last year was $221,263; the disbursements, $221,140. The Governor in his message recommends the suppression of banknotes of a less denomination than five dollars.

New York Railroads.—The earnings of the railroads in this State, during the year ending Ninth month 30th last, amount to $20,843,000, and their expenses, during the same period, to $11,310,000. The entire cost of construction is stated at $125,252,669.

California.—Two recent arrivals at New York, brought nearly two millions in gold. The dates from San Francisco are to 20th ult. The rains having set in, there was increased activity in the mining districts. The discovery of gold in large quantity in Table mountain, had produced much excitement among the miners. The news from Salt Lake reports a battle with the Indians at Elk Hollow, in which 120 were killed. In Oregon and Washington Territories, the Indian war was waged with much ferocity and serious loss on both sides.

Miscellaneous.—Whaling Statistics.—There were engaged in the United States whale fishery during the last year, 146 ships and barks, 6 brigs and 20 schooners; and the returns taken by them, 6,285 barrels sperm oil, and 176,186 of whale. The receipts in 1854 were 69,418 barrels of sperm, and 321,593 of whale. New Bedford employed during the past year, 81 ships and barks; Fairhaven 10; and New London and Nantucket each 9.

Telegraphic Progress.—It is but eleven years since the first telegraph line, of 40 miles in length, of Professor Morse, was built, and now there are no less than 38,000 miles of telegraph wire on our continent. In Europe lines of telegraph have been constructed to an extent exceeding those in America. The electric wire extends under the sea of the English Channel, the German Ocean and Mediterranean.

The Lake Trade.—The total receipts of grain at Buffalo, N. Y., by lake, last year, were 19,788,473 bushels, against 18,553,465 in 1854, and 11,078,741 in 1853. The total value of property exported from Buffalo on the Erie canal during the past year was $29,258,437, the tolls amounting to $755,574. The value of property left at Buffalo, on the canal, was $87,856,037.

The Breadstuffs Flour Trade.—The sales of the last year embraced about 1,000,000 barrels. The domestic consumption of flour in Philadelphia, is estimated at 600,000 barrels per annum. The sales of wheat reached 1,400,000 bushels, and of corn, nearly 1,700,000 bushels. There are 11 flour and grain mills in the city, capable of grinding 1509 barrels a day.

The Valley of the Amazon.—The Peruvian Government has made a contract with Damion Schultz, a German citizen, of Peru, for the colonization of the region of the Amazon and its branches, in the neighbourhood of Chanchamayo and Cuz, at the foot of the Andes, with ten thousand able-bodied colonists of the Roman Catholic faith. A grant of land is to be made for each colonist, and the Government is to render some pecuniary aid in carrying out the scheme.

London.—The population, according to recent statistics, amounts to 2,500,000. The census states that it contains 307,722 inhabited, and 16,389 uninhabited houses.

The New Line of Atlantic Steamers.—The Montreal Ocean Steamship Company have given notice that five first class screw steamers will form the government mail line between Montreal and Liverpool. The first of the line is to leave Liverpool on the 23d of Fourth month; the others to follow in regular succession.

The California Mint.—During eleven months of last year, the gold coinage amounted to $20,498,048; the deposits of gold were $21,374,871.

The Western Pork Trade.—The supply of pork is found to be larger than was anticipated. The quantity from Kentucky this year, will far exceed the last. The number of hogs killed at Cincinnati, the present season, amounted on the 5th inst. to 257,376. On that day, hogs were held at $5.15 a 5.22, without sales.

Large Hogs.—A correspondent of the Doylestown (Pa.) Democrat says that Alfred Vandegrift, of Bensalem, in that county, slaughtered on the 31st ult. five hogs, weighing four thousand and ninety-three pounds.

British Railroads.—During the first half of the year 1855, 113 persons were killed, and 158 injured on the various railroads, in the kingdom.

Trade of St. Louis.—The number of steamboats that traded at the port of St. Louis, during the past year, was 328, besides 68 canal boats and barges. The receipts of lead for the year were 315,677 pigs; the quantity of flour manufactured by the City Mills, 6 bbls., or 100,195 barrels more than the previou The receipts of corn were 2,944,590 bushels.

RECEIPTS.

Received from Chas. B. Owen, N. Y., $2, vol. 29; John Hoyle and B. Hoyle, jr., O., $2 each, vol. 29 Benj. Hazard, R. I., $2, vol. 29; from P. P. Du N. J., $2, vol. 29; from Jas. Austin, agt., Nantt., G. Coffin, $4, vols. 28 and 29, for Peleg Mitchel John Monroe, $2 each, vol. 29.

CORRECTION.

The word distant, in the fourth line, from the the first column, eighth page of our last number, s be *distinct.*

SOUP HOUSE.

The Society for supplying the poor of the city soup, have opened their house, No. 16 Green's and are daily delivering soup, (First-days exce between the hours of 11 and 1 o'clock, to such ne tous poor as produce a recommendation from respectable person.

As the Society is dependent for means to suppo useful charity, on the annual donations of the be lent, they respectfully solicit aid from such as m disposed to contribute. Donations in money m sent to the Treasurer, Jeremiah Hacker, No. 144 Fourth street, or to Thomas Evans, No. 180 Arch

Beef, flour, beans, rice or other vegetables w gratefully received at the soup house.

WESTERN SOUP HOUSE.

The above was opened on the 3d instant, an managers will be grateful for contributions in their funds, which may be sent to

WILLIAM BIDDLE, cor. Arch and Eleventh
SAMUEL L. BAILY, No. 252 Chestnut st.

Friends' Boarding-School for Indian Children, Tunessassah.

Two women Friends are wanted at this Institut assist in the family.

Also, a man Friend to aid in carrying out th cern for the improvement of the Indians.

DIED, on the morning of the 29th of Tenth mont at her residence near Moorestown, N. J., EDITH L COTT, in the 34th year of her age. This dear Frie long endured, with exemplary patience, the suffe protracted disease. For some months before her she was sensible that her end was near, and exp her willingness to leave the world, saying she ha tie to bind her to earth. Gratitude for the assur acceptance mercifully granted her, was often the ing of her spirit, while she was frequently enga petitioning for an evidence of the continued pres her Saviour, unto her end. On the morning befo close, she remarked, "I am yet here, but am don time, its cares and anxieties, and all that embitter adding, "My faith is strong in the mercies of m Redeemer, who has blotted out my transgression given me the peace I now feel, which I would n change for a thousand lives." The circle of frien relatives to whom she was endeared, while mo her loss, feel the consoling assurance that she is a partaker of that unalloyed happiness of which sh a blessed foretaste. "These are they which ca of great tribulation, and have washed their robe made them white in the blood of the Lamb. Th are they before the throne of God, and serve h and night in his temple."

——, on the evening of the 30th ult., in the 67t of his age, WILLIAM THOMAS; a much esteemed m of the Monthly Meeting of Friends of Philadelp the Northern District.

From "The Leisure Hour"

Boyhood Underground.

appers, fillers, slack-boys, pitchers, pushers,
ers, and other technicalities, not remarkable
ither intelligibleness or euphony, occur in the
enclature of our coal districts, to denote the
iiles in the pits, according to their various
s of occupation and labour. The "trapper,"
r-door boy, has the charge of a door placed in
d along which horses, men, and boys have to
but through which it is essential to the ven-
on of the mine to prevent the currrent of air
the downcast shaft from sweeping, in order
this current may be forced round the other
and workings of the pit. The duty of the
er is to open this door as occasion may re-
, and then to shut it again as quickly as
ble; and on his keeping the door constantly
excepting at the moment when persons are
ng through it, the safety of the mine and the
of the persons employed in it entirely de-
. The "fillers" crawl after the adult colliers,
ewers, into the narrow spaces where they are
nering at the coal above or before them, and
h in very thin seams only admit of work be-
lone in a kneeling position, or sitting, bend-
louble, lying on one side, or on the back. The
r pieces are pushed out by these attendants,
carried away to fill the corves, skips, or car-
s in which they are removed. The "slack-
" likewise crawl in to rake the small coal and
, termed slack, into baskets, and dispose of it
where. The "pitchers" are employed in ba-
ng and adjusting the coals in the skips, so as
iild up a load, and in arranging the requisite
e about them. In the mines in which the
a of coal are too narrow and the roads too low
horses to go up to the workings, "pushers,"
rriers," or "thrusters"—names denominating
same class—are engaged in pushing the car-
s from the workings to the horseways, or the
e distance to the foot of the shaft. The voca-
of the "drivers" requires no explanation;
it is by far the best kind of occupation in pits,
g them exercise with little labour, and some
ee of variety. It may also be remarked in
ng, that their charge, horses, ponies, or asses,
re remarkably underground, get fat, sleek, and
conditioned, however deleterious the sites are
en and boys. The domesticated cat likewise
sionally finds a comfortable home in these sub-
anean regions, and obtains plenty of game, rats
mice abounding in many of the pits.

revious to the passing of Lord Ashley's act,
ch 1, 1843, which prohibited the employment of any one in mines under ten years old, children of very tender age were taken down by covetous or needy parents, and engaged by unscrupulous managers. Inquirers met with the greatest difficulty in ascertaining the real ages of the juvenile operatives. Seven or eight years was not uncommon in various districts; nor was six very rare; and the remarkable instance of a child of four was encountered. This was in the Hill's-lane pit, belonging to the Madeley-wood company, Shropshire. "I say, Jonas," said the ground-bailiff, "there are very few children working in this mine; I think we have none under ten or eleven." The collier immediately replied, "Sir, my boy is only a little more than four." "Well," rejoined the manager, "I suppose that you take good care of him; you take him up and down when you go yourself." This abuse of childhood has very properly been rendered penal; and we may think even ten years of age a little too early for life in the pits to commence.

The trappers are always the youngest in a coal pit. Pitiable indeed is their lot from its seclusion, gloom, and extreme monotony. Owing to these circumstances, they are in general very shy, have seldom anything to say for themselves, and a question will often elicit only the stare of vacancy or surprise. Labour there is none, nor exertion further than is requisite to open and shut a door. In a hole scooped out for them at their post, or crouching in a corner upon their heels, the little urchins sit with a string in their hands attached to the door. They pull it open the moment they hear the approach of a corve, letting it fall to, which it does of its own weight, the instant the vehicle has passed. Were it not for this interruption, their lot would be solitary confinement of the worst order. If anything impede the shutting of the door, they remove it, or if unable to do so, run off to the nearest man, to get him to do it for them. If not quick in opening the door in time, a thump or kick will perhaps be bestowed by the irritable passenger, or some horrible hobgoblin story be mentioned to frighten the poor child in the darkness. From the nature of their office, the doorkeepers are compelled to be in the pit the whole of the working-time. When a colliery is in full work, three sets of men commonly divide the twenty-four hours between them, each set working eight hours; but there will be only two sets of boys to three of the adults, so that the former have to be immured for twelve hours together, often commencing from a very early period in the morning, and ending late in the afternoon. We will give a case in point, that of Thomas Rokeby, a trapper in Flatworth pit, in the northern coal district. His mother stated, that the "boy was at school at three years old, and his father wished to make him a better scholar before he went down. Always puts him to bed early, because he must get up every working morning at three o'clock; and he often rubs his eyes when he is woke, and says he has only just been to sleep. He gets up at three A. M. and goes down the pit at four o'clock. He gets his dinner directly he goes home, about half-past four or a quarter to five P. M., and then he washes himself, and goes to bed between six and seven o'clock; so that he will never be up more than two hours from the pit for eating, washing, and playing." Little is it imagined by the mothers of England in suburban villas, with their children grouped around a bright fireside, that other children have to rise while theirs are slumbering, and go down to blackness of darkness, while theirs roam the fields in the sunshine, in order to win the coal which enlivens the domestic hearth!

The long wearisome hours of working time are often passed with a damp floor to sit or stand upon, and the trappers are necessarily exposed to drafts. When the doors are closed, the strong air-current may be heard sighing, hissing, whistling, or screaming, according to its strength, in the endeavour to proceed onwards through the chinks and crevices. The "doors are a singing," is the pitman's phrase for this wild music. It is not always listened to with agreeable feelings, for when unusually loud there is reason to apprehend some derangement in the ventilation. But the great grievance of the trapper's lot is the solitude to which he is consigned, only interrupted by the brief passage of the coal-wagons, and the darkness in which he is immured. Occasionally the little fellows may be so posted as to be near the shaft; to which they can sometimes run, and enliven themselves with a view of the iron buckets going up or coming down, snatching a bird's-eye peep at the daylight aloft. In some collieries also, candles are supplied by indulgent managers, while bits of tallow to form a light may be given by some good-natured collier passing by as a treat. But darkness and seclusion—above all things most intolerable and ungenial to young children—constitute the rule. "On one occasion," observes a visitor, "as I was passing a little trapper, he begged me for a little grease from my candle. I found that the poor child had scooped out a hole in a great stone, and having obtained a wick, had manufactured a rude sort of lamp; and that he kept it going as well as he could by begging contributions of melted tallow from the candles of any Samaritan passers-by." It is painful to contemplate this dull, dungeon-like life. Well might the stanzas of the "Trapper's Petition" be indited:

"Father! must I go down with you
Into that dark and dismal hole,
And leave the sky above so blue,
Buried amidst the blackest coal?

Father! I want to go to play,
I've had no play since Monday last;
O! let me have one hour to-day,
And then I'll work and do a vast!*

O! let me play a pretty game
With Tom and Bill upon the heap,
And I shall do my work the same—
For then I shall not fall asleep.

Just let me get those pretty flowers
Down in the field beside the stream;
Then I shall while away the hours
As though I lay in pleasant dream.

Well, father! if I must go down,
Just hold me tight upon your knee;
But get me work in yon big town,
And let me life and daylight see!"

* A provincialism for doing a great deal.

Can none of the employers of these lads do something to ameliorate their condition?

Though apparently a probable event, there is little danger of the urchins losing themselves in the pits, for they are commonly taken down and brought up again by relatives or friends. Their post in the interval is likewise completely stationary; and they are effectually prevented wandering from it by the certainty of rough punishment, not to mention the fear of hobgoblins, whose fame is kept alive for the express purpose of restraint. Yet the case has occurred, and very recently, in 1852, in one of the Welsh pits. A boy, William Withers, went down on a Friday morning, with his father as usual. Having forgot something, he returned to fetch it, and on proceeding alone along the subterranean road, his light went out. He consequently lost his way, wandered into some old workings, and nothing was known of him till the following Monday, when he was fortunately found, but in a very weak state, and taken home. During the whole time he had only his Friday's dinner for his support. He gave the following account of himself:—"After I lost my light, I found that I was lost and in a strange road. I could hear my father at work all day on Friday. I knocked at the side, and made as much noise as I possibly could, but no one answered me. They all went out that night, leaving me there; I cried very much. I thought I saw the stars two or three times, although I was a hundred yards under ground. I saved my dinner as much as I could, only eating a bit at a time, not knowing whether I should ever be found. The pit broke (work) on Saturday morning, so there was no work until Monday morning. The whole time I had been wandering about in the dark, when I heard the hauliers (horse-drivers) and I made my way to them." The boy did not know what day it was when he was rescued; and so long had the dreary time of his imprisonment appeared to him, that he fancied he had been lost a week.

(To be concluded.)

For "The Friend."

"About the First month, 1678, I found some powerful drawings in the love of God, to go down once more into Yorkshire, where I had had much service for the Lord, but had not been there for about six or seven years. So I went down to Hull, and visited the churches about Holderness, Hull, Beverly, Malton and York; in all which places, I saw the glory of the temple of my God shine forth in great splendour, *notwithstanding all the rage of the adversary;* and I had a precious service in every place, and the hearts of many were opened, and the souls of many dear friends were truly refreshed, and the bread of life was plentiful among us to our mutual joy and rejoicing. My soul was greatly comforted to see so many of the *ancients, and honourable men and women abiding in their places,* and growing up in the house of God as fellow helpers in the gospel with us."—S. C.

What has been may be brought to pass again through the mercy and power of the same gracious Lord, notwithstanding the rage and subtilty of the adversary, which he is exerting in various ways to beguile, and to destroy the Lord's people. Let us hold fast our faith and confidence in the unalterable compassion of the Shepherd of Israel, and he will foil the devil in all his stratagems, and open a way for his suffering seed to escape. The horse and his rider will be thrown into the sea, and ancients and honourable servants of the living God, we may trust, will again rejoice in beholding the arising and dominion of the Prince of life and peace, and their souls be satisfied with the wine of his kingdom—"a feast of fat things full of marrow, of wines on the lees well refined." They will be able to adopt the language of the Psalmist, "Thou hast also given me the shield of thy salvation, and thy right hand hath holden me up, and thy *gentleness* hath made me great."

African Kindness.

Notwithstanding the heathenism and uncivilized character of the tribes of Africa, we occasionally hear of their tender-heartedness and kind feelings towards others. Many of our older friends will remember the touching lament of some African females over the celebrated traveller Mungo Park, many years ago, when he came to their village, in the interior of the country, in a state of great destitution, friendless and forlorn—

"The winds roared, and the rain fell,
The poor white man, faint and weary, came and sat under our tree.
He has no mother to bring him milk, no wife to grind his corn.
Let us pity the white man—no mother has he," &c.

In page 174 of our last volume a very touching instance of African sympathy and kindness is recorded. It is shown on the occasion of the severe illness of Mr. Hinderer, our missionary of Ibadan, by a young heathen war-chief, whose heart appeared to have been a good deal attracted towards the missionaries. Indeed, the interest and sympathy of many of the natives on that occasion were truly remarkable: they were continually coming to Mrs. Hinderer, treading with light step, and asking her, in a whisper, "Is father better?" The young warrior, however, by name Olomloyo, came every day, and was well nigh heartbroken. "He told me," says Mrs. Hinderer, "that I must pray much for my husband." The latter was suffering greatly from thirst and exhaustion, and felt a strong desire for some oranges, the season for which was, however, past. There was not one to be had. This was mentioned to Olomloyo, who immediately sent his servants out into the country to see if they could procure any; but in vain. The chief was very sorry. He said, however, that he *must* have some; and he therefore set off himself on horseback, galloping to several farms in search; and at night he returned with no small delight and brought back eleven. He took them immediately to the sick missionary, and waited until he saw him devour one, almost greedily. The young chief was so pleased that tears filled his eyes. Mr. Hinderer tried to thank him for his kindness. Olomloyo, however lifted up his hand, and said, "don't speak! I am too glad."

Who could have expected such sympathy and tenderness, as well as such good breeding, from an unconverted war-chief at heathen Ibadan? Surely there is much reason to hope for success of the Gospel amongst such characters.

Colonization Herald.

For "The Friend."

When John Richardson travelled in this country, he says, "I found it much my work, to be engaged in the *discipline of the church,* which was very low in many places; yet there was a willingness in Friends' minds to be helped in that needful concern. For surely it is a good fence, and a *help to keep the righteous in,* and *hurtful* and *wicked things and doings out,* if the same be rightly handled, and extended as it ought to be, in the *love and wisdom* of God." This highly favoured man saw that the righteous have need of instrumental help to keep them within the safe enclosure of Truth, and the fellowship of the church. Good men are exposed to temptation as well as others, and are benefitted by all the aid their brethren can give. This fence, which has been set up by the Head of the church, cannot be broken down with impunity. It is for the health and welfare of the body, and those who trample it under foot, will lose the divine life, and their ability to support his precious cause. They will be entangled in difficulties, out of which they can never extricate themselves, and be disqualified for administering the discipline on future occasions.

For "The Friend."

On Shooting Stars and Meteorites.

(Concluded from page 148.)

With respect to the identity of shooting stars and solid meteorites, Humboldt seems to have no doubt; and remarks, that this identity, "has been by any means proved hitherto." Were they the same, it is natural to suppose that on the occasion of such an immense shower of shooting stars, as that of Eleventh mo. 1833, some meteoric stones would have been observed to fall, whereas there is not a single instance on record where these showers have been accompanied by the descent of a meteorite. Baron Humboldt, however, regards meteorites as similar in their origin to shooting stars, viz; as small planetary masses or asteroids, revolving in space about the sun, which occasionally intersect the earth's orbit and are drawn to it by its superior gravity. After a careful examination and comparison of the several hypothesis put forward by writers on this subject, the evidence appears to preponderate in favour of the conclusion, that solid meteorites are probably ejected from the volcanoes of the moon, and we shall give an exposition of the arguments and facts, which may be adduced in support of this theory. It was first suggested, in 1660, by an Italian philosopher, Terzago, and afterwards by Olbers in 1795. Laplace advocated it firmly, and it has been subsequently held by Berzelius, Biot, Brandes, Poisson, Quetelet, Arago and Benzenberg.

Berzelius was untiring in his chemical analysis of meteoric stones, and was convinced of the mineral character from these investigations; his remarks, "As it is absurd to suppose that minerals can be formed in the air out of the elements of the air, they cannot be atmospheric products, and the less so, as many of them present cavities which are filled with a mineral of another colour, and probably of a different composition, which were a plain absurdity to consider as being possibly formed in them during the few moments the attraction of the earth would suffer so heavy a body to remain in the atmosphere. They become such elsewhere. They are not cast out from the volcanoes of the earth, for they fall everywhere, not merely, nor oftenest in the near or remote neighbourhood of a volcano. Their external appearance is unlike a terrestrial mineral—unlike anything which volcanoes eject. Their containing unoxidized malleable iron proves that water is not found, and perhaps not air in their former abode. They must therefore come from some other place, which has volcanoes. The one nearest us is the *moon,* and the moon has gigantic volcanoes compared with the earth. The moon has no atmosphere to retard the path of projectiles. Collections of water do not appear to exist upon it. In a word, among the probable sources, the moon is the most probable." He argues from the fact that some meteorites contain no native iron, while the majority do, that there are two lunar volcanoes from whence these bodies are projected, and his solution of the cause of their heat an explosion is, that the former is the result of the extreme condensation of the air by the falling body, and being thus heated, certain gases a

ed in its internal cavities which give rise to
xplosion.
of. J. Lawrence Smith, in a late number of
American Journal of Science and Arts, has
shed an Essay on Meteorites, in which he
cates the selenic or lunar theory with great
acy of reasoning of which the following is a
ensed capitulation :—
rst, That all meteoric masses have a commu-
of origin.
is inference is deduced from their chemical
osition and external form. They are of
variety of irregular shape, having the ap-
nce of being forcibly detached or broken from
ger mass.
w, were they cosmical in their origin, that is
ed by nature in individual and distinct masses,
rovided with an orbital motion in space, as
arth and planets, they must, in conformity
the laws of dynamic force, have assumed a
ical or spheroidal form; or supposing they
suddenly formed in the elevated regions of
tmosphere, they must necessarily have been
oft and plastic condition when first so agglo-
ed, and would, like shot falling from a tower,
a globular shape in their descent.
e existence of metallic iron in these bodies in
noxydized state, is conclusive evidence that
en as a gaseous element, or combined in wa-
e not found where meteorites are generated.
ough all meteorites are not composed of pre-
the same elements combined in equal pro-
ons, yet there are some constituents which
common to all of them, and their general
y resemblance is so marked as to be unmis-
ble to the chemist. A mineral which has
termed *Schreibersite*, is universally present
em, and is wholly unknown in any terrestrial
ance.
condly, That they have all been subjected to
re or less prolonged igneous action, corre-
ling to that of terrestrial volcanoes. This is
d by their crystalline structure, in which the
uret and phosphuret of the metals constitut-
he mass, are completely separated in the form
odules, in a manner which could only have
accomplished by the continuous agency of
for a long period. If therefore these bodies
been forcibly driven off from the same large
distinct from the earth, where neither water
ir existed to oxydize their peculiarly suscep-
elements; if it is a pre-requisite of their
nt organic frame that they should have been
ubjects of prolonged igneous influence, such
niversally believed to have upheaved the lofty
rs of the moon, then the ascription of their
n to that planet is certainly the most plausi-
heory to which we can refer for the solution
is singular pLenomenon.
is urged by some philosophers in objection to
hypothesis, that the force necessarily exerted
e lunar volcanoes to discharge bodies beyond
phere of the moon's attraction, must be vastly
er than anything known in reference to those
e earth.
r. Peters, who observed and accurately mea-
l the velocity of the stones discharged from
rater of Ætna, gives 1250 feet per second as
naximum. Whereas Laplace computed that
ntial velocity required to carry a stone from
noon to the earth, would be 7862 feet per
nd. This objection, however, is of no weight,
ere is no cause for circumscribing the projectile
e of the lunar volcanoes within the limits of
e on the earth. It may be, and probably is,
easurably greater as indicated by the immense
ht of some of the lunar mountains.
n the words of Prof. Smith, "To sum up the theory of the lunar origin of the meteorites, it may be stated that the moon is the only large body in space of which we have any knowledge, possessing the requisite conditions demanded by the physical and chemical properties of meteorites; and that they have been thrown off from that body by volcanic action, (doubtless long since extinct,) and encountering no gaseous medium of resistance, reached such a distance as that the moon exercised no longer a preponderating attraction; the detached fragment possessing an orbital motion and an orbital velocity which it had in common with all parts of the moon, but now more or less modified by the projectile force and new condition of attraction in which it was placed with reference to the earth, acquired an independent orbit more or less eliptical. This orbit, necessarily subject to great disturbing influences, may sooner or later cross our atmosphere, and be intercepted by the body of the globe."

The study of shooting stars and meteorites has justly claimed greater attention from modern philosophers than was formerly accorded to this subject; and in proportion as the field of observation, and the number of observers has been extended, the importance of this branch of celestial physics has been appreciated, and proved itself an auxiliary, in sustaining and illustrating the universality of those laws, which govern the operations of nature from the smallest stone to the vast orb of the sun itself. Not the least interesting of the results of this increased investigation, is the well attested fact, that the principles of Dalton's atomic theory of chemical combination and affinity, are equally exemplified by the analysis of meteorites as by that of terrestrial objects; thus affording another link to connect our globe with other cosmical bodies. It has been considered one of the triumphs of modern science to show by the aid of powerful telescopes, that the binary stars, which are so remote from our system as to be invisible to the unassisted sight, revolve about each other in obedience to the same mysterious law of gravity which governs this portion of the universe; but is it not an equally important fact with regard to the proof of unity of design in the Divine Author of nature, that the proportions in which the ultimate particles of matter combine to form organic substances in the moon, are the same as govern those of a body of 240,000 miles from it? Meteoric stones possess an unusual interest when regarded as the only tangible representatives we have of the materials of which other heavenly bodies are composed. As has been stated, when submitted to chemical analysis, they resolve into the same simple substances with which we are familiar in terrestrial objects, and to those who regard it as inconsistent with the Divine economy, that so many millions of spheres should have been created without intelligent beings to people them, this consideration may afford a stepping stone to advance the doctrine of a plurality of worlds, on the supposition that the analogy extends to animated existence.

Selected.

Benevolence.

"In faith and hope the world will disagree,
But all mankind's concern is Charity."

Real benevolence of feeling will always prompt to benevolence in action, and the person who professes an anxiety for the eternal felicity of men may be doubted if he does not strive, as far as his power extends to promote their earthly happiness. No one virtue was so often inculcated and insisted on by our Saviour, as that of almsgiving, and to none other was promised such sure and rich reward. It is just as much the duty of the rich Christian to give alms to the poor as to pray to his God. It is not at the option of such an one to say he will do as he pleases with his own. The earth is the Lord's, and he has commanded those to whom he commits its stewardship to distribute liberally, and he who does not obey, has little reason to believe himself animated by the spirit of that religion, which is "pure and undefiled before God."

For "The Friend."

Will the Editor of the Friend give the following testimony a place in its columns? James N. Richardson was a worthy elder, held in high esteem among Friends in Ireland; where he resided.

A Subscriber.

The following paper was written by James N. Richardson during his last illness, and was given, three days before his close, to two Friends in the station of Ministers, to be made use of in whatever way they thought proper:—he died in the Fifth month, 1847.

Being confined with cold for nearly three weeks, and at the beginning having much time in my lonely hours for contemplation, my mind very frequently turned toward our beloved religious Society, and the present afflicted state of it wherever located.

I have endeavoured for right direction whether to do or suffer, and I think, I have arrived at the conclusion that at the present there is little room to move for those who love, and most surely believe in the ancient doctrines and testimonies committed to our worthy elders, and promulgated by them to the world fearlessly, through deep sufferings, grievous scourgings and buffetings, noisome prisons and filthy dungeons, even to the loss of life, which they did not count dear in comparison of being found faithful to their holy leader, our dear Saviour, the Lord Jesus Christ: — and handed down to us a Society to uphold and maintain undiminished and without compromise.

My mind seems to settle down in the belief that the compact is so strong, and the influence so great, of the chief promoters of these unquakerly, Episcopalian doctrines and views, that the humble-minded, faithful believer in the true Christian views of our worthy predecessors, must be willing to suffer all the appointed baptisms.

There seems arayed so much talent; so much wealth, so much worldly influence, combined with holding high stations in the Church, that things are likely for a time to be carried in a wrong course: these new views are agreeable to the people who like an easy worldly religion:—patient, waiting exercise is irksome;— does not suit the itching ears; so instead of this right qualification, waiting to be baptised into a sense and state of meetings, and concerned to feel a renewal of Divine power, the people are fed with a mere recital of the truths of the Gospel, and given to rest in an assent or belief in the ever blessed sacrifice, and what our dear Lord has done for mankind without us: by this belief they are taught to think they are safe, without being led to deep searching of heart, and continued watching unto prayer; which will produce good works or fruits, and progress to sanctification, which must be attained before we are in a capacity to witness justification:—hence we have, especially in England, long lifeless sermons, calculated to fill the head, but never reach the heart.

O! how I have been tried with these communications like words of course, all the same from time to time, till the mind is wearied, and the heart that is panting for living bread is sick.

I believe we must be willing, till the Lord is pleased to say "it is enough," to bear and forbear,

(the cause is His) yet I have no doubt He sees the trials of His afflicted children; and although I may not live to see it, I fully believe this thing will not stand: but that the testimonies of Truth and the Christian doctrines given to this people to bear will not be allowed to fall to the ground: but that an honest, humble-minded people will be enabled again to raise the standard of Truth, and to promulgate the same, and carry on the work designed, thus marred by zeal and creaturely activity; and that the heterodox doctrines spread by Gurney and Ash, will remain on the shelf unasked for.

Before the late London Yearly Meeting it was insisted there should be no division, but all must be unity and harmony! as if true unity can be brought about by the contrivance of men, however influential!

Surely the true unity is in our Holy Head, Christ Jesus, and emanates from Him, the fountain of love; whilst all the contrivances of men will be found no more than as a rope of sand; and whilst harmony was being openly proclaimed, hundreds around knew that no such state of things existed!

J. N. RICHARDSON.

Glenmore, Ninth of Tenth Month, 1846.

The Twentieth Annual Report of the Association for the Care of Coloured Orphans.

TWENTIETH ANNUAL REPORT.

As the period returns which calls for a published statement of our yearly proceedings, we sometimes query with ourselves, what material have we to vary the oft told tale, and we are almost ready to desist from the attempt thus to renew an interest in our welfare; yet, in our brief sketches of the every-day concerns of a now old established Institution, we need not seek to gratify the taste for novelty, but simply to remind our friends of the little flock we are tending, and to meet the kind inquiries of those who may be asking "Is it well with the children?"

Our school remains under the charge of the same teachers as were in office at the time of our last annual report; and they continue industriously and efficiently engaged in the discharge of their duty,—the children giving evidence in good spelling, writing, and other exercises, as well as in general obedient conduct, of the care bestowed upon them. We were pleased lately on examining several specimens of creditable writing, with one by a little girl, in a good free hand, and correct spelling, containing sentiments of gratitude to her teachers for their instructions, and to her heavenly Father for her comfortable home and lodging—it being a spontaneous offering, clothed in simple but expressive language.

There are now 76 children in the Shelter, from 60 to 65 of whom attend school.

When we say that the Friend who has for many years fulfilled her trust so faithfully as matron, still occupies that station, it would seem superfluous to remark, that the different branches of her department continue to bear evidence of her carefulness and efficiency; whether we take a survey of the details of household economy, or observe the contented, healthful and neat appearance, and orderly deportment of the children—yet our well placed confidence does not preclude the regular inspection of our superintending committee, during the rotation of weekly visits.

The health of our large family has continued with little interruption; a circumstance which speaks well for the healthfulness of the situation, the wholesome and plentiful diet, and the constant care extended. Within the last few weeks, however, we have had a few cases of varioloid and small-pox, which yielded very soon under judicious treatment; and by timely vaccination of nearly the whole family, we trust its further extension has been stayed.

To our kind physician, Dr. Caspar Wister, who performed this arduous duty, as well as for his assistance so cheerfully rendered at all times, we are under much obligation; his prompt attention and medical skill, no doubt having often been instrumental in arresting disease; but above all, our gratitude is due to the Great Preserver whose tender regard, we humbly trust, continues towards our helpless charge.

The favourable accounts of those bound out, are we think, in good proportion to the whole number—our children are so young when apprenticed, that it would be hardly fair to attribute failures in good character to any supposed deficiency in their early training at the Shelter, and therefore we would not be deterred by such examples from endeavouring to sow the morning seed, as we know not but this also may prosper under the divine blessing—and we earnestly desire, that those to whom they have been indentured, may not be too easily discouraged on discovering such evil dispositions, the sad inheritance of a fallen nature, as may sooner or later be developed; but rather seek diligently for that grace in themselves, and in their charge, which is sufficient to enable them to persevere in the conflict, and finally to overcome.

It gives us pleasure to express our acknowledgments to Jacob Snider, Alderman, who most kindly executes indentures, and does all other business for us in his line, and by presenting to us his binding fees, becomes an annual donor to the Institution to a considerable amount.

It will be seen by a reference to our Treasurer's statement, that several of our deceased friends have kindly remembered us by a legacy; yet our regular income from annual subscriptions, and the interest on investments, still falls far short of our expenditures; so that if it had not been for seasonable replenishing by donations of money, provisions, clothing, &c., from many benevolent friends, to whom our grateful acknowledgments are due, we should have found it difficult to balance our accounts;—the high prices of provisions, which have occasioned such general distress, have drawn heavily upon our resources also; yet relying upon past benefits, we trust that while the sympathies of those who regard the poor are flowing so freely into new channels, the Shelter for Coloured Orphans will continue to be thus kindly remembered.

Summary of Treasurer's Account.

Balance on hand, First mo. 1, 1856,		$657 82

The greatest earthly blessings may be so unduly estimated, as to become our idols, and we may be as much ensnared by them, as endangered by our spiritual foes. A little reflection on the slightness of the tenure, by which we possess our temporary enjoyments, is sufficient to convince us, that we ought to hold them with a loose grasp—t them as not abusing them, that we may ourselves good stewards, "faithful over a things," and worthy through Him whom we to honour, to be made rulers over many thin his heavenly kingdom.—*Sarah Louisa Tay*

For "The Frie

On True Worship.

Much has been written and said of the natu the worship due from man to his Creator, c sublimity and its purity; but all is comprise the few, yet comprehensive words of the Al ing Redeemer and final Judge of all worshippe the woman of Samaria,—"God is a Spirit, they that worship him, must worship him in rit and in truth, for the Father seeketh suc worship him."

Whilst we neglect not the "assembling of selves together as the manner of some is," w is an important duty for all to whom abil afforded, let us not, when thus assembled, s our minds to wander from Him, who is the f tain of living water, for he has testified, "W soever drinketh of the water that I shall give shall never thirst, but the water that I shall him, shall be in him a well of water springin into everlasting life."

We may remember when "the sons of came to present themselves before the Lord, S came also amongst them," many are the de whereby he endeavours to draw the sincere, s ing soul from off the watch, and prevent it receiving that living water, which will alone rish and sustain the immortal spirit in this w and enable it to partake of the never-ending of a happy eternity. We may remember for encouragement the impressive language,—" sist the devil, and he will flee from you; d nigh unto God, and he will draw nigh unto y

As we are concerned to worship Him in s and in truth, he will, in the riches of his me cause us to feel the sweet incomes of his Di love, and refresh our hearts with his life—gi presence; giving us to know in whom our t is. It is by seeking him in "spirit and in tru that our path spiritually is known to be illumin by His blessed presence, warming and refresh our spirits; and a precious sweetness covers minds of those who, when assembled for di worship, thus seek him, which enables them experience the truth of the declaration,—"I good for us to be here."

When we reflect on the necessity, there is each one to endeavour to make their "calling election sure," and the uncertain period of t allotted to perform the great work, it behoo all to be vigilantly engaged therein. Theref may all who peruse these lines, and who may that they have not been worshippers of the " ther in spirit and in truth," seriously ponder importance, when assembled for that purpose endeavouring to turn their minds inward to Lord; who is a rich rewarder of all those diligently seek him, and who "giveth liber and upbraideth not to those who serve and upon him." For He regardeth the humble, contrite ones before him, and will cause them feel him to be riches in poverty, strength in we ness, and a present help in every needful tim strengthening them to overcome "the sin wh so easily besets them," and enabling them thro his power to experience hard things to be m easy, and bitter things to be made sweet, so t they will show by their devout waiting before h that he is indeed a God to be worshipped "in rit and in truth."

THE HUSBANDMAN.

arth, of man the bounteous mother,
Feeds him still with corn and wine;
e who best would aid a brother,
Shares with him these gifts divine.

lany a power within her bosom
Noiseless, hidden, works beneath;
lence are seed, and leaf, and blossom,
Golden ear, and cluster'd wreath.

'hese to swell with strength and beauty,
Is the royal task of man;
lan's a king, his throne is duty,
Since his work on earth began.

ud and harvest, bloom and vintage,
These, like man, are fruits of earth;
Stamp'd in clay, a heavenly mintage,
All from dust receive their birth.

Barn and mill, and wine-vat's treasures,
Earthly goods for earthly lives,
'hese are nature's ancient pleasures,
These her child from her derives.

What the dream, but vain rebelling,
If from earth we sought to flee?
'Tis our stored and ample dwelling,
'Tis from it the skies we see.

Vind and frost, and hour and season,
Land and water, sun and shade,
Vork with these as bids thy reason,
For they work thy toil to aid.

Sow thy seed, and reap in gladness!
Man himself is all a seed;
Hope and hardship, joy and sadness,
Slow the plant to ripeness lead.

John Sterling.

For "The Friend."

BIOGRAPHICAL SKETCHES,

nisters and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 140.)

CALEB PUSEY.

ne of the company (supposed to be Caleb Pu- spoke to this import: "The great God, who e the world and all things therein, conse- tly all mankind, Indians and English; as he e all, extends his love to all. This is plainly vn by his causing the rain and dews to fall on ground of both Indians and English alike, that ay equally produce what the Indians, as well hat the English sow or plant on it. He also es his sun shine equally on all. Seeing the t Being, who made all, extends his love to all, re mutually bound to love one another." The g replied, "What you say is true; and as God given you corn, I would advise you to get it for we intend you no harm." It was then rest time, and the people having fled from their is, the king's advice was very seasonable. messengers parted with him in a friendly ner, and returning to Philadelphia, soon ted the peoples' fears.

Caleb Pusey was first chosen a representative to General Assembly in the election in the fall 686. He was elected again the next year, and frequently afterward, when not acting as one he council.

The first important movement in religious so- y which we find him engaged in, was signing testimony against George Keith, in 1692; he that year a representative from Chester Quar- y Meeting, as he was generally thereafter until death. The pamphlets of Keith and his fol- ers, written against the Society of Friends in eral, and some of the Pennsylvania Friends in ticular, stirred up Caleb Pusey to take pen in d in support of the Truth. His first effort as ontroversial writer was entitled "A modest ac- count from Pennsylvania of the principal differences in point of doctrine, between George Keith and those of the people called Quakers, from whom he separated." This work was printed in London, there being no printing press in Philadelphia in the year 1696. It was an octavo pamphlet of sixty or seventy pages. I have not been able to find a copy of it in any public or private library.

In 1697 he was appointed one of the committee to examine all books proposed to be published by any member of the Society of Friends within the limits of the Yearly Meeting of Philadelphia. On this committee he was from time to time appointed as long as he lived. Many of the followers of George Keith continued their attacks of the Society of Friends for many years after separating themselves from it. Among them all none equalled Daniel Leids, for bitterness of feeling and pertinacity of purpose. His residence was at first in or near Burlington, but afterwards about Egg Harbour. He was a man of some talents and education, and prepared an almanac for a long series of years, commencing with one for the year 1687. This, for its lightness and frivolity, was suppressed by Friends in Philadelphia, and this probably was one cause of his ill nature towards them. About the year 1697, Daniel published a book entitled, "News of a Trumpet sounding in the wilderness, &c." This book, of which I have not been able to procure a copy, appears to have been filled with personal abuse of particular Friends, and misrepresentations of their doctrines and actions.

To this book Caleb Pusey prepared an answer, with this title—"Satan's Harbenger encountered, his false news of a Trumpet detected, his crooked ways in the wilderness laid open to the view of the impartial and judicious. Being something by way of answer to Daniel Leids, his book entitled, 'News of a Trumpet sounding in the wilderness, &c.,' wherein is shown how in several respects he hath greviously wronged and abused divers eminent, worthy, and painful labourers in the work of the Gospel in many places, by false citations out of their books, and in many other places by perverting their sayings and expressions; besides his otherways basely reflecting upon several antient Friends by name." Two texts were also in the title page: "And the men of Israel said, Have ye seen this man that is come up? Surely to defy Israel is he come up." 1 Sam. xvii. 25. "Behold he travaileth with iniquity, and hath conceived mischief and brought forth falsehood." Psalms vii. 16. John Wood, a minister of Gloucester county, West Jersey, added a few pages to clear himself from certain charges made against him by Daniel Leids.

In the Seventh month, 1698, the manuscript of the above answer was presented to the Yearly Meeting of ministers held at that time in Burlington, and was approved and directed to be published. There were many difficulties in the way of getting a book hastily through the press of Reynier Janson,* and it was not until 1700 that it was presented to the public in a quarto volume of 124 pages. Many typographical errors defaced the book, in respect to which Caleb Pusey says in the preface, "The chief occasion of their being so the less, is, that I was forced to employ one of many errors was the printer being a man of another nation and language, as also not bred to that employment, consequently something unexpert both in language and calling, and the corrector not being so frequently at hand as the case required."

The design of his book, he informs us, was to prevent any from being deceived, and to open the eyes of such as had been deceived by Leeds' book. He was satisfied that notwithstanding all attacks made on it, "the truth remained the same." "And as the way of its working is to cleanse and purify mankind in soul, body and spirit, and make them fit temples for God to dwell in, by virtue of his Holy Spirit in us, and also to entitle us effectually to partake of the great and unspeakable benefit that accrues to mankind by that one offering of our Lord Jesus Christ on the tree of the Cross: so it is highly necessary that we more and more come to experience this cleansing work to be wrought in us, in order to be entitled to the benefit. For although our blessed Lord Jesus Christ offered up himself for the sins of the whole world, yet we read of none who by that offering are forever perfected but those who are sanctified."

We shall not attempt to give an analysis of this work, those who are anxious to obtain a full knowledge of the actions of George Keith and his followers, will find many things to interest them in Caleb Pusey's writings. In 1699, Caleb Pusey was appointed one of a committee to draw up a statement to be sent to England, of the number of the followers of George Keith, who had gone to the Priests.

Daniel Leeds continued to publish his almanac and to make it a vehicle for attacks upon Friends, particularly William Penn and Caleb Pusey. His almanac attacks and two printed challenges, brought forth Caleb Pusey in 1702 once more before the public, in a quarto volume. His book was called, "Daniel Leeds justly rebuked for abusing William Penn, and his folly and falsehood, contained in his two printed challenges to Caleb Pusey, made manifest."

In the various attacks made on Caleb Pusey, he is frequently referred to as a miller, and seems to take the jeers of his antagonists on his "miller's logic" in good part. He seems to have been ready to meet his opponents in whatever field of warfare they entered, and we find him preparing matter for almanacs to refute the attacks made on Friends in Almanacs. The calendars were probably calculated by Jacob Taylor, who we know prepared and published one for many years. The paragraphs prepared for one of them were so unpalatable to some, that an anonymous attack on Caleb Pusey for writing them was drawn into the Yearly Meeting. The subject was referred by the Yearly Meeting of ministers to a committee, of which Caleb Pusey was one, to prepare a suitable answer to the attack.

In the year 1701 or 1702, John Richardson, being on a religious visit in this country, staid a while at the residence of his friend Caleb Pusey. His mill was on the edge of the wilderness, in which the Indians still resided, and many of them were located near at hand. John Richardson, walking in the old venerable forest, saw several of the Indian wigwams, and drew near to them, but he could not converse with the inhabitants. As he looked upon them, however, he felt the love of God flowing towards them, and in that love he afterwards sought out an interpreter, with whom he again visited them. He told them that he came with a message to them from the *great man* above, to persuade them not to kill, steal, get drunk, nor put away their wives for small faults, for the great and good Being would be offended with them if they did such things. On the contrary, if they refrained from evil, God would love and prosper them, and give them peace. The Indians shed tears whilst listening to the good tidings, and gave quick credence to the divine authority with which he spoke, and to the truth of his sayings.

(To be continued.)

*Reynier Janson was a native of Holland.

Florida Sea Island Cotton.

Sea Island cotton is one of the grand productions of Florida. From her insular position, quality of soil, and blandness of climate, this delicate and valuable crop is very successfully cultivated. It is said that this crop is produced the best where the soil is composed of clay, strongly mixed with vegetable decomposition. As a manure for cotton lands, sea-weeds and marsh-mud are found to be excellent, increasing the quantity of the crop without injuring the fineness and glossiness of the staple. The cotton seed is planted in rows, from six to eight feet apart, and the plant kept free from weeds by the use of the hoe and plough. The shrub grows rapidly, and throws out a profusion of rich yellow bloosoms, and at length the pods appear. These, bursting open about Ninth mo., reveal their snowy treasures to the planter's gaze. The field must now be picked, as exposure to the weather injures the fine gloss of the cotton. The down is collected, exposed on a scaffold to dry, and is then passed through the gin, whose thousand fingers quickly separate it from the seed, after which it is packed in bales, and is ready for the market. As the pods do not open all at a time, several pickings are necessary to clean the field.

The cotton shrub grows very luxuriantly in Florida. The writer has seen a specimen produced in Marion county, which more resembled a tree than a shrub, the lower branches being sufficient to sustain the weight of a man. The cotton crop is liable to many accidents; the caterpillar sometimes destroys whole fields of it; the red-bug pierces the pod and discolours the cotton, and a heavy wind sometimes entirely destroys the pod. Good cotton lands will yield three or four hundred pounds to the acre, and it is said that one hand may cultivate about three acres. The price of the article varies according to the quality and state of the market, from fifteen to twenty cents per pound.

To every hundred pounds of cotton produced, there are about ten bushels of seed, weighing forty pounds to the bushel. Experiments have been made in turning the seed to account, by extracting oil from it; and we believe the result has proved that about half a gallon of crude oil may be obtained from the bushel. The oil cake may be also used for cattle and horses. It is thought by some that the seed used in this way would pay one-half of the labour required for the cultivation of the crop.—*Florida News.*

For "The Friend."

Hold fast your Confidence.

Many and deep are the provings of the faithful followers of the Lamb, in this day of great departure from the life and power of godliness by many under our name; and they are at times clothed with the spirit of prayer, that the Lord, in the riches of his mercy, would be pleased to turn the captivity of Zion, and bring her sons and daughters under the government of his pure Spirit in their hearts, whereby they would be drawn more unreservedly to conform to the ancient faith, and to adhere more and more firmly to the discipline and order of our religious society, exhibiting their practical effects by their lives. These ought not to let go their confidence in the all-sustaining and preserving power of the Shepherd of Israel, to keep them from the assaults of the enemy, whether from within, or without them; for as they are found lying low before him, he will keep and support them, and in his own time give them to witness the fulfilment of that scripture declaration, "The Lamb and his followers shall have the victory."

Those who have through the Lord's mercy been favoured to experience being brought into that blessed inheritance, which the faithful of every generation have highly prized, and which they have obtained, not by right nor by power of their own, do travel in spirit for the welfare of Zion and the enlargement of her borders, and when there is a drawing back or turning aside from the holy commandment delivered unto them, by any, it occasions suffering; and such can adopt the language of the Apostle, "If any man draw back, my soul shall have no pleasure in him." May such as have been favoured in the light of the Lord to see the stratagems of the enemy for laying waste his heritage, by removing the ancient land-marks and inducing many by his plausible reasoning and a desire to shun the cross, to believe that there is but little or nothing in this, that, or the other of the testimonies appertaining to our high and holy profession, stand as with their loins girded, their lamps trimmed, and their lights burning; for every part of the doctrines, and every testimony laid upon this people in the beginning, to uphold, remain binding upon it now; Quakerism carried out, being nothing more nor less than primitive Christianity revived.

The fervent desire of my heart is, that the faithful in every part of our society, who are endeavouring to walk in the good old way, the ancient paths, who cannot join with the multitude in owning as a true Yearly Meeting those who have seceded in Ohio, may be favoured to keep in the faith and in the patience of the saints, and the Lord will work in them and for them, to his own praise, and to their unspeakable joy and peace, opening a way for them in his own time. O! my beloved friends! hold fast your confidence, firm unto the end; let no plausible reasonings prevail over you, but endeavour to stand in that light which our blessed Lord and Saviour may favour you with, and you will be kept in the meekness and gentleness of Christ; being willing to suffer for his sake all his appointed time.

The society of Friends may be greatly reduced in numbers by the compromising, separating spirit, which has for some years past been at work within our borders; but let all whom the Lord hath quickened by his Spirit, and brought out of Egyptian darkness into his marvellous light, and who feel bound to uphold the ancient faith, the testimonies and the discipline of our religious society, endeavour to get under, and keep under, the government of a right spirit, and all hastiness will be kept down; and all judging of one another because we may not see eye to eye in some points, will be guarded against; remembering that our friends who may differ from us have the same privilege of access to the Spirit of Truth that we have; and thus we will be kept near to one another and waiting for one another, and the enemy will not be suffered to gain the ascendency over us. And if, through unwatchfulness, he should unhappily get within the camp, help is laid upon One that is mighty, and he will thrust him out if we are individually concerned to get right and to keep right ourselves. Then as a well disciplined army, under the Captain of Salvation, we would be enabled to go forth, conquering and to conquer our soul's enemies, and the church, however much diminished in numbers, would appear in her primitive beauty, to the praise and the glory of her adorable Head.

My faith is unshaken in the continued mercy of the Lord our Helper, and I feel for the little remnant up and down in the land, who may be compared to the gleanings of the vintage, the two or three berries in the top of the uppermost bough; and I can say that my life is bound up with the life and prosperity of these, wherever situated c

Story of a Tea-kettle.

winters evening, nearly one hundred years
e tea board was laid out, and the window
s closely drawn, in the humble parlour of a
ouse in the town of Greenock, in the West
land. A tidy, active matron, was bustling
slicing the bread and butter, a blazing fire
d and roared in the grate, and curled round
ck sides of the kettle which reposed in the
of it, and the fire crackled, and the water
with a faintly heard popling sound, and a
of white vapour came whizzing out of the
'the kettle, with a shrill cheery hiss. Now the
aforesaid saw nothing particular in all this;
had boiled and fires had burned from the
ng, and would probably do so to the end of
pter.

he matron stooped to pour the boiling fluid
tea-pot, her son James, a boy of twelve
rs, sat on a low bench in front of the fire,
ows resting on each knee, while his hands
ed his head, being placed under the chin;
was intently gazing at the fire, the kettle
e steam, swallowing them with his eyes, ab-
in deep thoughts, and lost in contempla-
The boy looked at the fire, and the mother
at the boy. "Was there ever sic an idle

above anecdote is literally true. Watt was
in 1736. This incident occurred when he
his twelfth year. He was the son of a poor tradesman in Greenock, in Scotland, and probably had never read a book, the spelling book and the Bible excepted.

From the Journal of George Fox.

Dear Friends and brethren—who have known the Lord's eternal arm and power, that hath preserved you upon the heavenly rock and foundation, and hath built your house upon it; you have known many winds, tempests, and storms, that have risen out of that sea where the beast rose; and many raging storms that have risen by apostates of several sorts; but the Lord that bruises the serpent's head, and is the foundation of God's people, stands sure. Dear Friends and brethren, though there be great shakings in the world, the Lord's power is over all, and his kingdom cannot be shaken. Therefore, all ye children of God, children of the light, and heirs of his kingdom, a joyful, peaceable habitation keep in; keeping out of all the contentions and disputes about things below. Lay hand on no man, nor nothing suddenly, lest they should be puffed up with that which fades, and so come to loss; but mind the Lord's power, that keeps open your heavenly eye, to see things present and to come; and in that ye will see and handle the word of life.

Dear Friends everywhere, have power over your own spirits. As God hath blessed you with outward things, have a care of trusting in them, or falling into difference one with another about these outward things that are below, which will pass away. But all live in the love of God, and in that live in peace with God, and one with another. Follow the works of charity, and overcome evil with good to all; for what good have all the tinklers done, with their cymbals and sounding brass? They always bred confusion, and never did good in any age; tinkling with their cymbals, and sounding with their brass, to draw out the simple to follow them. Therefore it is good for all the children of God to keep in their possession of life, and in the love of God, that is everlasting.

As for all the tumults of the world, and the apostates from the truth, the Lord's power is over them all, and Christ reigns; and the Lord saith, "No weapon that is found against thee shall prosper." Isa. lxv. 17. Now, Friends, you are not insensible how many weapons have been formed against us, who are the sons and daughters of God; and the Lord hath restrained them according to his promise; they have not prospered. The Lord said, "Every tongue that shall rise up in judgment against thee, thou shalt condemn;" so God hath given such a power to his children, to condemn all the tongues that shall rise up in judgment against them; and this is the heritage of the servants of the Lord; "their righteousness is of me, saith the Lord." You are not insensible of the many tongues that have risen up against us in judgment, yea, of apostates and profane, but in and with the truth, the power of God, according to the promise of God, "every tongue that riseth against thee, thou shalt condemn." It is not one tongue only thou shalt condemn, but "every tongue that shall rise up in judgment against thee, thou shalt condemn." The Lord giveth this power to his servants and children, to judge the evil tongues; and he doth restrain the weapons found against them, so that they shall not prosper against his children that he hath begotten. Praises and honour be to his holy name forever. Amen. G. F.

Third month, 1689.

It is always term time in the court of conscience.

For "The Friend."

Profitable Reflections.

We are never well informed of the truth, till we are conformed to the truth.

Speak of people's virtues, conceal their infirmities; if thou can say no good, say no ill of them.

Religion begins with a knowledge of *man's self*, and is perfected with the knowledge of God.

We may know what Christ hath done for us, by what he hath done *in* us.

None are so easily acquainted, so closely knit together, and so much endeared to one another, as *real* Christians.

One true Christian differs from another *without* breach of charity, as friends love one another, though in different garbs.

When Paul was a Pharisee, he thought he was blameless; when he was a Christian, *the chief of sinners*.

Judge thyself with a judgment of sincerity, and thou *wilt* judge others with a judgment of charity.

A zealous soul, without meekness, is like a ship in a storm, in danger of wreck.

When the Christian is most sensible of *his own weakness*, and most dependent on Christ's strength, then he stands safest; when he is most vile in his own eyes, he is most glorious in the eyes of God. When Job abhorred himself, then God raised him. When the centurian thought himself the most unworthy, Christ said, "I have not found so great faith, no, not in Israel."

THE FRIEND.

FIRST MONTH 26, 1856.

In our present number will be found the twentieth Annual Report of the Association for the care of Coloured Orphans, and we once more commend the Institution to the generous charity of our readers. We believe there are few more worthy of it, whether as regards the humane object for which it was established, or the manner in which that object is carried out.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 5th instant. The cotton market was dull, and prices had declined $\frac{1}{8}d$. The sales of the week were 24,000 bales. Breadstuffs were also dull of sale; the quotations were from 40*s.* to 42*s.* 6*d.* per bbl. for flour. White wheat, 11*s.* 8*d.* to 12*s.* per 70 lb.; red wheat, 10*s.* 8*d.* to 11*s.* The bullion in the Bank of England had decreased £170,000; there was greater stringency in the London money market. Consols, $87\frac{5}{8}$ a $87\frac{3}{4}$.

The War.—A Grand Council of War is to be held in Paris, to collect, interchange and consider all possible information relative to the war. Marshal Pelissier is said to have given his opinion, that no further success for the allies is possible on the present base of operations. On the 16th ult., a detachment of Cossacks defeated a strong squadron of British cavalry near Kertch. The English commander was made prisoner. Large bodies of Russian troops were marching from the Crimea to Bessarabia, and the places of the retiring troops were being filled from the reserves. Omar Pacha had made a retrograde movement with his army, renouncing his intention of attacking Kutais. The greater part of the Russian army will winter at Kars. The Russians found in that city 3000 wounded men and 250 cannon. The Russians hold the defile between Kars and Erzeroum, and many persons were leaving the latter city under the apprehension that it might be attacked. The advices from Sweden are warlike. The military commanders have received instructions to have their respective regiments in the highest state of efficiency before spring. The indications are, that in accordance with a secret article in the recent treaty, Sweden will join the allies in active hostilities against Russia. The allies are making active preparations to throw upon the Rhine, in the neighbourhood of Strasbourg; an army of 180,000 soldiers intended first to force the German States, and es-

pecially Prussia, into some sort of an alliance by which the commerce between her and Russia will be cut off, and the latter power isolated; and secondly, to act against Russia through Poland. The Danish government, it is said, consents to the establishment of depots for the English fleet at Kiel, which will rendezvous there in the spring.

RUSSIA.—Count Esterhazy reached St. Petersburg on the 26th of last month, and the next day laid the peace propositions of Austria before the Russian Cabinet. From the tenor of a circular issued by Count Nesselrode, it may be inferred that the demands of the allies in relation to the Black Sea, will not be assented to by Russia. That power, however, proposes, "That the right of Turkey to close the Straits, shall be maintained; that no ships of war shall be admitted into the Black Sea, excepting Russian and Turkish; that the number of ships shall be mutually arranged by Russia and Turkey, by special treaty, and by these powers alone." Contracts have been advertised for immense quantities of artillery stores, and new rifle regiments were being enrolled. The Czar has issued a decree conferring on peasants the right to possess landed property in Poland. Personal serfdom is to be replaced by annual payment. Three years are allowed for the execution of the decree.

INDIA AND CHINA.—Martial law had been proclaimed in the Santhal district. The insurrection had not been suppressed, but was no longer dangerous. A battle occurred on the 7th of Eleventh month, in Oude, between the insurgents and the British troops, the latter assisting the troops of the King of Oude. Five hundred dead were left on the field, and the insurgents dispersed; the country was still unsettled. The order prohibiting the export of saltpetre from India, except to England, was loudly complained of. Chinese affairs remained unchanged. A horrible affair had occurred at Manilla. The American ship Waverly, with 442 Chinese labourers on board, had put into that port, to inter the captain, who had died at sea. Some trouble ensuing among the Chinese, the mate shot two or three of them, and driving the rest below, fastened the hatches, and went on shore to attend to the burial of the captain. When he returned and opened the hatches, 250 of the Chinese were found to have died from suffocation. The mate and crew had been imprisoned by the Spanish authorities.

UNITED STATES.—*Congress.*—The House had not organized on the 21st inst. The contest for the Speakership has been maintained with an obstinacy which might seem amusing, were not the parties to the strife convened as *legislators* for the performance of grave and important duties affecting the interests of a great nation. Although daily repeated ballots show, that the members will not concentrate their votes, so as to give a majority to either of the candidates, they yet continue unwilling to allow an election to be made in any other manner.

Bounty Land Warrants.—The total number of applicants for bounty lands at the Pension Office, to Twelfth mo. 31st, 1855, was 232,200; and the number allowed or granted, 77,700 out of 136,524 examined.

Ohio.—The receipts into the State treasury during the year 1855, amount to $4,215,854, and the expenditures to $3,512,484. The total debt of the State is $14,008,295.

Chicago, Ill.—The receipts of grain the last season, were 20,457,983 bushels; of lumber, 336,553,497 feet. No other city in the United States receives so large an amount of these articles.

North and South.—The number of patents issued from the Patent Office last year, is very unequally divided between the two sections. To residents in the free States, 1684 patents were granted; to those in the slave States, 222; and of these, 112 were for Virginia, Maryland, and the District of Columbia, leaving only 110 for all the rest of the South.

The Eastern Cities.—A large portion of the entire wealth of the nation appears to be concentrated at the great commercial points of the United States. One-eighth part of the whole property of this country, according to the Boston Traveller, is owned by the citizens of New York and Boston. Boston alone, within its corporate limits, owns, it is stated, one-twentieth of the property of the entire union. Providence, R. I., is also a wealthy city, having an assessed valuation of 56 millions, with a population of only 50,000.

Washington, D. C.—In a table published in the Washington (D. C.) National Intelligencer, it is stated that there were 254 new houses erected in Washington during the year 1855, making the total number 8920. The number of inhabitants is estimated at 58,201. The assessed value of all kinds of real and personal property, including bank and other stocks, is $25,568,703.

New York.—The assembly organized on the 16th, having previously agreed that a plurality might elect, Orville Robinson was chosen Speaker by a union of Republican and Democratic votes. From the Governor's Message the following items are gleanned. The population of the State by the census of 1855, is 3,470,063; an increase since 1850 of 372,024. The number of aliens was 632,746; coloured persons not taxed, 35,956; Indians, 3945. The number of children of proper age, to attend school, was 1,233,987, of whom 900,523 were at district schools, 38,734 at academies, 53,764 at unincorporated schools. The number of the school districts is 11,728. Expenses of the public schools, teachers' salaries, $2,301,411; libraries, $55,416; school buildings, &c., $863,990; total, $3,220,817. The State canals produced last year $2,639,792; expenditures, $989,792; net income, $1,650,000. The State revenue falls short of the expenses, about $250,000. The Governor recommends the construction of another Asylum for the insane.

Philadelphia.—Mortality last week, 220; there were 33 deaths from small-pox, and 2 from varioloid.

Miscellaneous.—Cold in Texas.—At San Antonio, the weather has been unusually severe. The temperature had fallen to 19°, and ice, three inches thick, had been formed.

Planing Machines.—It is calculated that there are now over thirty thousand planing machines in the United States, each doing the work of sixty men. If this statement is correct, no less than 1,800,000 men would be required to perform the work now done by the machines.

African Colonization.—During the year 1855, 207 emigrants to Liberia were sent out by the American Colonization Society. The receipts of the Society for the year were $55,276. The annual report gives an encouraging view of the affairs of the Liberian Republic.

The Reading Railroad.—The receipts of this road for the last year, were $4,321,793; of which the chief item was for freight on coal. The quantity brought down was 2,213,292 tons, and the freight charged $3,664,094. The net profit of the year's business is stated to be $2,593,915.

Farming in Virginia.—A farmer, of King George county, bought four hundred and fifty acres of land in 1851, for $4500. One half was in wood. From that time to this time he has spent in cash, for manure, about as much as the land cost him. In 1852 he says that he sold twelve hundred bushels of wheat; in 1853, two thousand one hundred bushels; in 1854, one thousand three hundred bushels; and last year two thousand five hundred bushels. He has also made an average surplus, each year, of one thousand bushels of corn, and six hundred dollars' worth of hay.

Fast Sailing.—The clipper ship Bald Eagle, of Boston, Mass., arrived at Callao, Eleventh mo. 26th, from China, on a passage of eighty-three days, a distance of 15,662 miles. On the last thirty-seven days of the passage, she averaged two hundred and three miles per day; the average of the whole passage was one hundred and eighty-nine miles per day.

Coffee from Brazil.—The quantity of Coffee imported from Brazil greatly exceeds that imported from all other countries. It amounted last year to 135,000,000 pounds, against 21,000,000 of St. Domingo, 15,000,000 of Venezuela, and 8,000,000 of Java.

Extreme Cold.—At Chicago, on the night of the 8th, the thermometer stood 30° below zero. At St. Paul, Minnesota, it was recently 28° below; during the day it ranged from that to 10° below, and at 7 P. M. stood 20° below.

The Jamaica Sugar Crop.—The N. Y. Sun says, "The sugar crop on the Island of Jamaica this season, is 50,000 hhds. greater than ever before. This is attributed to 'Yankees' having taken the management of several of the largest sugar estates. In working, they employ the negroes at so much per day paying *in cash* every week." The cash payments are said to have waked up the labourers, and imparted new life to the whole business.

Marine Disasters.—The severe storm in the early part of the month, occasioned the loss of many vessels upon and near our coasts. The packet ship St. Denis, from New York for Havre, foundered on the 6th inst. The captain and most of the crew, and all the passengers were drowned. The St. Denis was a large vessel, valued at $60,000, with a cargo of grain, flour, &c., worth $120,000. Eleven of the seamen saved themselves in one of the boats; all the rest on board, thirty-four in number, perished.

A Dreary Winter Home.—A letter from Carp river, Lake Superior, dated Twelfth mo. 11th, published in the Green Bay (Wis.) Advocate, states that much suffering was anticipated this winter in that region. Pork, butter and lard could not be had at any price, and was scarce at $25 per bbl. The snow was about feet on the level, and no mail had been received weeks.

The English and French Exhibitions.—The London bition of 1851 was visited by 6,039,195 person ing the 155 days it remained open. That in Pa 1855, was open 198 days, and was visited by 4,2 persons.

The Flour and Grain Markets.—The quotations three principal cities on the 19th, were as follo *New York*, flour, State, $8 a $8.12½; Southern, $ a fair export demand; red Southern wheat, Western, $1.80. *Philadelphia*, flour, $8.25 to $ for shipping brands, and $8.50 a $8.75, for extra wheat, $1.95 a $2.00; white, $2.10 a $2.20. *Bal* flour, $8 a 8.12½; corn, 74 cts. a 76 cts. for yellow 73 cts. a 75 cts. for white.

SOUP HOUSE.

The Society for supplying the poor of the city soup, have opened their house, No. 16 Green's and are daily delivering soup, (First-days excep between the hours of 11 and 1 o'clock, to such ne tous poor as produce a recommendation from respectable person.

As the Society is dependent for means to support useful charity, on the annual donations of the ben lent, they respectfully solicit aid from such as ma disposed to contribute. Donations in money ma sent to the Treasurer, Jeremiah Hacker, No. 144 S Fourth street, or to Thomas Evans, No. 180 Arch s

Beef, flour, beans, rice or other vegetables wi gratefully received at the soup house.

Friends' Boarding-School for Indian Children, a Tunessassah.

Two women Friends are wanted at this Institute assist in the family.

Also, a man Friend to aid in carrying out the cern for the improvement of the Indians.

Application may be made to JOSEPH ELKINT 377 S. Second st
THOMAS EVANS,
Philad., Eleventh mo. 1st, 1855. 180 Arch st

WEST-TOWN BOARDING SCHOOL.

Wanted, a Teacher of the Classical Department in Institution.

Application may be made to either of the undersig members of the Committee.

SAMUEL HILLES, Wilmington, Del.
THOMAS EVANS, } Philada.
SAMUEL BETTLE, Jr. }

MARRIED, on Fifth-day, the 8th of Eleventh mo 1855, at Friends' Meeting, Middletown, Delaware Pa., THOMAS SMEDLEY, of Harford Co., Md., and PRI YARNALL, of the former place.

DIED, on the 9th of Twelfth month, 1855, MARY wife of James E. Mott, of Plymouth Particular Monthly Meeting, in the 35th year of her age. She a severe illness of eight days with remarkable patie during which she said but little, though her mind se ed calm and composed. Her affectionate disposition endeared her to a large circle of friends, who have consolation to believe that she has exchanged this st of existence for an admittance into a mansion of rest peace.

——, on the evening of the 15th ult., at the residen of her sister in Hamorton, Chester Co., Pa., ELIZAB ELLIOTT, of Philadelphia. This dear Friend bore sufferings of a protracted illness, with exemplary tience and resignation, yet often desiring that if it the will of her heavenly Father, the work might be short in righteousness. Her friends have the consol belief, that her redeemed spirit has through mercy b permitted to enter into a heavenly mansion.

——, on the 7th instant, at his residence in Cay county, N. Y., JOB ORTIS; a member of Scipio Mon Meeting. Having "kept the faith," he quietly peacefully finished his course, in the 73d year of age.

——, on the 12th inst, in the 63d year of her REBECCA BARTON; a member of the Monthly Meetin Friends of Philadelphia for the Southern District.

——, on the 13th inst., in the 81st year of his JASPER COPE; a member of the Monthly Meetin Friends of Philadelphia for the Western District.

THE FRIEND.

A RELIGIOUS AND LITERARY JOURNAL.

L. XXIX. SEVENTH-DAY, SECOND MONTH 2, 1856. NO. 21.

PUBLISHED WEEKLY.

Two Dollars per annum, payable in advance.

Subscriptions and Payments received by

JOHN RICHARDSON,

Boyhood Underground.

(Concluded from page 154.)

pushers or hurriers are a class of older lads ie trappers, their employment requiring a erable amount of strength, often involving only less onerous than that of the adult . In some districts, the thickness of the am admits of horses or ponies being brought he spot where the men win the coal. This ase in general in the larger mines on the f Cumberland, and horses convey it directly he workings to the shafts. In the immense ine William pit, where there are five hun- res under the sea, and the distance is two nd a half from the shaft to the extremity works, there is a stable, likewise under the r forty-nine horses. The animals are let n large nets, and, having once become sub- an, they never see daylight again. But nly the seams are too narrow to allow of being employed to transport the coal the distance; and it has to be conveyed to where rse-ways commence by stout lads or young rom thirteen years of age and upwards, in or carriages. For the same reason, the ss of the seams, they cannot work in an t position, but have to crawl on hands and or assume a nearly horizontal posture. rly this process was performed by means of e, or broad leather strap, fastened around ist, to which a chain from the carriage was and passed between the legs, the boys g and drawing the carriage after them. rdle frequently blistered the sides of the s, occasioning great pain, and the labour of g the vehicles on the bare floor, unfurnished ails and sleepers, was very severe. This ous and slavish practice may not be alto- out of use at present; but respectable com- and masters with capital, have discon- it for many years, substituting small iron rs, along which the carriages are pushed omparative ease. The hurriers place both at the top of the back of the corves, and hem forwards, running as fast as the in- on of the road or their own strength will . The vehicles vary greatly in size, carry- m two to ten hundredweight of coal; but mmonest size in the thicker beds are made l six hundredweight, weighing about two edweight themselves. The whole burden is eight hundredweight. Three boys hurry a wagon on rails. The one in front draws; the two behind push forwards. Their heads are brought down to a level with the wagon, and the body is almost in a horizontal position. This is done partly to avoid striking the roof, and partly to gain the advantage of the muscular action, which is greatest in that position. By constantly pushing against the wagons they occasionally rub off the hair from the crowns of their heads, so much so as to become almost bald. The work is performed with surprising celerity; and though the toil is hard, there are varieties and intervals which render it anything but irksome. In fact, the hurriers are a somewhat uproarious class, go through their drudgery cheerfully, devouring at fixed times huge batches of "bait," and often earning, in the case of the oldest of them, from 3*s.* to 3*s.* 6*d.* a-day. Of course, from the nature and scene of their labour, accidents may be expected to be common, wholly distinct from the tremendous catastrophes from fire-damp, of which they stand in jeopardy every hour while below the surface. Fractured limbs, wounds, and other lamings often fall to their lot. But the hardy fellows are soon at work again, and only keep in mind their lamings to serve the purposes of chronology. When referring to the time of an event, a pit-boy will frequently simply indicate it as just before or after "last laming."

A stranger meets with many oddities in a coal district. We must be content with one example, giving it in the form of a dialogue. "What is your name?" "Benjamin Berry." "How old are you?" "Thirteen." "What is your work?" "A drawer." "What wages do you get?" "Three-eighths." "What do you mean by three-eighths?" The explanation is, that at Worsley, it is customary to consider a man as divided into eight parts, each of which bears a value corresponding to that of the whole. Thus a boy of ten years of age, is considered equal to, or worth two-eighths of a man; at fifteen, one-half; and at eighteen years, three-fourths.

Boyhood underground has occasionally been followed by an illustrious manhood in more agreeable scenes. Bewick, the celebrated wood-engraver, began life in a colliery near Hexham. One who knew him well speaks of having often heard him say, that his remotest recollection was that of lying for hours on his side between dismal strata of coal, plying the pick with his little hand, by the glimmering light of a dirty candle. Hutton, the mathematician and teacher, who had chancellor Eldon for one of his pupils, had a similar origin. But a far more extraordinary example of rise in the social scale from the very humblest occupation in a colliery, has occurred within the memory of the present generation. At the Euston station of the London and North-western railway, a statue of Carara marble, resting on a pedestal of the same material, commemorates George Stephenson, the inventor contemporaneously with Sir Humphrey Davy of the safety lamp, the first great practical improver of the locomotive steam-engine, and the author of the railway system which has so rapidly extended its network over a large portion of the globe, and contributed to unite nations in the bonds of commerce and peace. His early days were spent as a trapper in Wynam colliery, near Newcastle-upon-Tyne. With unflagging spirit he plodded his way through various departments of labour, illustrating each with the light of genius, and adorning it by personal integrity and domestic virtue. "I have," said he, in an after-dinner speech, "worked my way; but I have worked as hard as any man in the world, and I have overcome obstacles which it falls to the lot of but few men to encounter. I have known the day, when my son was a child, that after my daily labour was at an end, I have gone home to my single room and cleaned clocks and watches in order that I might be able to put my child to school. I had felt myself too acutely the loss of an education not to be sensible of how much advantage one would be to him." Few individual changes have been more remarkable; a trapper, sitting in weariness and darkness, string in hand, attending to his doorkeeping, never seeing the sun in winter, except on Sunday, the hours from before daylight to dusk being spent in the pit, becoming the great engineer of modern times, courted by nobles, the guest of kings and queens, in possession of an ample fortune, and a reputation limited only by the bounds of civilization.

From "Old Humphrey's Portfolio."

The Loss of Children.

The loss of children is among the heaviest trials that parents have to endure. How many a one who held his head high has been brought down to the very dust by the death of a child!

David, king of Israel, was a mighty man, and he had a heart often bold as a lion! but when the news reached him that his rebellious son Absalom was dead, he went up into his chamber, and wept. We may judge by his language of the intensity of his grief. "O my son Absalom, my son, my son Absalom!" says he, "would God I had died for thee, O Absalom, my son, my son!"

When Jephthah found that his rash word had made him fatherless, by dooming to death "his only child; beside her he had neither son nor daughter;" how great was his affliction! "And it came to pass, when he saw her, that he rent his clothes, and said, Alas, my daughter! thou hast brought me very low." "A voice was heard in Ramah, lamentation and bitter weeping; Rachel weeping for her children, refused to be comforted for her children, because they were not." Jer. xxxi. 15. That must be no common grief that refuses consolation, and this strong figurative description of it is very forcible. A mother carried away into reckless affliction by her agonizing solicitude for her departed child is an affecting picture. But why should we go back thousands of years? Is not death among us now? Is it not in the habitation of our neighbours? nay, in our own dwellings? Experience! tell us somewhat of the scenes thou hast witnessed. Memory! let thy scroll be unrolled, bestained as it may be with thy tears.

We knew one who carried himself high, and thought much of titles and worldly distinctions: his estate would have lost its value, in his estimation, if he could not have transmitted it unimpaired to his son. High as he was, and wedded to family genealogy, yet was he kind and courteous

to an extreme. How was he changed in a moment! His child died; his kindness and courtesy forsook him; and when we paid him a visit of condolence, a bear robbed of her whelps could hardly have been more irascible. For a season he completely abandoned himself to his grief. Why should we thus rebel against God? "Behold, he taketh away; who can hinder him? who will say unto him, What doest thou?" Job ix. 12.

Well do we remember Jennings, a village blacksmith. He was a man, strong, and proud of his strength. Seldom have we seen a broader back than his, or a thicker arm. His iron frame seemed tied together with sinews of wire, and yet for all this we have seem him sit down in his chair, and cry like a child. We happened to call in when his poor babe lay dead in its little crib; and the strength of the strong man was brought low, and the pride of the proud man was humbled. Jennings would have borne pain and privation like a martyr, but he could not bear the loss of the little one that he had dandled on his knee, and folded in his strong arms. When we saw such a man as Jennings sobbing and weeping, it was all in vain for us to try to restrain our tears.

It was in a lovely country, studded with beautiful lakes, tarns, waterfalls, and romantic mountains that we made a call on an aged man, whose thoughtful brow wore a gloom in the midst of his kindly attentions. He showed us the goodliest prospects, and took us to the most favourable points from whence we might observe them. He walked with us through the deep seclusions of his delightful abode, and he took us to a bowery alcove, where we seated ourselves beside him. It was here that, conversing on the shadowy past, his voice faltered, and the tears rolled down his time-worn cheeks!

But why was it that the aged man was beclouded with grief? Alas! he had lost a daughter. With her he had gazed on the fair prospect around us; with her he had again and again roamed where we had wandered, and with her he had sat in the leafy bower in which we were then seated. We knew what it was to lose a child, and we could not be unmoved. It was the Laureate of England, who was weeping beside us.

We lately visited, among our christian friends, a married pair who had lived in a sultry clime, where the voice of the Lord is heard in the hurricane, and the torn plantations bow beneath the whirlwind. They had pitched their tent in England's milder clime. Peace had taken up her abode with them; and their numerous offspring were as olive plants around their table. The refinements of life were blended with holier hopes; and books, languages, &c., though enjoyed, were as the dust of the balance compared with the things of eternity. The father looked on his progeny with affectionate exultation, and the mother with conscious pleasure, though she had her solicitude. So is it sometimes with the poor bird that appears to be happy with her young, when, alas! there are thorns in the nest which pierce through the down that lines it, known and felt by her alone. Time passed on, and we again called at that habitation. Death had been among its inmates, and taken away a daughter. Few words were spoken about her by her bereaved parents, but those few told us that grief had been busy at their hearts.

Be comforted, ye afflicted ones, in following your beloved to her heavenly home. "Had she been spared to you, how slowly could you have taught her, and in the full ripeness of her age, what had she been when compared with what she now is?" Christian parents of christian children, take to yourselves consolation.

Look up with grateful joy, and weep no more;
To you the precious privilege is given,
Better than adding thousands to your store,
Of adding angels to the host of heaven.

"I wish you could see us in our happy abode, with the profusion of buds and blossoms that surround us; for our house seems positively to laugh in the sunshine, and our children are tractable as frisky little lambkins, all spirits, and yet all gentleness."

Such was the picture of happiness drawn by a maternal pen; such was the language of our buoyant friend. We did see that happy abode, and we did see our exulting friend and correspondent; but a shadow rested on her habitation, and grief was heavy at her heart. We walked with her to a village church yard where they had laid the little one, who was almost as dear to her as the ruddy drops that awakened her heart. Her spirit clung with tenacious grasp to the mouldering tenant of the tomb, and she could not realize the loss she had sustained; the past was to her as a dream. What a wondrous thing is the love of a mother for her child.

There is a grief that sorrows for the dead,
Yet realizes not the loss it grieves;
That cannot learn to think its treasure fled,
And gazes round, and mourns, and disbelieves,
And ever and anon affections strong
Fill up the vacant place that death has made,
With smiling shadows, and the heart is wrung
With unsubstantial hope and fleeting shade.

It is not without pain that we refer to a spectacle we once witnessed. We were present at the vault scene of an Irish funeral, when the apparently distracted parents of the deceased child tore their hair, and beat with their hands upon the coffin-lid of him they were consigning to the grave, calling him back again to his disconsolate friends, with the most intemperate expressions of frantic sorrow. It was an afflicting exhibition of human infirmity. What can be more unchristian-like than such indecorous grief? Is not He who gave us life and liberty to number our days? Are we to make ourselves greater than God, and to reverse his just decrees? How different to this is the language and spirit of Job,—"The Lord gave, and the Lord hath taken away; blessed be the name of the Lord." Job i. 21.

There is a stormy, wild, and frantic grief,
That madly rushes on the heart distress'd;
That seeks not pity, hopes not for relief;
Refuses comfort, and despises rest.
When fierce affection claims a right to rave,
And wild and clamorous desires are given,
That fain would tear the body from the grave,
And pluck the spirit from its home in heaven.

This is a sad state of things, and better it is to humble ourselves under our afflictions than thus to increase them by our unreasonable grief.

The case of a christian widower with two children, supplies us with a strong contrast to the foregoing manifestation of infirmity. The loss of his wife was a heavy loss; and when his first-born followed, he clung with an intensity of affection to his remaining treasure. His surviving child was smitten down by sickness, and for a time life and death trembled in the scale. His trial was severe, for his child died, but his faith failed not. His frame was worn with anxiety, his face pallid with painful emotion, and the sharp arrow of affliction was deeply embedded in his heart; yet not a murmur fell from his lips; but on the contrary, resignation and acquiescence to the will of his heavenly Father were meekly manifested in his words and his deeds.

There is a blessed grief that all transcends;
That knows too well how much has passed away,
Of happiness and bliss; yet meekly bends
And bows submissive o'er its kindred clay;
Chastened and humbled by the trial past,
The bleeding bosom heaves a conscious sig
But Faith is seen to smile amid the blast,
And rebel thoughts and idol passions die.

That such as live only for this world, and no christian hope either for themselves or children, should be overwhelmed with affli under bereavements, can hardly be cause of der; but followers of the Redeemer, though may lament the loss of those dear to them, c sorrow without hope, without denying their tian profession. He that can say, "I know my Redeemer liveth, and that he shall sta the latter day upon the earth; and though my skin worms destroy this body, yet in my shall I see God;" "God will redeem my soul the power of the grave;" and "I know wh have believed, and am persuaded that he is al keep that which I have committed unto against that day," should be ever ready, wi inordinate grief to give up his friends, his c ren, his wife, and himself, into the hands faithful Creator and Redeemer.

Christian! the loss of children may be an the thorns in thy pathway through the world though they may wound thee, yet look unt Lord, and he shall give thee not only patien endure them, but also the strong consolation, hope, and faith, and peace, and heavenly joy

Fatal Peep into Mount Vesuvius.

Some Germans of good family, on a recen casion, had toiled to the summit of Mount Vi vius, and after resting themselves on that sub rous bed, they descended the steep incline to mouth of the crater. There was little smoke day, and the scientific gentlemen began to into danger without being aware of it. guides having had quite enough of soft ashes hard work in the ascent, sat down on the u rim of the crater, not feeling inclined for r exertion. So many people had gone to peep this chimney of the infernal regions, day day, without an accident, that these lazy gu preferred some sour wine and a slice or tw lemon sprinkled over with salt, a very com comestible amongst the lower orders of Nea tans, and a little siesta, to look after the souls bodies of those entrusted to them. One of most adventurous of the Germans, finding he c bear the little sulphur which seemed emitted the crater, resolved to penetrate further; scarcely had he placed his foot upon an appare solid projection, than the whole crumbled ben him, and he was precipitated at least one hund feet. The interior of the crater seems as so the exterior, for the first words heard from unfortunate man were that "he was not hu In vain he tried to extricate himself; what he grasped mouldered in his hand. He could regain his feet—of this his companions al were informed.

They seemed to have become more stup than the unfortunate victim; for instead of patching the guide to the Observatory of Hermitage for ropes or assistance of some k they stood listening to their friend below, gave them the idea of going elsewhere than w they remained useless and spell-bound. The everything in Naples, but what is required; at the Observatory, although ropes must be alw in request, and at least, a precautionary uti yet none could be obtained either there or at Hermitage; and the guides were obliged to g Resina for that which ought always to be at h In the meantime the sulphur began to ope upon the poor fellow in the crater, and he

f gradually sinking, not only in strength, position. With a wonderful self-command x leave of his friends, being perfectly cer- should not survive the natural dilatory f Neapolitans. For two long hours did he e, when his voice got feebler. Perhaps as slow degrees slid deeper into the crater, radually vanished—until the voice was en- ost. An occasional groan was heard, until ne expiration of the above time when all ent. The body was many hours after res- y a guide, who descended two hundred feet he found it. Of course, it was perfectly —the sulphur had suffocated the poor

For "The Friend."

Discrimination in Charity.

proper aid of the poor was one of the first , which claimed the attention of our religious r. Imprisonment of the heads of families, or traint of their property, which was often away by merciless and lawless men, ren- t indispensable that those who were at liberty d the means, should relieve the wants of

No doubt they were soon convinced that age would be taken of this excellent chris- stem of taking care of their own poor, which en maintained by Friends, up to the pre- me. It might in some instances weaken a feeling of independence, and induce idle- nd finally the entire neglect of personal o procure their own subsistence. With re- to the different dispositions, Stephen Crisp following judicious advice :—

concerning practical charity, ye know it is ied by liberality; where liberality ceaseth, waxes cold, yea, so far ceases; where there ontribution, there is no distribution; where e is sparing, the other is sparing; therefore ry one nourish charity in the root, that is, liberal mind, a heart that looks upon the ace that is given him, as really bestowed im as much for the support of charity, as support of his own body. Where people this mind, they will have a care of keeping ay of God's part; for he hath in all ages in singular manner, espoused the cause of the he widow and fatherless, and hath often d by his prophets and ministers, a special upon rich men that had this world's goods, ey should look to it that they were faithful ls of what they possessed, and that they be found in good works, and might not suf- ir hearts so to cleave to uncertain riches, eglect the service God hath given them the of this life for, in a testimony for his name, ommunicate of them to those that were in ty. Concerning the necessities of the poor, s great need of wisdom when ye meet to- about that affair, for the worthiness or un- ness of persons is to be considered in this. ill find some that God hath made poor, and hat have made themselves poor, which must e their several considerations, in which you to labour to be unanimous, and not one to en up with an affection to one person more nother; but every one to love every one in iversal spirit, and then to deal out that love outward manifestations thereof, accord- the measure that the Lord in his wis- working in you, shall measure forth to

hose who, by sickness, lameness, age or im- y, are brought into poverty by the hand of ence, are your peculiar care, and objects l out to you, to bestow your charity upon, them the Lord calls for it; for as the earth is the Lord's, and the fulness thereof, he hath, by his sovereign power, commanded in every dispensation, that a part of what we enjoy from him, should be thus employed. The Israelites were not to reap the corners of their fields, nor to gather the gleanings of the corn nor vintage; it was for the poor. In the time of the gospel, they were to lay by on the first day of the week, a part of what God had blessed them with, for the relief of those that were in necessity; nay, they did not confine themselves in their charity, to their own meetings, but had a universal eye through the whole church of Christ, and upon extraordinary occasions, sent their benevolence to relieve the saints at Jerusalem, in a time of need, and all that keep in the guidance of the same universal spirit, will make it their business to be found in the same practice of charity and good works. To do good and to communicate, saith the apostle, forget not; so they that forget not this christian duty, will find out the poor's part in the corners and gleanings of the profits of their trades and merchandizing; and in the distribution of it, will have a regard to comfort such, who are by the Divine providence of God, put out of a capacity of enjoying those outward comforts of health, and strength, and plenty which others enjoy. For while they are partakers of the same faith, and walk in the way of righteousness with you, submitting themselves patiently to the dispensation of God's providence towards them, they are of your household, and under your care, both to visit and to relieve as members of the one body, of which Christ Jesus is head; and he that giveth to such poor, lendeth to the Lord, and he will repay it.

"But there is another sort of poor, who make themselves poor through their sloth and carelessness, and sometimes by their wilfulness; being heady and high-minded, and taking things in hand that are more than they can manage, and make a flourish for a season, and then through their own neglect, are plunged down into great poverty. These are a sort which the primitive churches began to be troubled with in the early days of the gospel, for the apostle took notice of some that would not work at all, and sharply reproved them, and said, they that would not work should not eat. These are commonly *a sort of busy-bodies, and meddlers with other's matters, while they neglect their own*, and run into a worse way than the unbelievers, while they profess to be believers, yet do not take a due care for those of their own household. The charity that is proper to such, is to give them admonition and reproof, and to convince them of their sloth and negligence; and if they submit to your reproof, and are willing to amend, then care ought to be taken to help them into a way and means to support themselves; and sometimes by a little help in this kind, some have been reclaimed from the snares of their soul's enemy. But if they will not receive your wholesome counsel and admonition, but kick at it, either in their words or actions, Friends will be clear of such in the sight of God; for it is unreasonable in them to expect you should feed them that will not be advised by you, because they break the obligation of society by their disorderly walking; for our communion doth not stand only in frequenting meetings, and hearing Truth preached; but in answering the blessed principle of Truth in life and conversation; and therein both the rich and the poor have fellowship one with another."

Curious Experiment in Botany.

In Sicily there grows a wild grass, which when ripe, at the end of summer, is gathered by the peasantry, tied in bundles, and set on fire; not, however, to be consumed, but for a mere scorching. The flame flies rapidly through the light husks and beard of the plant, and leaves the seeds slightly roasted, in which state they are eaten with considerable relish by numbers of the rural population. What the Sicilians do with their grass might be done with other grasses, and in other countries, were it not that the seeds generally are too small to repay the trouble of producing them for food. If all were but as large as those of the maize, or even wheat and barley, we should hear but few complaints of dear bread. Instances, indeed, are on record of grass-seeds having been largely eaten in times of scarcity, and with the desired effect of sustaining life, for all are more or less floury.

The botanical name of the Sicilian grass above mentioned is *Ægilops*, or goat's eye—the Greeks having believed it to be a remedy for a disease that appears in one corner of the eye. There are three or four species growing all around the Mediterranean, as well as in the islands, chiefly in the hot, dry, sandy plains near the sea. They flourish even on the scorched volcanic soils, in strange contrast to the prevalent aridity, showing the vital principle to be in them unusually energetic, and proof against extremes of heat. Moreover, the *Ægilops ovata*, as though sporting with its powers, shoots out another species, the *Triticoides*, or wheat-like, from one and the same root; not by artificial cultivation, be it understood, but spontaneously. Clearly, these goat-eyes are remarkable plants, and as we shall see presently, they have been experimented on with remarkable results.

M. Fabre, an enlightened agriculturist, of Agde, in the South of France, considering these grasses to belong to the cerealia, began a series of careful experiments on the *Ægilops ovata*, with a view to ascertain what effect would be produced upon it by cultivation. A plot of ground, sheltered by high walls, and sufficiently distant from the fields of grass and other gramina, was prepared, and in this he sowed a few seeds in 1838. The plants grew from twenty to twenty-four inches high, and ripened by the middle of July in the following year; and though with but few fertile spikelets, the yield was in the proportion of *five* to *one*. Here was already a difference, best understood when we remember that in its wild state the *Ægilops* seldom grows higher than from six to nine inches with curved stalks, bearing a small flat rudimentary ear containing one or two grains. The stalks are extremely brittle, and when fully ripe the ears turn black and fall off, like the leaves from a tree. In these latter respects, M. Fabre's crop of 1839 retained its original habit, for the ears were deciduous, and the stalks broke easily; but we see a marked difference in height, and in amount of produce. The seeds were again sown; and in 1840 the spikelets were more numerous, scarcely an ear without two seeds, and these more floury than before, approaching the character of wheat. In 1841, the resemblance to wheat was still more observable; the ears, which were less flat, had from two to three grains, and the awns or beard had almost disappeared. In the next year the plants stood still, being slightly attacked by rust; the number of grains, however, was not diminished. But in 1843 the delay was made up: the stalks grew three feet high, and stronger than in any previous season; the ears could not be easily broken off; the grains were plump: and one of the plants yielded 380 for 1; another, 450 for 1. In 1844, every ear was full, and the grains not so densely coated as before; and in 1845, M. Fabre considered the transformation into wheat (*triticum*) complete: all the plants were true representatives of cultivated wheat.

Here, then, in seven years, we have a change effected by artificial means, which may be regarded as one of the most extraordinary phenomena of cultivation. The brief account we have given the history of the experiments, shows by what a gradual process a wild and comparatively useless grass was converted into one of our most valuable cereals: and more than this, the question as to the origin of wheat may now be considered as settled. Botanists have long repeated the statements, that our cultivated wheat once grew wild in Sicily, Babylonia and Persia; and here we have the explanation. No need now to assume the existence of a distinct variety; and already the first scientific agriculturists of France have come to the conclusion, that cultivated wheat, *tritica*, are only races of *Ægilops*.

Since 1845, M. Fabre has sown the seed, obtained with so much care, in an open field among vineyards by the roadside, and with a return of six or eight fold. The stems are straight and strong; the ears are round and beardless; the grains very floury; and in no single instance has there been any return to the form of the original *Ægilops ovata*. After this, who shall say what may or may not be effected by cultivation? The bearded wheat of Egypt is known to lose its beard when cultivated in England; and in some places the country people have a notion that our own wheat is changed into rye-grass in wet summers. This may be an error; but one thing is certain, that the more wheat is treated as a biennial, the better is the result.—*Chamber's Journal.*

For "The Friend."

Robert Widders was several times stripped of much that was within the reach of the spoilers. But as his sufferings and troubles exceeded those of many others, so also did his christian constancy and valour. Well, might he be called one of the valiants of God's Israel. The nobility, the zeal, the courage, and the resignation of his spirit to the will of God, which in his greatest exercises fully demonstrated his love to the Truth, says T. Camm, hath often affected my spirit; for I never saw him in the least dejected nor concerned, when his cattle, corn and household goods were by wholesale swept away. But he was one that knew well for what he suffered, who enjoyed the sweetness of an eternal reward, in heavenly treasure an hundredfold here, together with the evidence of a crown in eternity. Thus, R. W. had learned to be cheerful and content in the want, as in the abounding of those outward things with which he had been largely endowed, and could, like upright Job, bless God who gave, and who permitted them to be taken away. Frequently, when conversing respecting other Friend's trials, he would say, "It is well with all those that suffer for the cause of Truth; they are blessed; they enjoy peace. There is nothing that hath come, but there hath been need for it, and a service in it; for all our sufferings work together for our good, and the glory of God, and the remainder of wrath will be restrained." During the illness which immediately preceded his death, he was resigned to the will of God, and dwelt on the Lord's mercies to his church, saying, in the language of the prophet: "The Lord shall comfort Zion; he will comfort all her waste places; he will make her wilderness like Eden, and her desert as the garden of the Lord; joy and gladness shall be found therein, thanksgiving and the voice of melody." At another time, in allusion to his own blessed experience, he remarked, "The work of righteousness is peace, and the effect of righteousness, quietness and assurance forever." He would frequently observe, that "his heart was filled with the love of God, and that there was nothing between him and the Lord;" adding, "Thou hast taught me the way of life, and makest me full of joy with thy countenance." Thus his thoughts centred on an enduring inheritance, having fought the good fight, and kept the faith, he could resign the world, its sorrows, persecutions, and joys; and rejoicing in the unclouded prospect which opened before him, say, "Mine eye beholds Jerusalem, a quiet habitation."

For "The Friend."

Early Anti-Slavery Advocates.

RALPH SANDIFORD.

(Continued from page 110.)

Previously to writing the book, Ralph, in his labours with those who held slaves, suffered himself at times to get into the very spirit which has characterized some opposers of slavery in the present day. He bitterly denounced the oppressors. It would appear, indeed, that his deep feeling on this subject had produced partial insanity. He says that he became so darkened in his "understanding that all seemed lost unto me, being swallowed up in it through the violence of the tempest, that the elements which should have been subject, prevailed over me, which put nature out of course, to the defacing of the whole body, that I was as a sign unto you because thereof. Then, as though the rod was on my own back, I suffered with them [the slaves] in the natural body, in which I would vindicate them in such language as proceeded from the exasperation of oppression." His course herein, he says, "I am not about to vindicate, but to acknowledge my infirmities under the provocation, and the Lord's mercies in my deliverance. He knows whereof we are made, and remembers that we are but dust. Though I was as swallowed up in desperation, yet he caused the sea to be still; that I might sing of my deliverances from Egypt's bondage and darkness, and my preservation through the sea."

He apologises in an address to "select Friends," ministers and elders in the Society of Friends, because he had not obtained the concurrence of the meeting with his book, and says that if he could have had it, "it would have been joy" to him. After showing that some who had been begotten into that faith which gives victory over the spots of the world, had so departed from it as to see no harm in slavery, nor even in selling slaves at vendues like beasts, he adds, "It were better we had never known the truth, than afterwards to charge sin on it, as though it admitted such practices." "I leave it to God, the Judge of all, before whom, and the whole host of heaven, the truth thereof will be manifested; and in the interim I have eased my spirit in as soft a stile as I could."

Ralph Sandiford, although not a correct writer, is a strong one, and many passages containing gospel truths in language of considerable beauty, may be found in his book. A part of his preface abridged we will here add, not for its elegance of expression, but for its truthfulness and argument.

"Our Friend, George Fox, in a sermon taken in short-hand as it was preached at a Monthly Meeting in Barbadoes, in the beginning of time, when many were convinced that had slaves, advised them to use them well, to bring them up in the fear and knowledge of God, and after a reasonable service to set them free. This was far from encouraging them to buy more. If they had gone back again into that trade, what had their convincement done for them, but to bring them into greater judgment for their disobedience. Before Friends were a people, many of them were valiant men with the sword, for which they were had in great esteem amongst men, because they [illegible] the nation's deliverance from the oppress[illegible] priests, physicians and lawyers. The one [illegible] a trade of the soul, the next of the body, a[illegible] other of the property. Our Friend, George[illegible] was called forth by the Lord to minister, [illegible] the wisdom of man, for in-that he was unle[illegible] but in the openings of Truth, which mani[illegible] wherein all these were out of the way, an[illegible] by the universal grace all might be resto[illegible] their services, both for the good of soul and [illegible] This caused these worthies to lay down [illegible] swords as unfit for carrying on so great a [illegible] which must be done by a higher power. I[illegible] power they went forth, having the sword [illegible] spirit, which gave them victory over princip[illegible] and powers, and spiritual wickedness in [illegible] places. While Friends stood here, test[illegible] against everything high and lifted up, as ine[illegible] tent with this glorious day, then did the [illegible] prosper,—large meetings were settled herei[illegible] flourished. But in time this dark trade cre[illegible] in amongst us, to the very ministry, because [illegible] profit by it, hath spread over others like a le[illegible] to the grief of the honest-hearted, who are [illegible] strained to sojourn in Mesech, or dwell i[illegible] tents of Kedar, the habitation of blood." A[illegible] we fall short and lay waste the ancient testin[illegible] which was, and is for the bringing down al[illegible] pression and violence, that instead thereof [illegible] lasting righteousness may be established?"

It is probable that Ralph intends to descril[illegible] own state, when he says that slavery tole[illegible] amongst professors of the Truth, had "burc[illegible] the upright, and offended tender seeking [illegible] causing them to dwell alone from all soc[illegible] where this practice is indulged, lest they sh[illegible] have fellowship with that, which contradicts [illegible] gospel of Christ." To the oppressed he [illegible] writes, "In that love that cements the whole [illegible] tion, and beareth all things, I would advis[illegible] brethren, whether Indian, Moor, or tawny sl[illegible] to submit with patience to what our Lord has [illegible] mitted in this world, believing that there i[illegible] eternal region which swallows up this, wherei[illegible] will vindicate his justice. Therefore, for his [illegible] who suffered for us, in whom we may be fre[illegible] deed, and over the heads of our oppressors, [illegible] over our present suffering [let us] cheerfully [illegible] our little time here, fulfil our daily task, and [illegible] the love of those we are under in the land of [illegible] captivity. This will prevent evil words amc[illegible] us, and severity and cruelty towards us."

After expressing his disapprobation of ta[illegible] man's life as a punishment for stealing, and [illegible] gesting that making thieves labour for a livelih[illegible] would be more to the purpose, he goes on to r[illegible] that the mercy of the Most High is manif[illegible] even to the inferior creatures. He quotes [illegible] texts enjoining assistance to be given even to [illegible] enemy's ox or ass, and adds, "Perhaps thou [illegible] say, 'Doth God take care for oxen?' Yes, ve[illegible] the law hath guarded against the hard-hea[illegible] Jews, that it tenderly regards the very birc[illegible] the air. If thou find one of their nests, the [illegible] should not be taken with the young. Though [illegible] of them should be sold for a farthing, yet [illegible] without the Father, unto whom every hair of [illegible] head is numbered. If I abuse one of them, [illegible] it not groan to its Creator, who made it of [illegible] good pleasure, and everything that hath bre[illegible] gives him praise? When he was entreated [illegible] Nineveh, the seat of violence, he had a regar[illegible] the cattle. When Balaam in his anger smote [illegible] ass with a staff, the Lord opened the mouth of [illegible] ass to reprove the wrathful prophet, who cov[illegible] the gain, which the righteous Seed cannot live [illegible] or submit to. A good man, saith Solomo[illegible]

ful to his beast. The beast serves us, and d we not be ungrateful for their service if we not due care of them? The nature and spirit nan may be known by his government over the ior creatures, which the Lord created for his , and the accommodation of man. And should re, in love and thankfulness to him that made , and in gratitude for their service, take care they have food and rest, and what else is con- nt for them? Not only for profit, but from nciple of justice. Should I receive benefits them, and yet be so barbarous as to deny what is necessary, then certainly I have yed from the righteous law of God written on eart. If I should kill or torment any of s creatures, only to satisfy my will, I act un- y, show the tormentor [the devil] to be my er, and the same measure will be mete to me . The creature made not itself, nor was it ed in vain. Neither should we oppress the ion, by coveting to winter more creatures we have provided sufficiently for. Would be doing as we would be done by. Were we g a voyage to sea, would we not lay in store ne worst weather and the longest time? In duty the very bee and ant are instruction to and shall we want wisdom, or neglect to pro- for the creatures under our charge, when our est is bound up therein? Neither should we e their beauty, by cutting off their ears, or r ornaments, which God has given them, ac- ng to his law in nature, for defence from and weather. We go to the very Indies for and umbrellas which are for the same service ." * * * "As man comes to be restored ugh Christ, he acts in that nature which can- exert itself, otherwise than in pure love and erness toward all the creation of God. Were ome to this innocent life, of doing as we would one by throughout all the creation, we could inculcate any principles in our children, that eed from the wrathful nature; then should we h more enjoy ourselves, and they would easily ubdued by love, which governs without a d. The very dumb creatures have a sense of nd are governed by such in peace, not finding er to raise the wrathful nature in them."

alph Sandiford appears to greater advantage is writings, than his more celebrated contem- ry, Benjamin Lay. He evidently writes un- greater care, that he does not violate the t of love and kindness, whilst advocating the ciples of justice, mercy and love. There is cely one page in all his book, which does not ain sound principles of morals, and pure doc- al truth, well worthy to be kept in remem- nce, from generation to generation.

ne more quotation we will give. After stating he that would propagate the gospel by human e, destroys it, he adds, "Let us wait for access he throne of Grace, that we may have admit- ce to the balance of the sanctuary, to weigh e things. Put in thy lordliness and riches, tes founded on oppression, though thou hast t a town with blood, and established a city iniquity, and couldst put in the glory of the le world which passeth away, and then see if ill answer to the loss of eternal riches to thy l, which cost the blood of thy Redeemer. Un- the sense of this, am I thus drawn forth to e. If it should please the Lord, I might be of vice but to one soul, I should be sufficiently mpensed for my thus exposing myself to the sures of men for this labour of love. Groans supplications have been offered up unto the d, night and day, that this trade, with the le train of iniquity attending it, might be pt out of all churches that make mention of thy name. That the knowledge of thee, O Lord, might spread over the Universe,—whom to know is life eternal. That thy gospel may be preached in the true property of it, to the drawing in of souls unto thee. That the light of the moon may be as the sun, and the light of the sun as seven days. That all oppression and violence, that has hindered the progress of thy Truth, may be cen- tred with the author thereof to the pit that is bottomless."

(To be continued.)

From "Frazer's Magazine"

New Metals.

It is not wonderful that the labours of the miner and of the metallurgist have at all times been linked with superstitious associations in the minds of men. The one pursuing his search in the depths of the earth, in darkness and uncertainty, only ministers to the demands of the other for a perpetual supply of those strange stony masses out of which the living metal is drawn; and before chemistry had explained every change which the ore underwent, from its first appearance on the dressing-floor to its fabrication in the hand of the artisan, where, in all the range of art, were trans- formations to be found so complete, mysterious, and astonishing as these? Let any one stand be- fore a blast furnace,—let him wonder at the amount of mingled ore and limetsone and coal that are poured into it by the wagon-load in a constant stream sixty feet above his head, and let him watch the perpetual overflow of *slag*, a veritable lava, which slowly emerges from the bottom of the fur- nace at his side,—and let him await the moment when the rough moulds are ready, and the chan- nel cleared, and the arm of the foreman is bared to give the final blow that is to pierce the wall of clay that supports the molten metal within;— then let him stand by as the luminous flood of iron pours down, true to the channel cut for it, yet as it were resenting the restraint, and momentarily flinging from its surface a myriad stars of fire, un- til it flows tranquilly into each trough impressed in the sand for its reception, and lies in a series of furrows to cool into its well known form of "pig" iron. And this process has been repeated each day without one day's intermission, for it may be thirty years, from that one furnace; and the flames have risen for that period from its mouth, render- ing the midnight air of some wild mountain land of Wales lurid for many a mile, or may have helped to show to the nightly traveller the horrors of that "black country" above Birmingham, from which every earnest visitor will come away with such dark foreboding and such troubled thoughts on the great social problems which it must suggest. How wonderful a process is this by which the con- stant stream of iron into the commerce of the world is maintained in its perpetual flow! Com- pare the lump of heavy clay, or the mass of red or brown dull earthy rock, or of bright iron-gray stone which form the various varieties of iron ore, with the metal that emerges from them; pound, sift, do what you will, with the ore, scrutinize it with the microscope, it is still a stone, no particle of metal can you find there. Examine the metal on the other hand; it has nothing of the earthy in it. Resonant, and bright, and flexible, and strong; whence come these newly gotten powers? They do not reside in the ore, but seem impressed upon its transfigured substance by the will of the opera- tor:—now as "soft-iron," pure and malleable, tough, infusible, bending without fracture, fibrous, and capable of being welded bit to bit, like seal- ing wax, at a sufficient temperature:—now as "cast iron," less pure in its chemical nature from containing carbon (the chemist's charcoal) as a constituent, brittle, sharp in its outline, crystal- line in its structure, readily melted and cast in moulds, breaking but never bending,—how oppo- site are its characters,—yet we may see it again, in the form of steel, assuming nearly all these cha- racters, or surrendering any one of them once more at a moment's notice. For now it shall exhibit in the most exalted degree, brittleness or tough- ness, a brittleness unbending or an elasticity un- rivalled, a hardness adamantine or a softness which yields like brass to the engraver, according as the cunning workman shall impose the one or the other "temper" on its docile substance. And so iron becomes the ready servant that is to work out the vast demands of commerce: it is now the main- spring of our time-pieces and the exquisitely deli- cate regulator of their every vibration; it is no less the sinew and the bone of the iron horse, and the rein that guides him; the skeleton of the bridge with its untiring span, and of the ship whose keel can never strain; at once the impeller and the im- pelled of the automaton machinery by which com- merce moves.

Let us consider another metallurgic process. A furnace is constructed to throw all its heat by reverberation on a mass of lead, and as the metal melts, a current of air is made to play on its sur- face. Soon that surface becomes covered with a molten floating liquid, which flows off from it con- tinually, and will flow so long as any lead remains. The last portions of the lead however are preserved for the silver they contain; the rest has all disap- peared. This floating dross into which the air has converted the lead, hardens as it cools, and forms then a beautiful yellow-orange, unmetallic, highly- crystalline, soft, solid substance—*litharge*. It is the "oxide of lead." It is the air that here, re- versing the dictum of Anaximenes, is the destroy- er. Its oxygen has combined with the melted metal. It needs not to melt iron to produce an analogous effect. If the bar of refined iron be but left in neglect to the rude influences of the weath- er, to air and moisture, it will soon be seen that the metal, with all its stern qualities, is like man himself, dependent on certain conditions and cir- cumstances, which must be ever supplied and pre- served around it, or the bright shall tarnish, the strong fret away into weakness, and the lustrous and the elastic, the stern to labour and the patient to endure, shall suffer corrosion, and become a dull insipid earth, a mere heap of rust. Yet from this earth, this oxide of iron, no less than from the dross of lead, the metal may be again recovered. The earth or calx is in either instance formed by a union of the metal with the oxygen of the air, and any substance with a stronger tendency to com- bine with that oxygen will free the metal of it, and the iron or the lead may be restored to their me- tallic form of existence. Carbon, that is coal or charcoal, effects this, and the operation is similar in result whether it be performed in the blast-fur- nace whose weekly product is above a hundred tons of iron, or in the reverberatory furnace wherein lead is reduced to the form in which we use it.

It was this singular conversion of a metal into an earthy calx, and this inversion of the phenom- enon by the reconversion of the earth into the metal, that incited the alchemist to perpetual ex- periments, from the days of Geber to those of Beecher. Was there in fact anything contradic tory or absurd in the belief that the crucibles of Albert the Great, of Raymond Lulle, or of Arnold, had yielded gold when gold had been absent as an ingredient from the conditions of the experiment? Did not a mere calx, when mixed with charcoal, yield lead? Did not the very metal of silver, Luna herself, emerge from ores in which no silver could be seen? nay, did not even the Saturnine

ores—did not the stones which yielded lead, yield, too, their small quota of this queenly silver? If Luna could thus emerge from the region of Saturn—if the ores of copper when mingled with calamine produced not copper, the Venus of the metal-firmament, but brass,—if bronze sprang from the conjunction of Venus and Jupiter, and the copper and the tin lost each their characters in the bronze they formed, why should not the addition of some subtle redder mercury give to tin the properties of gold, or teach the alchemist to transmute the dross of Saturn or the charms of Venus into the glories of Sol, the golden metal-king?

(To be concluded.)

Report of the Managers of the Howard Institution, for the Reformation of Discharged Female Prisoners.

The members of "The Female Prison Association of Friends," having felt the need for a number of years, of a suitable asylum or shelter, for such discharged female prisoners as really wished to reform their lives, but who, being destitute of respectable relatives or friends, were induced to return to their former evil haunts and wicked companions, and thus, drawn deeper and deeper into the vortex of iniquity, found themselves again and again the tenants of the dreary cell.

Accordingly after due deliberation thereupon by those interested in the prisoners' welfare, and several individuals having kindly offered to assist in furnishing the requisite means to carry out the design, it was concluded to try the experiment for one year; accordingly a house was rented for the sum of $275 per annum, situate on Spring Garden street below Twelfth; the services of Mary Murray were engaged as matron, and the Institution opened on the 1st day of Ninth mo., (September,) 1853. This location not being very desirable on some accounts, it was thought best to select a more retired situation, and accordingly in the Third month, (March,) following, another house was taken (our present location) situate on Poplar street, four doors west of Sixteenth street, at a rent of $300 per annum, and the inmates removed thither with as little delay as possible.

Our plan is, to board and clothe for a term of from three to six months, and not usually less than two months, such discharged female prisoners, as may seem from time to time, to the Committee, to be sincerely desirous of amending their lives, and by endeavoring to surround them with the right influences, preparing the way, by this short period of probation, a little to test their desires for a return to respectability, and an honest calling,—or, as it may be termed, a stepping stone between a prison and virtuous life.

Since the opening of the Institution, in the Ninth month, 1853, fifty women have been admitted; of this number, situations in the country have been procured for nineteen, from most of whose employers, we have received at different times, satisfactory accounts; as also occasional letters, expressive of much gratitude from the objects of our care and solicitude themselves; and although we feel to have nothing to boast of, being well assured, that "except the Lord build the house, they labour in vain that build it;" yet are we at times cheered and encouraged to hope, by the industry and general good conduct of the inmates of "the Howard Institution," that the care and labour bestowed upon them, will not be wholly in vain.

The women are chiefly employed in plain sewing and quilting, which they execute generally in a creditable manner, under the superintendence of our Assistant Matron, Catharine Horn, who also devotes a portion of the evenings to instructing them in reading and writing.

Our Matron, Mary Murray, continues to discharge her duties with fidelity, and we believe has the best welfare of these poor erring ones much at heart.

To those kind friends, through whose liberality we have been enabled to commence and carry out this Institution to the present time, we would respectfully appeal, and ask them (as well as other benevolent disposed individuals,) if the concern shall be suffered to languish, or whether it is likely, the requisite means will be placed at the disposal of the Managers, so as enable them still to continue its benefits.

Contributions either in money, clothing, provisions or articles of furniture, will be thankfully received at the Institution, Poplar street, four doors west of Sixteenth, or by our Treasurer, Sarah E. Wistar, No. 133 Filbert street.

If thou receivest an injury from any man, remember there are two things in it, viz., the sin of him who does it, and the suffering which is inflicted on thyself. The sin is against the will of God, and it greatly displeases Him though he permits it. But the suffering which thou art called to endure, is not in opposition to his will. But on the contrary, he wills it for thy good. Wherefore thou oughtest to receive it as from His hand.—*Molinos.*

A correspondent of the Providence Journal, writing from Rome, says:

"The government allows several pounds of snuff a year to each priest, and so the habit of snuff-taking is as common among them as is the habit of tobacco-chewing among Americans. I have repeatedly seen a priest take a pinch of snuff as he was kneeling before the altar, and offer it also to the one by his side. I have seen in the elegant church of St. Eustache in Paris, and often in the churches of Rome, before a congregation of polite people, a priest, as he was about to commence his discourse from the pulpit, fill his nose with large quantities of snuff. And last, I have seen the Pope, before the high altar of St. Peter, take snuff as the host was about to be raised by the officiating priest! This might shock the propriety of some among us, but in Europe it is a thing so common as not to excite any surprise."

THE FRIEND.

SECOND MONTH 2, 1856.

In the last number but one we quoted from the "Life of J. J. Gurney," the charge which his biographer makes against those Friends who have borne testimony against some parts of his writings, evidently intended to apply to those who were instrumental in preparing the "Appeal for the Ancient Doctrines," and consequently to the Yearly Meetings which sanctioned and issued it. Often as this charge of unfairness and misconstruction has been preferred, we are not aware that any one has attempted to show that the passages quoted as unsound are not fairly taken, that the meaning attached to them by those objecting to their import is not correct, or that the contest exhibits them in a different point of view from that in which they are presented.

Every one can read and examine for himself whether they do not fully convey the meaning attributed to them in the "Appeal," and whether the views declared in it to be unsound, are not those which the author, *at the time*, was desirous to inculcate; and likewise, whether those views are not incompatible with the faith of the religious Society of Friends, as set forth by its approved writers, in the quotations from their works pl in juxtaposition with the former. Such an ir tigation, uninfluenced by the prejudice of p spirit, and unawed by the fear of man, cannot think, result otherwise than in bringing home conviction, whether it is acknowledged or that the words of the "Appeal" are true wher says, "the passages here brought together, tain sentiments in many respects at variance those held by our ancient Friends, and als professed by our religious Society." "Brief marks on Impartiality in the interpretation Scripture," published in this country (fro copy sent from England) in order to sh how far Friends had departed from their origi faith, was written by J. J. G., for the expr purpose of proving that certain views, or as characterizes one of the most important ticles of our faith, "peculiar notions" prou gated by primitive Friends, whom he designa as "certain persons under our name," are sound; and, at the same time, to inculcate own, as he no doubt believed, more corr exposition of doctrine. It is an elaborate tempt to show unsoundness in certain import points insisted on by G. Fox, Robt. Barclay, J Phipps, and we may say the whole body of t early Friends, and to point out the dangerous co sequences resulting, as he supposed, from th adoption. These alleged errors of the ea Friends are ascribed by him to a misunderstandi of certain Scripture texts, and to what his biog pher, we suppose, would style, "an unhapp mistaken process of reasoning;" and views, su as the Society has never approved, are given corrections, or as the doctrines which J. J. G. b lieved to be in accordance with Scripture.

Now we ask any sincere, candid member of o religious Society who is acquainted with its fait whether these supposed corrections are not imp tant departures from that faith? and does t reading of this production, "in the spirit in whi it was written, and with that simplicity of pu pose in which alone the truth can be perceiv and apprehended," furnish, as the biographer a serts, "a sufficient answer to the charge" whic has been brought against it? Are the doctrin promulgated by such men as those whose nam we have mentioned,—who were the apostles Quakerism, and whose attainments in the scho of Christ placed them far above the range of mer biblical criticism,—and which doctrines have ev been maintained as portions of the faith of our r ligious Society, to be thus attacked by a membe be his station what it may, and the Church to b debarred from publicly rebutting the attack, an defending its faith and its faithful servants? an is it right and proper that the efforts made fo this purpose should be stigmatized as springin from ignorance and prejudice, and as "productiv of consequences which the lover of truth coul not fail to deplore"?

Look again at the other points brought int view from his other works, and see if there is no indisputable evidence accompanying the extract given in relation thereto, that it was the intentio and desire of the author when penning the portio of his works from which they are taken, to urg opinions, which the Society of Friends has a ways repudiated. The various quotations mad upon the cardinal doctrine of a universal savin light communicated to all mankind, show a grea want of clearness in this important particular, an exemplify the natural consequence of unduly ex alting the Scriptures, in practically diminishin the importance and necessity of the immediat guidance of the Holy Spirit, independent of thos precious records. We need not particularize th

ent points, for upon all that are alluded to
he "Appeal," we feel confident no fair
nce can be adduced of any thing having
omitted or added which would give any
meaning to the parts quoted than that
n they convey as they stand thus isolated;
re are unwilling to believe that any candid
d, knowing what the faith is that he pro-
s, will deny that "they contain sentiments in
respects at variance with those held by our
nt Friends, and always professed by our re-
is Society." The truth of this is so apparent
the biographer, notwithstanding his grave
unfounded charge, is obliged to admit it,
gh in so doing he employs the softened phrase
ere being passages "open to misconception,
which, especially when isolated and detached
the context, may be, perhaps justly, liable
ne exception."

t it is said to be "by an unhappily mistaken
ss of reasoning and criticism that an attempt
been made, with a zeal worthy of a better
, to prove that he (J. J. G.) was opposed to
great principles of Spiritual Christianity
h have ever distinguished the Society of
nds." The statement here made of the object
d at by those who have felt bound to bear
mony against the unsound views of this pro-
vriter, and which led to the preparation and
g of the "Appeal," is as erroneous as the
which would prompt an individual to ad-
e such a sentiment involving a charge against
arge Yearly Meetings is uncharitable, and may
ot say self-sufficient. While in the discharge
religious duty, it was found necessary to point
many of the dangerous errors contained in the
s, and to strive to prevent them from becom-
rafted on the faith of the Society, nothing is
respecting *the author* being "opposed to those
principles of Spiritual Christianity." He
declared his faith himself in the works he had
orth, and they left him to be judged by them,
ng, while they testified against parts of those
s which were unsound, that, "in various
s Christian doctrine is supported on Scriptu-
round." How far their labours are the result
"unhappily mistaken process of reasoning
riticism," remains yet to be shown. Surely
ne who is capable of appreciating the effects
life of godliness and devotion to the cause of
st, will believe it was from such a process of
ning and criticism that so many of the pillars
he Church militant, who within a few years
been gathered into the Church triumphant,
led to bear public testimony against those
s, to call on their fellow members to rally
rst principles and earnestly contend for
ancient faith of the Society; nor is it
e supposed that the concern of Ohio and
adelphia Yearly Meetings could have sprung
a source so shallow, when, after speak-
of the necessity "for all those who are
ous of seeing the waste places built up and
former paths restored, to put shoulder to
lder, and labour harmoniously in the great
of our day," they declare "it is from a fer-
desire to be found thus engaged in the Lord's
, and from *no wish to cast censure upon indi-
als*, that we have felt ourselves constrained to
e the preceding exposition."

ith the evidence afforded by the "Appeal,"
his own admission, it is difficult to understand
the biographer could allege that the same
se which has been pursued with the writings
J. G., "applied to the writings of the early
nds, to those of the first reformers, or even to
Holy Scriptures themselves, would be produc-
of consequences which the lover of truth
could not fail to deplore." Such an assertion, so far as it relates to the writings of our early Friends, must, we apprehend, have been used either without due consideration of its import, or from ignorance of those writings, for it certainly has no foundation in truth. As regards the writings of the first reformers, it is true that the same course would exhibit many similar discrepancies between their views and the more pure and spiritual doctrines of our religious Society, and R. Barclay, in his apology, has taken extracts from the works of those worthy men, in the same manner as the extracts from the works of J. J. G. are taken in the "Appeal," and in the same way shown that they convey sentiments incompatible with pure christianity; but we should suppose no true Friend would imagine his course "productive of consequences which the lover of truth could not fail to deplore."

The "Life of J. J. Gurney," carefully as it has been compiled so as to exclude every thing which was thought might not exhibit him as a consistent Friend, affords an insight into his character, that we think explains the inconsistencies to be found in his writings. It shows him to have been a man of amiable disposition, of generous impulses, and an expansive benevolence, with a mind of medium powers, well cultivated by a collegiate education, but lacking originality, and peculiarly impressible by surrounding influences. Early training and associations imprinted on his mind the doctrines of the National Church in reference to the plan and means of salvation, and his continued social intercourse with members of that denomination in his family circle, and with many occupying conspicuous stations as its ministers, as well as with others differing from it mainly in their views on church government, together with his course of reading and study, kept up, if it did not strengthen those impressions; so that no subsequent change in his religious views and feelings went deep enough to obliterate them in all the points where they differ from the more simple and spiritual profession of Friends. His disquisitions on divine things bear marks of their uncertain origin, and hence his Quakerism, which he says, because of their defects he would not define "as the system so elaborately wrought out by a Barclay, or as the doctrines and maxims of a Penn, or as the deep and refined views of a Penington," naturally succumbs, again and again, to his original and long practised habits of thought and reasoning.

The men whose definition of Quakerism he rejects, had also been early trained in views differing widely from those they afterwards promulgated, but in the thorough change wrought in them, comparable to breaking up the fountains of the great deep, *all* old things were done away, and their faith, begotten and perfected through the immediate operation of the Holy Spirit in the heart, was complete in all its parts, without inconsistency or contradiction, and in strict accordance with the Holy Scriptures.

The efforts of the biographer and others, to pass the works of J J. G. down to posterity with the reputation of being true expositions of Quakerism, imply a determination to sustain his doctrines, be the consequences what they may. But we trust they will yet pause and consider what incalculable mischief and distress have been brought upon the Society everywhere by the promulgation of the doctrines adverse to its faith. None can fully estimate the suffering it has produced,—Friends arrayed one against another; on the one side to support a man of high social position and popular influence, on the other to guard the Society from being carried off from its original ground by a conscientious effort to resist and reject the doctrinal errors he has published to the world. Confidence in one another has thus been greatly impaired, sincere love and fellowship very much broken up, and the unity of the Spirit in which the strength of a religious society mainly consists, seems to be regarded by too many as hardly needful to be sought for. What benefit ever has or ever can accrue to the Society of Friends from attempts to modify or reform its principles or its church organization? They have been established in the wisdom of Christ, and all such attempts have proved vain from the days of Perot and Keith, of Wilkinson and Story, to the present time. The restless or superficial, who may have been beguiled into such schemes, have been separated from their best friends, and landed in darkness and difficulty. True Quakers hold no other religious principles than those preached by our blessed Lord and his apostles. The early Friends were enlightened by the Holy Spirit to understand those principles, to promulgate and practise them, and those who strive to lay them waste, must fall away from the life and preserving power of Truth, and become involved in confusion. But we believe there are yet many living members of the Church of Christ scattered throughout the Society every where, who will be kept by his power earnestly wrestling for his blessing on themselves and on it, and enabled to bring forth fruit to his praise and to the maintenance of a pure faith and the restoration of right order amongst us.

The Managers of the "Home for the Moral Reform of destitute Coloured Children," acknowledge the receipt of ten dollars from a Friend in Colerain, Ohio, at least so post-marked, bearing date Eleventh month 24, 1855. And also five dollars for the same object, from a few Friends, "some of it from the children," in the neighbourhood of Harrisonville, Harrison Co., Ohio, enclosed in a note dated First mo. 26, 1856, which donations are very acceptable.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to First mo. 12th. The English funds continued to decline. Consols on the 11th were quoted at 86¼ a 86⅝. The Bank returns for the week were unsatisfactory. The monthly returns of the Bank of France were also unfavourable. The decrease in the bullion in the Bank of England, was £283,000, and that of the Bank of France had diminished £772,000 in the month. Cotton had declined from ⅛ to ¼d. with sales of 44,000 bales during the week. Flour was in better demand, and prices had advanced 1s. per bbl. The range was from 42s. to 44s.

The War.—Advices from the Crimea state that the Russians have increased their fortifications over Inkermann, and have unmasked new batteries on the left of the Chernaya. No injury was received by the ships of war in the late storm. The threatened destruction of the celebrated docks of Sebastopol has commenced. One of them was demolished by the French engineers on the 22d of Twelfth month; its destruction was fully accomplished, the blast having reduced the massive fabric into a ruined and confused heap of stones. The remaining four docks are to share the same fate, as soon as the needful mining operations can be completed. These docks were constructed by the Russian government at immense cost. A part of the Russian troops in the Crimea had been ordered to reinforce Gen. Mourarieff in Asia. The Turkish army under Omar Pacha remained in Redoubt Kale shut up there by the winter and the Russians. His army was not well supplied with provisions. The Council of War at Constantinople was directing all its efforts to the defence of Erzeroum and Trebizonde. The railway from Moscow to St. Petersburg is to be protected by redoubts placed at intervals along the line. Each redoubt is to be occupied by a battalion of militia, who are to be responsible for the line within their limits, to the extent of guarding it against any surprise by the enemy. The price of saltpetre has risen exceedingly in Russia. Richard Cobden has published a new peace pamphlet. The popular feel-

ing in England continued to be warlike. It is said to be less so in France. A despatch from Berlin of the 10th says, that "England has taken a very high tone towards the Prussian government, threatening to blockade the Prussian ports. The cabinet is becoming alarmed, and strong efforts will be made to induce Russia to accede to the terms proposed." The alliance between Spain and Great Britain and France, has been formally consummated, Spain binding herself to send into the field from ten to twenty thousand men in the spring, and her interests, particularly Cuba, to be protected by France and England.

DENMARK.—Denmark has announced her continued neutrality, and disavows any connection with the Swedish alliance. The Sound Dues Conference, which was to have opened at Copenhagen on the 2d, has been indefinitely postponed. The government is said to be much embarrassed as to the course to be pursued towards the flag of the United States, on its first attempting to pass duty free after the expiration of the present treaty.

JAPAN.—The treaty with this country is attended with some difficulties, the American ship masters and the Japanese authorities not understanding its provisions alike. It is stated that a fleet of twelve American whalers recently visited Simoda, in anticipation of receiving supplies. The report is, that they were treated very unkindly, and a determination was made by the Japanese from some cause, not to furnish them with any. The Americans then took what they wanted, and paid in dollars at their fair weight. It is said that guns had been fired, and Japanese killed. The Friend of China of Eleventh mo. 12th, has the following:—"We learn by the Tartar, that the day after the Japanese convention (British) was ratified at Nagasaki, Admiral Sterling was aided by the commissioner to give his advice on the best course to be pursued towards the Americans, who, it was said, with nine vessels at Simoda, were breaking the peace in the most outrageous manner. The Admiral is reported to have recommended concession to the American demands, provided they were in any way reasonable."

HAYTI.—Recent advices confirm the report of the complete defeat of the Emperor Faustin, in his expedition against the eastern side of the Island. His army was totally routed with the loss of many of his best officers, all his munitions of war, and the Emperor's military chest containing the funds for the war. Faustin's place of refuge was unknown, and Gen. Santander had offered a reward of 10,000 doubloons for his head.

CENTRAL AMERICA.—A recent arrival from Truxillo, Honduras, brings a report that General Cabana, the former President, who had lately joined Gen. Walker, was on the frontier with 400 Americans and 1000 native troops, for the purpose of wresting the country from Guardiola. It was supposed he would succeed. The natives generally were favourably disposed to Walker whose forces were receiving accessions by every steamer.

UNITED STATES.—*Congress.*—During the last week the voting for Speaker continued in the House of Representatives, with no better results than heretofore. Richardson having declined being any longer a candidate, the democratic vote has been transferred to James L. Orr, of S. C. Fuller also withdrew, but a number of his friends continued to vote for him. On the 26th, the following resolution was adopted by a vote of 108 to 93. Resolved, That, in the opinion of this House, the repeal of the Missouri Compromise of 1820, prohibiting slavery north of latitude 36 deg. 30 min., was an example of useless and factious agitation of the slavery question, unwise and unjust to the American people. Another resolution declaring that the restriction contained in the Missouri Compromise ought to be restored, was adopted by a vote of 101 to 100. On the 28th, a resolution for the election of Speaker by a plurality vote, was again offered. It was laid on the table by a vote of 106 to 100.

Kansas.—On the 24th ult., the President sent a special message to Congress on the affairs of Kansas. In the Senate it was referred to the Committee on Territories. In the House it was read and laid on the table. The proceedings of the Free State party in the territory are denounced in the message as revolutionary and disorganizing, and Gov. Reeder is censured severely for his negligence and mal-administration. The President considers that the peace not only of Kansas, but of the Union, is seriously threatened. He says, if the opposition to the constitutional authorities of Kansas takes the form of an organized resistance, it will lead to treasonable insurrection, and must be suppressed by the Federal Government. He concludes by saying, that if the inhabitants of Kansas shall desire a State formation, and be of sufficient numbers, the proper course would be a convention of delegates to prepare a constitution, and recommends the enactment of a law to that effect, in order for its admission into the Union in a lawful and proper manner, and a special appropriation be made to defray any expenses which may become requisite in the execution of the laws, or in maintaining public order in that territory. He does not allude to the well-known fact, that this trouble has all grown out of the repeal of the Missouri Compromise.

Pennsylvania.—The Judiciary Committee of the House of Representatives have made a written report affirming the right of citizens of the south to transit through Pennsylvania with their slaves. A minority report denying such right, was also presented. A bill has been introduced into the House, providing that the action for damages commenced by Passmore Williamson against Judge Kane, shall be removed from the Court of Delaware County to the Supreme Court of Pennsylvania sitting at Nisi Prius, in and for Philadelphia. The bill repealing the Restraining Liquor Law of last session, has passed by a vote of 69 to 25. The bill has gone to the Senate, and been referred to its Committee on Vice and Immorality. The general expectation is, that a majority of the members of that body are disinclined to repeal the existing law, without first devising a substitute for it. The supplement to the charter of the Philadelphia and Baltimore Central Railroad Company, authorizes them to borrow $1,500,000, to construct and equip their road at seven per cent. interest, and issue bonds therefor, secured upon that part of the road located in Pennsylvania.

Philadelphia.—Mortality last week, 207; of small-pox, 22. The total receipts into the city treasury during the year 1855, amounted to $5,174,969. Large as this sum is it was insufficient for the demands upon the treasury, and the finances of the city are greatly embarrassed. The Delaware river is closed by ice. The ice houses upon the Schuylkill have been filled with ice, a foot in thickness.

New York.—Mortality last week, 375. The harbour and the North and East Rivers are filled with huge masses of ice. The communication between the ocean or New Jersey is kept up by powerful ice boats and steam tugs.

Miscellaneous.—Senator from Mississippi. — Jefferson Davis, now Secretary of War, has been elected to the U. S. Senate.

Cost of Fences in the United States.—Burknap, a well-known agricultural writer, in speaking of the cost of construction and repair of the common fences which separate the fields from each other, and from the highways, says:—"No man dreams that when compared with the outlay for those unpretending monuments of art, cities and our towns, with all their wealth, are left far behind." All the specie in the country would probably go but a little way in paying for the needful fencing.

Deep Snow.—A great quantity of snow has recently fallen in the western part of New York. It is thought to average, throughout the State, from two to four feet. In Chautauque county the snow is said to be three feet on a level, and in Lewis county about four and a half feet.

Revolution in Monte Video.—A revolution broke out in Monte Video on the 25th of Eleventh month, and for four days that city was the scene of a war. Between 90 and 100 persons were killed, and a much larger number wounded. On the 29th, order was restored, and 123 persons belonging to the revolutionary party, embarked for Buenos Ayres.

The Hong Kong Affair.—The arrest of Capt. Nichols, of the American ship Reindeer, by the British authorities, appears to have warmly excited the American residents at that place. Capt. Nichols did not pay the fine imposed upon him. It was paid by one of the owners of the Reindeer, against the wishes of the captain and the United States Consul.

The Sugar Crop in Texas, this season, has been unusually large. The crop in Brazoria county is estimated at $500,000.

The Weather at Niagara.—An ice bridge, above Niagara Falls, connecting with Goat Island and Canada Shore, has been safely travelled by pedestrains the past week. Such a thing has not happened before for 25 years.

The Legislature of New York, has passed a law that no religious or benevolent society shall receive any bequest or devise, the annual income of which is over $10,000, and it must have been made at least two months before the death of the testator. In no case shall the bequest be more than one fourth of the estate.

Heavy Damage by Ice.—The destruction of pine timber in North and South Carolina, by the accumulation of ice on the trees, has been very great. The papers of that section speak of it as causing a very heavy lo property.

The Boot and Shoe Trade, in Essex county, Mass., ploys 15,105 males and 19,395 females. The numb pairs made annually, is 21,540,000.

Wrecks at Key West in 1855.—Eighty vessels v wrecked on the Forida Reefs, or arrived at Key We distress last year. The vessels and cargoes were va at $2,844,000. The total expenses were small, o to the well directed exertions of the wreckers; t amounted to $89,415; salvage, $100,495; loss, $4 300.

Expulsion of a Newspaper Correspondent.—Russell, Crimean correspondent of the London Times, who given such vivid pictures of the condition of the a in that quarter, has been mobbed and driven out of Crimea, by the soldiers, for speaking of the debauch and drunkenness which prevail in the English Cam

A Profitable Voyage.—A few months since a ship ed from New York for Australia, with a cargo mo of flour. It cost in New York about $10 per bbl., was sold immediately on arrival, for $25. The s ship went from thence to Calcutta, took in a carg saltpetre, &c., for New York. The net profits of voyage were about $110,000.

RECEIPTS.

Received from S. Hobson, agt., O., for Thos. Emm $2, vol. 29; from John Curtis, Cin., O., $2, vol. from Asa Raley, O., $3, to 52, vol. 28; from J. Ki agt., N. Y., for J. Leffingwell, $2, vol. 29, for A. Ki $2, for B. Fra; from C. Bracken, agt., O., for J. Wri and Saml. Russel, $2 each, vol. 29; from Richard H per A. Dirkin, Eng., 10s., vol. 29.

FRIENDS' BOARDING-SCHOOL AT WEST-TOW

The Winter Session of the School will close on Sixt day, the 4th of Fourth month, and the Summer Sessi will commence on Second-day, the 12th of Fifth mon next.

Those members of Philadelphia Yearly Meeting, w intend sending children to the school for the summ session, will please make application for their admissi on or before the 1st of Third month, to Joseph Sno don, Superintendent at the school, or to Joseph Sc tergood, Treasurer, No. 84 Arch street, Philadelph The parents of those children now in the school, w also please notify the Superintendent whether they w to return next session.

West-town, First mo. 28th, 1856.

The Original and Present State of Man. By Joseph Phip

A new Stereotype Edition of this work is now co pleted, and for sale at Friends' Book Store, 84 A street.

Friends' Boarding-School for Indian Children, at Tunessassah.

Two women Friends are wanted at this Institution assist in the family.

Also, a man Friend to aid in carrying out the co cern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTON

e Patent-office Report for 1853 contains a
ir on the Striped Gopher, by Dr. P. R. Koy,
cine.

says, it is found abundantly throughout most
e ravines and oak openings in Wisconsin and Northern Illinois, and in many parts of Iowa.

"For the last seven or eight years, I have made the habits of this interesting little animal a special study. Some years since, a lad announced to me that he had brought me a pair of striped gophers, two deer mice, and some two or three meadow mice, all of which he had in a box together. He had also two flying squirrels, tied up in a sack. On opening the box, to my surprise, and the boys' great disappointment, we found no mice. It was impossible for them to have escaped; what had become of them? On a closer examination we found a part of the skins of the mice. The gophers had dined on them! Here, there was something new. I then put the gophers and the flying squirrels into one cage, and in less than two hours, I found that they too had been massacred, and their brains eaten out by the blood-thirsty little gophers.

"This accidental circumstance led me with renewed interest to experiment and closely watch the habits of this much abused friend of the agriculturist. This striped spermophile is decidedly the most carnivorous hibernating rodent of which I have any knowledge. When a squirrel or other small animal is put into a cage with one of these, it will in a moment be all animation and activity, darting at the intruder, inflicting a wound, and flying back with such rapidity as to leave but little chance for defence. As soon as it has disabled its antagonist, it seizes it by the back of the neck, and kills it. During these combats, the gopher utters a low snarling growl, and emits a musteline odour. After killing their prey, they remove the upper part of the skull, suck the blood, and eat out the brains. The carcass is then devoured as occasion requires; but if an abundant supply is at hand, they only eat the brains, resembling in this respect the weasel. So strong is their appetite for flesh, that the female will kill and eat her own offspring if animal food cannot otherwise be obtained.

"Our little animals lay up no winter store of provisions, but retire to their burrows by the first of November, and there remain perfectly torpid until the frost is quite out of the ground in the spring. The adult animals utter a shrill chatter when alarmed, and glide through the grass with such celerity as to elude pursuit. They feed upon wheat, rye, oats, barley and Indian corn, but prefer grasshoppers and mice to either, and not unfrequently eat snakes and young birds. They never eat any kind of roots, fruits nor green vegetables; never cut down, nor gnaw young trees. The only injury I know them to do the farmers, is pulling out a little newly planted corn in the spring, and for this one offence they are condemned without mercy, without inquiring whether they do not subserve some useful purpose in the economy of nature which more than compensates for the damage done to the corn crop. I am satisfied that when the case of 'benefits versus injuries' is properly investigated, the agricultural interests will promptly decide that the 'striped spermophile' is an advantage to the country, and deserving protection rather than destruction from the hands of the farmers. They keep in check the meadow mice and other small quadrupeds. Ground squirrels cannot inhabit the same locality. I have one case in point. Mr. Taws, an energetic and intelligent farmer of this county, (Racine), bid up a liberal premium for all striped gophers killed on his premises; and so successful were his efforts to exterminate them, that in one or two years, not one was to be found on his farm, where they were formerly abundant; but, as the gopher diminished, the meadow mice increased, and in two or three years he found his farm infested with these to such an extent as to be highly injurious. His stocks of grain and hay were cut and greatly damaged; his fruit trees girdled and barked; his potatoes eaten in the hill, &c. Mr. Taws was unable to account for the circumstance of his farm being the only one in the neighbourhood, where the mice were at all troublesome. However, when I acquainted him with the habits of the striped gophers, he was no longer in doubt as to the true cause. He went home, and forbade a gopher being killed on his premises, and invited back as friends, what he had before persecuted as enemies; and now on his farm the mice are rapidly diminishing, and will soon be harmless."

Epistle of George Fox.

Dear Friends and Brethren,—Who are turned from darkness to light, and from the power of Satan to God, who are believers in the light, which is the life in Christ, and are become children of the light and of the day;—who are grafted into Christ, the second Adam, the Lord from heaven, and are gathered in the name of Jesus, in whom ye have salvation, and not in any other name under the whole heaven. For Christ Jesus saith, "Where two or three are gathered together in my name, there am I in the midst of them." Matt. xviii. 20. So you being gathered in the name of Jesus, he is in the midst of you, a Saviour, a Mediator, a Prophet, a Shepherd, a Bishop, a Leader, a Counsellor, the Captain of your salvation, who bruises the serpent's head, and destroys the devil and his works. Therefore, brethren in Christ Jesus, exhort one another daily, while it is called to-day, lest any of you be hardened through the deceitfulness of sin. For you are made partakers of Christ, if ye hold fast the beginning of your confidence steadfast to the end. Heb. iii. 14. Therefore, hear Christ's voice, for he is in the midst of you, a teacher. Take heed lest there be in any of you an evil heart of unbelief, in departing from the living God, as there is in too many in this day of provocation and temptation. While it is to-day, hear his voice, and let us consider one another to provoke unto love and to good works. Let us hold fast the profession of our faith without wavering, (for he is faithful that hath promised and hath called you,) not forsaking the assembling of ourselves together, as the manner of some is; (mark,) as the manner of some is, that did and do forsake the assembling of themselves together, but exhorting one another: and so much the more as you see the day of light appearing. For, if we sin wilfully, after we have received the knowledge of the truth, there remains no more sacrifice for sins; but a certain fearful looking for of judgment and fiery indignation, which shall de-

vour the adversaries. Heb. x. And therefore it is good not to forsake the assembling of ourselves together, but exhort one another daily; for Christ is in the midst of his people a teacher and a prophet, who saith, "Learn of me the way, the truth, and the life." We being many, are one body in Christ, gathered in his name, and every one members one of another. Having then gifts differing according to the grace that is given us, whether they be prophecy, let us prophesy according to the proportion of faith; and let those that minister, wait on their ministry; those that be teachers, on their teaching, and he that exhorteth on exhortation; he that giveth, let him do it with simplicity; and he that ruleth with diligence; and he that showeth mercy, is to do it with cheerfulness. Abhor that which is evil; cleave to that which is good. Be kindly affectioned one towards another with brotherly love; in honour preferring one another. Rejoice in hope; be patient in tribulations; be not overcome with evil, but overcome evil with good; and if it be possible, as much as lieth in you, live peaceably with all men. Rom. xii. This is and was the practice of the church of Christ. And now the God of hope fill you with all joy and peace in believing, that ye may abound in hope, through the power of the Holy Ghost. I myself, also am persuaded of you, my brethren, that ye also are full of goodness, filled with all knowledge, and are able also to admonish one another. Rom. xv., 13, 14. Here the church of Christ, in which he was in the midst, a teacher and the head of the church, were and are able, through him, to admonish one another. Let the peace of God rule in your hearts, to which ye are also called into one body, to wit, of Christ. Let the word of Christ dwell in you richly in all wisdom; teaching and admonishing one another, &c. Col. iii. Whatsoever ye do in word or deed, do all in the name of the Lord Jesus Christ, giving thanks to God and the Father by him: and above all things put on charity, which is the bond of perfectness. The apostle said to Timothy, "Be not thou ashamed of the testimony of our Lord, nor of me his prisoner: but be thou partaker of the afflictions of the gospel, according to the power of God, who hath saved us, and called us with an holy calling; not according to our works, but according to his own purpose and grace, which was given to us in Christ Jesus before the world began." 2 Tim. i., 8, 9. It concerns every one not to be ashamed of the testimony of our Lord, who hath called them by his grace; and not to be ashamed of any of Christ's prisoners, and afflicted ones for Christ's and his gospel's sake, who abolishes death, and brings life and immortality to light through his gospel; you that believe in the light, know it. Peter saith, in his general epistle to the church of Christ, "As every man" (mark, every man) "hath received the gift, so minister the same one to another as good stewards of the manifold grace of God. If any man speak, let him speak as the oracles of God, not of men; if any man minister, let him do it of the ability which God gives; not of the ability of men's arts and sciences, that God in all things may be glorified through Jesus Christ," &c. For these gifts and graces come from Jesus, into the hearts of the members of his church, whom he is in the midst of. And if any man suffer as a Christian, let him not be ashamed; but let him glorify God, &c. Every true Christian hath the presence of Christ, who hath all power in heaven and in earth given him, to support him with his power, light and life. Christ saith to his believers, "Beware of men, for they will deliver you up to the councils, and they will scourge you in the synagogues, and you shall be brought before governors and kings for my name's sake, for a testimony against them and the Gentiles. But when they deliver you up, take no thought how or what ye shall speak; for it shall be given you in the same hour what ye shall speak; for it is not you that speak, but the Spirit of your Father that speaketh in you. And ye shall be hated of all men for my name's sake: but he that endureth to the end shall be saved. The disciple is not above his master, nor the servant above his lord: it is enough for the disciple that he be as his master, and the servant as his lord: for if they have called the master of the house Belzebub, what will they do to his servant. Fear not them which kill the body, but are not able to kill the soul, &c. A sparrow shall not fall to the ground without your heavenly Father, &c. The hairs of your head are all numbered; ye are of more value than many sparrows. Whosoever therefore shall confess me before men, him will I confess also before my Father who is in heaven; but whosoever shall deny me before men, him will I also deny before my Father who is in heaven. And whosoever shall be ashamed of me and of my words, of him shall the Son of man be ashamed," &c. Matt. x. And again Christ saith, "Whosoever shall be ashamed of me and of my words in this adulterous and sinful generation, of himself also shall the Son of man be ashamed, when he comes in the glory of his Father with his holy angels." Mark, viii. 38. And Christ saith to his disciples, "He that receiveth you, receiveth me; and he that receiveth me, receiveth him that sent me. He that receiveth a prophet, in the name of a prophet, shall receive a prophet's reward; and he that receiveth a righteous man, in the name of a righteous man, shall receive a righteous man's reward. And whosoever shall give to drink unto one of these little ones a cup of cold water only, in the name of a disciple, verily I say unto you, he shall in no wise lose his reward." Matt. x., 40–42. Here ye may see how Christ encourages his disciples, and them that receive them. And John saith, "Among the chief rulers of the Jews, many believed on Christ; but because of the Pharisees they did not confess him, lest they should be put out of the synagogue." John, xii., 42. Too many such believers there are now-a-days, who dare not confess Christ, lest they should lose the favour of men. But Christ encouraged the faithful disciples, and told them they would put them out of their synagogues; yea, that the time should come, that whosoever killed them would think they did God service: and "these things," said he, "will they do unto you, because they have not known the Father, nor me. But these things have I told you, that when the time shall come, ye may remember that I told you of them." John, xvi. 2–4. Here ye may see what Christ told his disciples should come to pass to them. And Saul, before he was converted, compelled the Christians to blaspheme, and made havoc of the church of Christ. Acts, v., iii., and xxii., and xxv. And did not the beast in the Revelations compel both small and great to worship him and his image? And did not all worship it, but they who had their names written in the Lamb's book of life? Did not Nebuchadnezzar set up an image, sixty cubits high, and six cubits broad? And did not he cause a herald to cry aloud, "It is commanded that all people, nations and languages fall down and worship the golden image that Nebuchadnezzar hath set up: and whoso falleth not down and worshipeth, shall the same hour be cast into the midst of the fiery furnace?" And were not Shadrach, Meshach and Abed-nego cast into the furnace? Dan. iii. But God delivered them. Therefore, it is good to be faithful to God, and his worship in spirit and in truth. The Jews agreed, that if any man should confess Christ, he should be out of their synagogue. John, ix. 22. So it for Christ's sake they were excommunicated or their synagogues. But as it is written, "Beh I lay in Zion a stumbling stone and a roc offence, and whoso believes on him, shall not ashamed. So, Christ is a stumbling stone a rock of offence to all the unbelievers, in the which is the life in Christ, whether they be Jc Christians or Gentiles. The Jews believed Ch was to come, from the Scriptures; and the Cl tians believe he is come by the Scriptures; do not believe in the light, as Christ comma and so do not become children of light. Th fore, ye that are believers in the light, and become children of light, walk in Christ, way, life and salvation.

Kingston, the Fifth mo., 1683.

From "Frazer's Magazine"

New Metals.

(Concluded from page 166.)

But the alchemist passed from the earth, lea to an age of less inflated hopes and of a sou philosophy—an age that had learned something the failures of the past—this metallurgic blem for its heritage. To those who have le to linger over the gradual dawnings of hu knowledge in past time, who have felt a del in tracing the growth of some single idea in mind of man through all its doubts, misappre sions, aspirations, rebuffs, successes, on to final triumph—to these, that will ever be interesting history which tells of the prog of the first grand idea of chemical philoso the idea of the individuality, so to say, of the ments; of the elemental character of the met of the non-elemental, the compound character the combinations of these with the vital elem the oxygen of the air. To them the erron dream of Stahl, "the phlogistic theory," will co with it an unceasing interest, albeit that the lance of Lavoisier banished that theory from laboratory, and showed its fundamental error proving that the calx, or earth, weighed more the metal which it yielded— weighed more precise amount which was the exact weight of ygen gas that the metal had taken from the and fixed in solid combination with itself to this earthy oxide. He taught that the m might be won from this its earthy calx or ox but only by some stronger *affinity* than the met own for the oxygen the earth contained. Car has this stronger affinity, and hence the flo molten iron from the vast furnace in which oxide meets in fiery contest with the coal that fe its flames, meets it only to surrender to that its oxygen, and to set the iron free to enter on life of constant labour and trial in the servic man.

This doctrine, then, of the compound natur the metal-yielding earths or oxides, and of elemental character of the metals and of the ygen they contained, was the grand doctrin Lavoisier, and resolved the difficulty of which alchemists, and at last after them, the phlog chemists, had sought in vain for the solu through so many centuries. But chemistry k of other earths besides these that yielded me when heated with charcoal—earths to all int like these, notwithstanding that they had resi all efforts to extract metals from them.

Of these other earths there were several bes magnesia, lime, and the earth of clay, alumina; nearly akin to them, though more easily disso in water, and therefore lacking one of the pr nent characteristics of an earth, comparative solubility, were the alkalies, potash and soda.

ed therefore after Lavoisier's time no great ndity in the chemist who should assert that s a fair object of search, and that there was ground for hope that some means should be d, some more potent affinity than even that of n should be discovered, by the agency of h these earths too should yield up bright s under the torturing inquisition of crucible furnace. Lavoisier himself had proclaimed before, and almost in Lavoisier's time it was ined by some sanguine experimentalists in gary that the anticipation had been realized. hat realization was not yet ripe for accomment, and time had to bring in other ideas and men to contribute to the development of it. ani and Volta (the greatest name perhaps in istory of physics) had introduced a new force e experimentalist. By its agency the coml nature of water—already proved by the rious men whose names now figure in the er controversy"—received a new significance e decomposition which the voltaic pile effected under the hands of Nicholson and Carlisle, e year 1800. They found the oxygen given the positive, the hydrogen at the negative, the water being gradually separated by the c agency into its component elements, oxygen ydrogen Davy, who soon afterwards apd on the scene, saw at a glance the vast reto be developed by this divellent action of attery upon chemical compounds. There is e who cannot feel a sympathizing pleasure as agines the young Davy with the wires of his ous battery brought into contact through the m of the alkali potash, until that moment omposed, and sees him watching a beautiful menon. Little globules of a brilliant metal ually are presenting themselves at the negavire, and lingering for a moment to show him true metallic character, then cease to shine, ecome again converted into the potash out ich they sprung, too powerfully assailed by idizing air, of which the corrosive action is rong for a metal of such eager affinities to in its presence. Davy soon contrived means tering his new-born metal, and exhibiting he world under the name of potassium ; and soon yielded its sodium to the pole of his ic voltaic pile. Both of them are metals to be preserved must be retained out of t with the air; metals, the latter white as and as lustrous, the former with something tint of tin or platinum : both lighter than and therefore floating on it, but also instanisly decomposing it to absorb its oxygen, isappear in it themselves as potash or as

decompose magnesia, lime (calx,) baryta; xygen and the metals " magnesium," "cal-" and "barium," respectively, was but a of the few hours requisite to plan the expe-t. And thus an antagonistic force had been whereby to invert, as it were, the com- force of chemical affinity, so that now

" With rod reversed,
backward mutterings of dissevering power,"

aster of this new necromancy freed from l of these earths beautiful metals, till then

"In stony fetters fixed and motionless."

some of the earths refused the solicitations n Davy's voltaic magic. Among these was a very remarkable kind, named by the chemumina, from its occurence as one of the inents in alum. In the sapphire and ruby traordinary body yields only to the diamond dness, while it far surpasses it as a gem in the beauty if not in the variety of its colour-suite. As the lux-sapphire it rivals the diamond itself in colourless purity and exquisite lustre. As the ruby, it demands a higher price than it, when above a few carats in weight; as the sapphire, there is no stone with which it can be confounded, when of the true azure blue; while as Oriental-topaz, Oriental-emerald,-aquamarine,-peridot,-amethyst, it surpasses in beauty of colour and lustre, and far surpasses in value, the several gems from which it thus condescends to borrow its names. In all of these the alumina is pure, and crystallized in perfect transparency, the colours being due to minutest traces of other metallic oxides, such as iron, chrome, or manganese. Then again, in its less brilliant forms, as corundum and as emery powder, its uses are almost the same as those of the indomitable diamond dust : while in its softer moods, combined with water, it helps to form the plastic element of clay ; and at one moment is seen assuming shapes and wearing tints, as vase and bowl that give it more than the value of sapphire or ruby ; at another, ministering in every shape to satisfy the wants of man.

From the nature of this earth it was difficult to bring it within the sphere of action of the battery. But Davy recognized in his new metal, potassium, a substance whose avidity for oxygen might be utilized for the decomposition of the refractory earth which he could not subdue by his voltaic wires. And so he heated alumina white hot, and passed his new metal in the form of a metallic gas over it, and obtained thereby small globules of a metal which had its source in the alumina employed. This new member of the metal family, *aluminium*, he did not, however, succeed in effectually isolating, and he could not therefore announce its properties. Later it was produced by Wöhler by an analogous but better process, but then not in sufficient quantity, nor in advantageous form, for investigating its physical characters. He obtained it as a powder, and in this finely divided form it is very difficult to ascertain the properties which a metal may assume when fused into a solid mass. Even lead, when in fine division, will burn spontaneously in the air, and it is therefore not to be wondered at that in the pulverulent aluminium of Wöhler that chemist did not recognize those remarkable characteristics which have thrown so much interest round the bars of this metal that have been produced by M. Deville, and exhibited so recently in Paris. Wöhler, indeed, had himself, previously to M. Deville, formed the metal in fused globules. But the method adopted by M. Deville, though in principle similar, was superior in details to Wöhler's process. The metal, as thus obtained, possesses most curious and unexpected properties. Tin-white in color, it is unaffected by the air, and is less disposed to tarnish than silver itself. It is unattacked by any ordinary acid, except muriatic acid, which, and the alkalies, seem to be its only natural chemical enemies. It is very malleable, and when rolled and hammered becomes as hard as iron, a most invaluable property, possessed by no other metal in use. It is an admirable conductor of electricity, and slightly magnetic, like iron. It melts at a lower temperature than silver, so that it possesses all the most valuable properties required of a metal by the artisan. But its most singular property is its lightness. In this respect it stands above all other bodies of the metallic class that are in use. The lightest of these is zinc, which is seven times heavier than water; iron is nearly eight times, silver is ten and a half times, and gold nearly twenty times heavier than water, whereas aluminium is little more than twice and a half as heavy as that fluid, and consequently about a quarter of the weight of silver. An ounce therefore of this metal will go as far as four ounces of silver, or eight of gold. Its price per ounce is, however, at present that of gold, and hence about four times as dear, bulk for bulk, as silver. Doubtless neither commerce nor chemistry will rest till aluminium can be used for household no less than for philosophical purposes, and doubtless also for what may prove a most important application of it, the formation of light, hard, useful, and beautiful alloys with other metals. A bell formed of it would possess singular novelty. Its ring is the sharp clear note of glass, not the fuller tone of metal; one's fancy already anticipates the music in which some instrument whose vibrations shall ring from aluminium bars shall take its part.

Another metal not less curious than aluminium has followed in its wake. The emerald and the beryl are varieties of the same mineral, rivalling all except perhaps the sapphire family in beauty as gems. These contain an earth called by the Greek-derived name of *glucina*, from the sweetness of its salts. The metal of this earth had also been isolated by Wöhler, but its properties are first described by M. Debray, a pupil of M. Deville. It appears as a beautiful white metal, nearly as unalterable as aluminium itself, but with the curious property of being one-fifth lighter, its specific gravity being twice that of water. Lime has also now surrendered its constituent metal, calcium, in pure form, and it proves to be yellow like gold, but unfortunately as evanescent as it is beautiful. The action of the air alone is sufficient to corrode it into its natural calx, the well known earth, lime.

It is curious to see science thus working out, in its own way, and by lights of its own kindling, problems after the solution of which the alchemist groped in darkness, whose obscurity he increased and perpetuated, because he would retain for himself alone and for "the adepts," not for the world, the riches which he sought.

Like the miner, and unlike the metallurgist with whom we commenced, the alchemist delved in dark recesses after gold. He handled indeed metallic ores, but he touched not the living metal. It was only when that ore was brought to the light and into the furnace, that it assumed the real metallic shape; only when the fire of truth has tried it, and the advancement, intellectual no less than material, of the human race is the object to be won, is the transmutation of ignorance into knowledge effected, only then is the superstition of the miner corrected by the higher knowledge of the experienced and sagacious metallurgist.

The transmutations wrought by modern chemistry are as great in character, and, however different in kind, are far more important and useful in their result, than all that alchemy ever dreamed of; they are not the less complete because their character has been so correctly explained.

Selected.

The Cross.

Happy that child, whom the Heavenly Father so *hedges in*, as not to suffer him to escape from beneath his chastening hand. There is no greater mark that God accounts us his children, than that he not only inflicts tribulation but that he supports us under it and walks with us through it. What we have to fear is not the cross, but that we should not sufficiently esteem its uses; or want grace to profit by it, and to reap the whole rich harvest which the harrow was intended to prepare. Amongst all the miseries incident to man, I know of no object more deplorable, or which calls for deeper commiseration, than that of professed dis-

ciples of Christ, on whom the cross is indeed laid, but who are ignorant of its value. Persons who smart under its rigour, but who do not feed on its unction, who sink beneath its weight, but do not enrich themselves with the gold with which it is inlaid; who, viewing it with *carnal* eyes, see neither the hand that inflicts, or the uses it is sent to work out. The Apostle Paul only once and by constraint, alludes to his abundant revelations; but he discourses with us throughout the whole of his Epistles, of his bonds, his labours, and his persecutions; and he seems to esteem himself more favoured in having been called to chains and to dungeons for the name of Christ, than in having been wrapt in the third heaven.

Selected.

"GIVE TO HIM THAT ASKETH THEE."

Oh, stay not thy hand when the winter winds rude,
Blow cold through the dwelling of want and despair,
To ask if misfortune has come to the good,
Or if folly has wrought the wreck that is there.

When the heart-stricken wanderer asks thee for bread,
In suffering he bows to necessity's laws;
When the wife moans in sadness—the children unfed,
The cup must be bitter—Oh! ask not the cause.

When the Saviour of men raised his finger to heal,
Did he ask if the sufferer were Gentile or Jew?
When thousands were fed with the bountiful meal,
Did he give it alone to the faithful and few?

Oh, scan not too closely the frailties of those,
Whose bosoms may bleed on a cold winter's day,
But give to the friendless, who tells thee his woes,
And "from him who would borrow, oh! turn not away."

REFLECTIONS IN A SICK CHAMBER.

Cast down, but not destroyed! I bless the hand,
My Father's hand, which strengthens while it strikes,
And should the furnace rage with sevenfold heat,
My Father's even there! Mighty the waves,
But mightier He alone, who calms the storm,
Dark and mysterious is the pilgrim's way,
But lo! the Sun of Righteousness shines forth,
And cheers my soul with healing in his beams.
I know the voice that call'd me from the world,
And in the chamber of affliction taught
Eternal truths, on which I love to dwell.
The school of suffering is the school of light.
'Tis here I learn to trample on the world,
And justly estimate all earthly good.

For "The Friend."

Early Anti-Slavery Advocates.

RALPH SANDIFORD.

(Continued from page 165.)

Ralph's book was printed at the new printing-office of Franklin & Merideth; but as it might prove an unpopular work, the printers' names were not attached to the first edition. It merely says, at the foot of the title page, "Printed for the Author, Anno 1729." R. V. says, "When his book came out, a copy of it reached the hand of the Chief Justice of the province, who threatened him with severe penalties, if he permitted it to be circulated." After a careful reading of the work, it is difficult for me to conceive, what legal ground for prosecution any one could find in it. No one is assailed individually. The author strikes at a prevailing practice, and no one in the ranks, has more to bear than his neighbours. Why David Lloyd, then Chief Justice, the fierce advocate of the political rights, and freedom of the subject, whose love for the liberty and the interests of the settler, led him often to do injustice to the Proprietary, should have sought to suppress this honest expression of the feeling and judgment of a free citizen, we can scarcely imagine. Perhaps, if he ever used any efforts in the case, it was before he had seen and read the book. We know not, that any obstruction was thrown in its circulation, whilst in Keimer's Paper, the "Pennsylvania Gazette," it was advertised for sale.

Ralph Sandiford having prospered in his worldly affairs, was now ready to retire from business. He intended to settle himself as a farmer, but was desirous of first visiting his near relatives in England. His stock of goods, however, were not easily disposed of in a summary manner. On the 14th of Sixth month, 1729, a few months after the publication of the first edition of his book, he puts this advertisement into the Pennsylvania Gazette.

"Ralph Sandiford, shopkeeper, over against the court-house in Philadelphia, intends for England in two months, therefore desires all persons indebted to him to come and discharge the same, to prevent the expense of legal prosecutions. *Also, any persons who have any demands on him, are desired to come and receive the same. In the mean time he is for selling off his shop and household goods either by wholesale or retail, which consists of bedding, and pewter, and other necessaries.* Also looking-glasses of most sizes, and bottles of all sizes from gallons to half gills. Also, good wine, rum, sugar, molasses, salt, and most sorts of fruit, and grocery, and drugs for dying. *Also, if any person will take the whole, may have two months' credit on good security.*

RALPH SANDIFORD.

N. B.—I take New Castle money for all sorts of English goods, and will sell remnants cheap."

Not even the temptation of getting rid of New Castle money, could induce people to buy all Ralph's stock. His shop over against the court-house, continued open another year, and there he vended his books. Sometime in 1730, he printed a second edition. The first edition was intended, it seems, principally for sale—the second for gratuitous distribution. About the close of 1730, he appears to have paid his long contemplated visit to England. His business was not entirely settled, and he appointed Matthias Aspden, the father of that Matthias, the division of whose great estate has so much occupied the legal world in this country for the last twenty years, as his attorney. The following advertisement first appears in the Gazette, bearing date from the 15th to 22d of Tenth month, 1730.

"Ralph Sandiford being bound for England, hath printed a second impression of his Negro Treatise, to be distributed by him *gratis*, or by Matthias Aspden his attorney; unto whom all persons indebted to him are desired to pay the same with speed, to prevent charge to themselves. And whereas some persons would not apply for his books gratis, the printer having leave from the author, has them ready for sale at 12*d.* apiece, at the new printing office, near the market."

Franklin would never have undertaken thus publicly to sell the book, if he thought there had been any danger of trouble or legal prosecution for it. Of Ralph's visit to England, we have no information; but in 1731, he removed to a farm he owned, nine miles north of Philadelphia, on the road leading to Bustleton. He still retained a stock of merchandize, and probably kept a store on his estate.

Here he resided the remainder of his life. In the year 1732, he was several times visited by Benjamin Lay, who, having removed to Philadelphia, was anxious to see one who had had the courage publicly to attack slavery, in a slaveholding community. Ralph had many an animated contest in words with the slaveholders, and his mind became at times unsettled through the violence of his feelings. Yet he was generally in a condition to attend to his own business, and manifested much shrewdness in his transactions. He was hospitable to all, and was disposed generous assist, whilst wisely counselling the poor.

But he had his troubles, independently of testimony against slavery. To carry on his ness without slaves, it was necessary to have men, and in Pennsylvania, in those days, the men were principally "redemptioners." Th persons, who, to pay for their passage across Atlantic, were sold for a term of years. held one such,—we know not how many In the Pennsylvania Gazette, Seventh mo. 18 26th, 1732, we find the following lively as truly characteristic advertisement from his pe

"Run away from Ralph Sandiford, a ser man named John King. Sometimes he writes name John Landman King. He is marked I. K. on one of his thumbs, with gunpowder. is a weaver by trade, short in stature, but fat well set, and when he moves his mouth, he h dimple in his cheek. He has short curled h hair, and had on an ozembrigs shirt, vest, breeches, and a brown coat. He is a Devonsh man, and has taken with him a gray mare, m ed with a half penny cut on the left ear; als silver spoon marked C. H. Whoever secures said servant so that he may be had again, shall h forty shillings reward, and reasonable charges by RALPH SANDIFORD."

Towards the close of 1732, he became m more unwell. Benj. Lay says, "that through affliction about slavekeeping, and infirmity of bo he fell into a sort of delirium." It was par insanity, which at times he was much relie from. During one of his sane seasons, finding end apparently approaching, he drew up or tated a new will. It thus commences,—"B remembered that I, Ralph Sandiford, of Lov Dublin, in the county of Philadelphia, mercha being sick of body, but of sound mind and me ry, praised be the Lord, do make this my last and testament, in the manner following: Fi I commit my soul into the hands of Almighty G my Maker, hoping through the meritorious de and passion of Jesus Christ, my only Saviour Redeemer, to be everlastingly saved; also I co mit my body to the earth, to be therein decen buried at the discretion of my executors, here after nominated." He then proceeds to distrib the property he had accumulated, which was c siderable. Ten pounds to the men's, and pounds to the women's Monthly Meeting Friends in Philadelphia. Three pounds to Eli beth Whartenby, a valuable ministering Friend moderate circumstances, and three pounds to W liam and Esther Clare. Esther was also a labou in the gospel of Christ Jesus, of an eminent and in full unity with her own religious Socie After many small legacies including one to e of his two brothers, James and Thomas, he queaths to his housekeeper, Mary Peace, a estate in one of his farms, while he gives her ever the housings thereof, and the goods in shop. To his late servant, Susanna Morris, gives a life estate in his farm at Cheltonham. the death of Mary Peace and Susanna Morris, two farms were to be sold, and the proceeds to paid to his three sisters, or to their heirs.

He executed the will on the 7th of First mon (March,) 1732–3, appointing William Clare Matthias Aspden executors. As his body we ened, he was preserved in quiet composure, was enabled calmly to wait for his release fr suffering.

The impression left on the mind, after read the various documents relative to Ralph Sandif including his book, is, on the whole, pleas We feel no doubt that he was a real christ philanthropist, who endeavoured honestly to

he believed was his duty. Through human ness, the stirring of a quick temper, and a sometimes a little unstrung, he, without , made some mistakes, yet there is an under- nt of sweetness to be found everywhere gh his writings, even where a little of the of bitterness, seems to float on the surface. e doubt not but that, when on the 28th of hird month following the execution of his his heavenly Father released him from the of time, his close was peace.

QUERIES.

What number of families or individuals have been itously furnished with the Holy Scriptures by the iary during the past year?
What number of Bibles and Testaments have been by the Auxiliary within the past year?
How many members, male and female, are there ging to the Auxiliary?
What number of families of Friends reside within mits?
Are there any *families* of Friends within your limits upplied with a copy of the Holy Scriptures in good type, and on fair paper; if so, how many?
How many *members* of our Society, capable of read- he Bible, do not own such a copy of the Holy Scrip- ?
How many Bibles and Testaments may probably sposed of by sale within your limits?
Is the income of the Auxiliary sufficient to supply within its limits who are not duly furnished with oly Scriptures?
What number of Bibles and Testaments would it ecessary for the Bible Association to furnish gratu- ly, to enable the Auxiliary to supply each family?
What number would be required in order to fur- each member of our religious Society, capable of ng, who is destitute of a copy, and unable to pur- e it?
How many Bibles and Testaments are now on ?

For "The Friend."

n looking over the transactions of the New k State Agricultural Society for 1853, I find the first *premium* of twelve dollars for the farm was awarded by the Committee of the yne County Society to Job Travis of Galen, a of colour.

His farm contains eighty-five acres, of which -five are under cultivation. He bought his for thirty-three dollars per acre only six years since, during which time, with limited means, and his own personal and well-directed industry, he has repaired and improved his dwelling, making it convenient, and, in all respects, well adapted to his wants and tasty in appearance; built one barn, thirty-six by forty-eight; tool-house and horse barn, thirty by forty, with stone wall basement under both, in which he has well-arranged stalls and shed for stock, and where the manure is kept sheltered until put on the land. Water for stock is conveniently situated in his barn-yard, brought from a field of higher ground, in pipes, where the head of the fountain is obtained from under drains made of stone, upon a once cold, wet side hill, where there is now wheat growing, with the appearance of a naturally warm, dry soil, well adapted to the growth of grain or grass.

"Many other places on this farm, once mire holes, are reclaimed in the same exemplary manner, where good crops are now growing of corn and wheat, all appearing to be no other than fields clear of stone and stumps, and of the most fertile dry soil, which artificial appearance, so desirable, is the work of the commendable industry of the owner; many rods of these stone under drains are made, where the stone that once cumbered the ground, obstructing cultivation and making an unsightly appearance, are now doing the kind office of draining and warming the land, causing it to produce crops that will repay the outlay.

"Here were growing twenty-five acres of wheat that for uniform growth and all the most promising appearances, was most gratifying; all on ground ploughed after the middle of August, and but once. One nineteen and a half acre lot, for an experiment, had been temporarily divided, pasturing sheep upon one part and cattle upon another, and showing a very perceptible appearance in the wheat in favour of the sheep pasture over that portion pastured by cattle. Such experiments upon any branch of agriculture should be more frequent by all practical farmers, the result of which, being made public, could have none but a profitable tendency.

After once ploughing for wheat the land is fitted for seed with the harrow and cultivator, and the seed put in with the drill. The last crop from the above-named lot was over thirty bushels per acre, which is about a fair average yield on his farm.

"His corn field was clean, his corn standing even and in very straight rows, looking thrifty, worked with a cultivator, and the surface kept level as possible; the plough rejected, because it cuts the corn roots, uncovers the long manure, and turns up the undecayed sod. His yield of corn is annually from fifty-five to sixty bushels per acre.

"He has eight horses, including his teams, one valuable matched pair, which took the first premium at the county fair, in 1852. His cattle consist of four cows and a few head of young stock, some native and some Durham. He has sixty sheep of good quality, and some fifteen to twenty porkers of various sizes, all in thriving condition and well cared for, with seeming close attention to have no stock but best quality that will prove most profitable."

This example is a very remarkable one, and should incite industrious people of colour to settle in neighbourhoods where industry and good conduct will be rewarded with success, and the respect and kind feelings of their white neighbours.

Our strength may be spent on outward objects, even such as are of a public and praiseworthy character. "Strangers have devoured his strength, and he knew it not."

For "The Friend."

Boarding School for Indian Children.

My attention has been turned to the following circular issued on behalf of the Indian Committee, and setting forth the pressing want of help at the Boarding School. This Institution, I learn, is doing good service for the Indian children, who are making satisfactory advancement in learning under the care of the teacher, while the care and government exercised over them, both in school and in the family, are producing a favourable effect on their characters and training them for future usefulness.

Probably there is no other mode in which so great an amount of benefit could be conferred on this much injured and down-trodden people, as by extending to their children the advantages of a good education, imbuing their minds with correct moral and religious principles, and inuring them to industry and domestic economy.

It is painful to think that a school so well conducted and calculated to confer such lasting benefits is likely to be broken up, as I learn must be the case, unless early assistance is obtained. A man to assist on the farm and have the care of the boys out of school, and two women to aid in the domestic department, I understand are wanted. It is much to be desired that the situation and wants of this very interesting concern might claim the serious attention of Friends generally; and I cannot but think, if this were the case, some would find it their duty, under the influence of christian love, to lay aside selfish considerations, and devote themselves for a time at least, to this work of benevolence.

When we consider the comforts and ease we enjoy, growing in no inconsiderable degree, out of the possession of lands which once belonged to these children of theforest;—the kindness they showed to our forefathers when they were few and weak, and the liberality with which they supplied their wants, surely there is a debt of gratitude due from us to them; and now that they have become a feeble and helpless remnant, we are loudly called upon to fulfil the golden rule, of doing to them as we should wish them to do to us, were our conditions reversed.

I hope the circular will be carefully read and considered.

Philadelphia, First month 1st, 1856.

DEAR FRIEND:—The Committee for the gradual civilization and improvement of the Indian Natives, wish to call the attention of Friends to the present condition and wants of the Boarding School for Indian children under their care.

The Farm is contiguous to the Indian Reservation, on the Alleghany River, in Cattaraugus County, New York, about 16 miles from Little Valley Station, on the New York and Erie Rail Road, and 9 miles from the town of Randolph.

The building for the accommodation of the family is large and commodious, and the School House is adjacent to it. The present number of boarders is 17, and there are applications for the admission of five others. Several day scholars also attend. The children make satisfactory progress in their learning; and when we consider how little they have been accustomed to restraint before coming to school, their conduct, both in and out of the school, is commendable. They generally rise about five o'clock in the morning, and breakfast at six. Some of the girls then assist in milking, while others are engaged in the domestic employments of the house. The larger boys assist some in the Farm work, while the smaller ones cut and carry in the wood for fires, and also bring a supply of water for the house from the well. The girls knit and sew; several have made bed quilts;

and under the careful instruction of the women Friends in the family, they make considerable progress in these and other useful branches of housekeeping.

At half past eight o'clock school commences, and continues until half past eleven; when the bell rings for dinner; school opens again at about one, and continues until four o'clock, when the domestic duties are again entered upon. A short evening school is held during the winter.

The children go to their meals and to bed, in a quiet and orderly manner; at table, they sit still until all are helped, and conduct themselves like the inmates of other well regulated families. The Holy Scriptures are frequently read to them, and meetings for Divine Worship are held on First and Fifth days in the week, in which the scholars conduct themselves in an orderly and often in a serious manner. One of the girls about 13 years of age, has recently written a letter to one of the Committee, in which she mentions that about three years ago, she did not know how to spell, and now she reads in the Testament, Select Reader, and other books—learns Geography and Grammar, and is pretty well advanced in Arithmetic. Her letter, which is interesting and intelligent, is written in a fair hand and accurately spelled. This case furnishes satisfactory evidence, that the minds of the Aborigines are capable of much improvement.

The committee believe that the mode now pursued of educating the children *in the family*, where they may be properly disciplined and trained in habits of cleanliness and industry, as well as the knowledge of Housewifery and Agriculture, while their moral and religious education may be closely attended to, promises to confer lasting benefits on the Indians. It is our opinion also, that the school is now as efficiently and satisfactorily organized as at any former period. It is greatly to be regretted, that the requisite help for conducting it should be wanting. Two of the female Friends now there expect very shortly to leave, and unless their places can be supplied soon, the school will probably have to be closed. A man Friend is also wanted to aid in the school, and in conducting the farm, and to have the oversight and care of the boys when not in school.

We respectfully request that thou wilt make known in thy neighbourhood the wants of the Committee, as well as the above information concerning the condition and usefulness of the Institution, and encourage such Friends as may be suitable to make early application to the Committee.

On behalf of the Committee,

JOSEPH ELKINTON,
THOMAS EVANS.

For "The Friend."

Trust in the Lord and do Good.

In reading the history of the children of Israel contained in the Scriptures of the Old Testament, the long suffering kindness, and superintending care of Divine Providence over a people whom he had chosen for great purposes, is conspicuous, notwithstanding their constant disposition to violate his law, and forget his power, marvellously displayed for their benefit. It also furnishes evidence of the different effects which the example of righteous and wicked rulers had upon the people at large. Judges and elders, who kept their allegiance to the Most High, had a powerful influence to deter the people from committing idolatry. When they obeyed his commands, and worshipped him, his blessing rested upon them, and he defended them from the inroads of nations, whose idols he had commanded them not to bow down to, nor were they to take their sons or daughters in marriage, lest they should be drawn away from the worship of the living God. It is said that "Israel served the Lord all the days of Joshua, and all the days of the elders that overlived Joshua, and which had known all the works of the Lord, that he had done for Israel." These were men of experience in the dealings of the Lord with his people, and their hearts were bound to keep the law and the testimonies, and the Israelitish church prospered under their administration. But after the death of Joshua, and "all that generation were gathered unto their fathers, there arose another generation after them which knew not the Lord, nor yet the works which he had done for Israel. And the children of Israel did evil in the sight of the Lord, and served Baalim. They forsook the Lord God *of their fathers* which brought them out of the land of Egypt, and followed other gods, of the gods of the people that were round about them, and bowed themselves unto them, and provoked the Lord to anger." "And he delivered them into the hands of spoilers that spoiled them, and *sold them into the hands of their enemies* round about, so that they could *not any longer stand before their enemies*." Here the consequences of obeying the divine law are strongly contrasted with the results of disobedience in following the example of those who served not the Lord. These things were written for their instruction and warning, and also for ours, that we may see the condition which rebellion against the Almighty will land us in by mixing with them that serve not God, and joining in with their unholy spirit and practices.

After the form of their government was changed, those kings who feared and served the Lord, were made a blessing to the people. They were instrumental in delivering them from bondage to their enemies, into which they had been reduced by their wickedness under the reign of corrupt princes, and while they adhered to the worship of the God of their fathers, they were preserved in peace and safety. When they were invaded by other nations, righteous kings put their trust in his omnipotent arm for deliverance. Asa, king of Judah, had an army of nearly six hundred thousand "mighty men of valour," and yet when he went out against the Ethiopean army, he "cried unto the Lord his God, and said, Lord it is nothing with thee to help, with many or with *them that have no power*. Help us, O Lord our God, for *we rest on thee*, and in thy name we go against this multitude. O Lord, thou art our God; let not man prevail against thee." "So the Lord smote the Ethiopeans before Asa and before Judah, and the Ethiopeans fled." "And the Spirit of God came upon Azariah, the son of Oded, and he went out to meet Asa, and said unto him, "Hear ye me, Asa, and all Judah and Benjamin. The *Lord is with you while ye be with him*, and *if ye seek him* he will be found of you, but *if ye forsake him he will forsake you*." After recounting the vexations in which Judah had been involved by departing from the true God, he said, upon their deliverance, "Be ye strong therefore, and let not your hands be weak, for your work shall be rewarded." And having seen the display of the Lord's power for their help, "they entered into a covenant to seek the Lord God of their fathers with all their heart and with all their soul," and there was no more war unto the five and thirtieth year of the reign of Asa. In the thirty-sixth year, Baasha, king of Israel, came up against Judah, and Asa sent the *treasures of the Lord's house* to Benhadad, king of Syria, to hire him to break league with Baasha; and Benhadad sent an army against the cities of Israel, which induced Baasha to withdraw from his purposes against Judah. Here Asa let go his confidence in the Lord and placed it upon man; and He, the seer, came and said to him, "because thou hast relied on the king of Syria, and *not relied on the Lord thy God*, therefore is the host of the king of Syria escaped out of thy hand. Were not the Ethiopians and Lubims a huge host, and very many chariots and horsemen? Yet *because thou didst rely on the Lord*, he delivered them into thy hand. For the eyes of the Lord run to and fro throughout the whole earth, to show himself *strong in the behalf of those whose heart is perfect towards him*. Herein hast thou done foolishly; therefore from henceforth thou shalt have wars." Losing his trust in Divine protection, he became angry with the seer for his plain rebuke, put him in prison, and began to oppress the people; he also came diseased in his feet to a great degree, yet in his did not seek the Lord in his disease; a sad reverse in the character of a king who had been signally favoured of the Most High.

Jehoshaphat, his son, succeeded him in the kingdom, and "walked in the first ways of his father David, and sought not unto Baalim, but sought to the Lord God of his father, and walked in his commandments, and not after the doings of Israel. Therefore the Lord established the kingdom in his hands, and all Judah brought to Jehoshaphat presents; and he had riches and honour in abundance." An error which he committed in joining Ahab against the Syrians, would probably have cost him his life, had not the Lord delivered him when he cried out, moving those who surrounded him to depart from him; an instance of the mercy of the Almighty to those who love him, even though through too easy compliance with the solicitations of ungodly persons, they have been unwarily drawn into an alliance for a time contrary to his will, for which he was reproved by Jehu, son of Hanani. After this the king went out through the people from Beersheba unto mount Ephraim, and "*brought them back unto the Lord God of their fathers.*" He set judges in the land, and said to them, "Take heed what ye do, for ye *judge not for man*, but for the Lord, who is with you in the judgment. Wherefore, now let the fear of the Lord be upon you; take heed and do it; for there is no iniquity with the Lord our God, nor *respect of persons nor taking of gifts*." When righteous men are placed as rulers and judges their principles and actions strengthen the hands of upright people, and encourage them to promote righteousness in the land. Every one who has read history must have observed that the reign of virtuous kings furnishes a peculiar sensation of delight, while the abominations attending the reign of wicked men produce feelings of sadness and horror. The Divine blessing rests upon one, but is withdrawn often, in great measure, from the other.

At a future period of his reign, Jehoshaphat was told that a great multitude was coming against him, and he feared and *set himself to seek the Lord*. He proclaimed a fast throughout Judah, and the people assembled *to ask help of the Lord*; and the king stood in the congregation and prayed unto the Lord, and said, "O our God, we have no might against this great company that come against us, *neither know we what to do; but our eyes are upon thee*." The advantage of calling upon the Lord, and placing his confidence in his mercy and power, was soon manifest. For the Spirit of the Lord came upon Jahaziel and he said: "Hearken ye, thus saith the Lord unto you, Be not afraid nor dismayed by reason of this great multitude, for the battle is not yours but God's. To-morrow go ye down against them; behold they come up by the cliff of Ziz, and ye shall find them at the end of the brook, before the wilderness

1. Ye *shall not need to fight in this battle;* ourselves, *stand ye still,* and see the salvation o Lord with you, O Judah and Jerusalem: ot nor be dismayed; to-morrow go out against , for the Lord will be with you. And *Jehosat bowed his head with his face to the ground."* as they went forth early in the morning, the said to the people, "Believe in the Lord God, so shall ye be established, believe his ets, so shall ye prosper." And he appointed rs "that should praise *the beauty of holiness* ey went out before the army, and to say, *se the Lord, for his mercy endureth forever."* ad of drawing their swords and attacking the y, they began to sing and to praise the Lord osts, *in whom they had put their trust,* and foes rose up and destroyed one another, so when Judah came towards the watch-tower in wilderness, they looked to the multitude, and dead bodies had fallen, and none escaped. ll the fear of God was on all the kingdoms of countries, when they had heard that the fought against the enemies of Israel." Thus they delivered by putting their trust in the alone, keeping his commandments, and reng the idolatrous practices of other nations. le Judah and Benjamin served God, they cered, and were defended in a miraculous ner; but when they forsook him and served m, the Lord gave them over into bondage reat distress.

For "The Friend."

Meteorites.

he essay on meteorites, just published in "The iend," is one of considerable scientific interest, t gives an unsatisfactory solution of the origin ese strange visitors. If the writer would again up his pen, and treat the plausibility of her theory respecting them, it might gratify who have perused the article.

he idea of their being formed of materials ing in the earth's atmosphere, is justly set aside ing without foundation. The probability of being of lunar origin, cannot be determined out precise mathematical calculations. The ates of Laplace and others who have favoured theory, are perhaps wanting in some material —the projectile force of the volcanoes of the n. The power produced by the expansion of s, is tremendous, so much so, that did we not ive its effects, it would be taxing our credulito much, to ask us to believe it. But when re told of a force sufficient to throw a mass of , weighing perhaps tons, from the surface of hoon beyond the influence of its attraction, mind is lost in bewilderment. This essay s no pretensions to the skill which can deine the exact equipose of the wheeling globes traverse the depths of space; and if conjecs here thrown out should be far from the truth, aps a more scientific pen will correct them. fter making due allowance for the diminished r of gravitation at the moon, it seems pro- e that a projectile must fly at least 40,000 y thousand) miles from its surface, before it d be left free to move off in space.

force that would produce such an effect would kely to have rent the whole globe to fragments; we might have expected instead of our soli- moon, an array of smaller satellites, of various ced dimensions, down to the smallest star le to the eye.

erhaps the moon may at one time have so exed and the larger parts again united; but here re lost in conjecture.

nother source from whence these foreign bo- may have been derived, is one where there has apparently been such a disruption, as that suggested in the case of the moon. The asteroids which have been traced, now number about 30. It is most probable that an explosion that could dissever a mighty globe into so many distinct bodies, each retaining a continuous orbit, would at the same time send off innumerable smaller fragments, that would lose the counterpoise, by which the original planet was kept in its course. These fragments would wander in space for indefinite periods, gradually deviating from their accustomed path, and it is quite within the range of probability, that individuals of them should from time to time alight on the earth. If the essayest can throw any further light upon this last theory he may bring his article to a more fitting conclusion.

For "The Friend."

I have long been a reader of "The Friend," and can say its columns often afford me both instruction and encouragement. In perusing the 18th number, I was struck with the extract from the journal of Thomas Wilson given in a communication dated from Canada West. The sentiment expressed by that worthy Friend in the conference with G. Keith and his followers in Philadelphia, is well worthy for Friends every where to bear in mind, where he says "that if he (G. Keith,) and his company were sound in faith and doctrine and men of God, they should have kept up their testimony for the Lord in the meeting, and if there must have been a separation, such unsound men or persons would have gone away from Friends as those did formerly, of whom John said "They went out from us because they were not of us, for if they had been of us, they would no doubt have continued with us; but they went out that they might be made manifest that they were not all of us."

Thomas Wilson and James Dickinson were true yoke-fellows, being men entirely devoted to the cause and honour of their Divine Master, who had bestowed on them extraordinary gifts, which they exercised for the consolation and edification of the church, and though dead, they yet speak in the above to those who, zealous for the law and the testimony, may in this day of peculiar trial, appear in many places to be very few among many. May such maintain their integrity, not shrinking from the accompanying suffering and "keep up their testimony for the Lord *in the meeting.*"

THE FRIEND.

SECOND MONTH 9, 1856.

The winter of 1855–6 will be a memorable one, on account of the severity and long continuance of the cold. From all parts of our widely extended country, the intelligence represents the average low state of the thermometer to have been unprecedented for many years. In our own State, within one hundred and fifty miles of Philadelphia, the mercury has sunk as low as 28° below zero; in the neighbourhood of the city, it has been from 10° to 19° below zero. The ice in the Ohio river is said to be fifteen inches in thickness; at St. Louis, situate on the Mississippi, twenty miles below the mouth of the Missouri, the river has been so firmly bridged by ice that teams have been passing over it for weeks. Even the Brazos river in Texas has been so firmly frozen over, that it would bear cattle and horses, and at Charleston, S. C., they have been storing ice for summer use, gathered from ponds in the neighbourhood. It is said that in Florida the frost has killed all the orange-trees.

A writer in the "North American" gives the following comparative table of the temperature of the First month, from the mean of two daily observations—one, at about half an hour after sunrise; the other, at about eleven o'clock at night:—

1837	23.84	1847	31.06
1838	32.59	1848	34.62
1839	28.06	1849	26.90
1840	22.74	1850	33.35
1841	30.72	1851	32.70
1842	33.38	1852	24.53
1843	36.06	1853	30.24
1844	24.80	1854	30.00
1845	35.21	1855	31.78
1846	31.13	1856	20.66

The average of these mean calculations being 29.72.

From the above, it will be seen that the month just passed, has been the coldest First month, in Philadelphia, within the last twenty years.

The thermometer from which these observations have been registered, hangs out of doors, with a northern exposure, in the neighbourhood of Penn Square. The same thermometer has been used, and in the same situation, during the whole of the time.

The coldest mornings in the past month were the 9th, being 5 degrees below zero; and the 10th, being 2 degrees below zero.

Although owing to more constant employment, and the emigration of a considerable number of the poor and more industrious class from the city, there has so far been less suffering than occurred last winter, yet there is no little now, and the continuation of severe cold, and the almost entire suspension of employment connected with navigation, must press very heavily upon very many, so that it behoves all among us, who have the means, to be prompt in seeking out and rendering assistance to the destitute. Out door relief is now very much withheld by the Guardians of the Poor, and unless some general effort to supply food and fuel is made, we fear there will be much distress and suffering from want.

Green's Court Soup House.

The long continued cold weather, and the suspension of business in consequence of the closing of navigation, have caused an unusual demand for soup and bread at the above-named establishment, while the high prices of flour, meat, rice and other articles used, greatly increase the expenses of the society. Depending for the means of carrying on its operations, on the voluntary contributions of the benevolent, the Society is desirous of calling attention to the subject, and donations in money or any of the above-named articles, will be gratefully received by Jeremiah Hacker, Treasurer, 144 S. Fourth street, or Thos. Evans, 180 Arch street.

SUMMARY OF EVENTS.

EUROPE.—The steamship Arabia brought Liverpool dates to 19th ult. The most important news relates to the acceptance of the terms of peace proposed to Russia by the Austrian Cabinet. The first announcement was made from Vienna by telegraph to the London Times, in the following words: "Russia accepts the allied propositions unconditionally. This is authentic." This despatch caused great sensation in England. The funds rose three per cent.; cotton advanced, and breadstuffs declined. A subsequent despatch from the British Minister at Vienna, states that the Russian Government had simply agreed to enter into negotiations upon the basis proposed. Whether these negotiations will result in peace, of course will depend upon the dispositions of the parties. They are all no doubt tired of the war.

The War.—Numerous ambuscades of Cossacks were distributed around the allied camp in the Crimea, but vigilance prevented many stragglers being captured. Several additional explosions had been made in the Sebastopol docks, and they were nearly destroyed. France and England each reserve one of the gates by which they were enclosed, as a trophy. A party of

French wearing white coats to prevent their being seen in the snow, advanced by night and surprised Baidar. They bayoneted the outposts, and retreated when the Russian reserves came up. General Mouravieff was advancing in Asia; as the latest dates his advanced posts were within three hours' march of Erzeroum. The Turkish Government has published an account of the fall of Kars tending to throw the responsibility of the disaster on Omar Pacha; he on the other hand blames the Turkish Ministry for withdrawing the needful supplies. Omar had tendered his resignation, but the Sultan refused to accept it. The forces under his command have been directed to protect Erzeroum; part of them had arrived at Trebizond.

GREAT BRITAIN.—Palmerston's Ministry was gaining adherents in Parliament. The President's Message was variously commented on by the press, but the general opinion was favourable. It was considered moderate in tone, yet expressing the President's views with dignity and precision. No one expected a rupture between the two countries. A treaty has been made with Japan, opening to British commerce the ports of Nagasaka and Hakodadi—the same as to the Americans. Consols had advanced to 89¼ a 89⅞, with a steady market. All the European stocks have participated in this advance. The Liverpool cotton market was active at an advance of ⅛ to ¼*d*. Sales of the week, 58,700 bales. Flour had fallen 1*s*. per bbl.

FRANCE.—The Minister of Finance states in his report, that the financial condition of the country is excellent, but he expresses the hope that the Emperor will postpone expenditure on all enterprises, except those of urgency. The Council of War continued in session at Paris. There had been a discussion respecting the withdrawal of the allied forces from the Crimea. It was opposed by the Admirals, as it would take six months to remove the material of the last campaign.

PORTUGAL. — Heavy rains and a freshet in the Douro had occasioned great damage.

AUSTRIA.—The Emperor has signed a decree relating to Protestants. It is said to be liberal in most of its provisions. The marriage of Catholic priests converted to Protestantism, is however forbidden.

PERSIA.—The Persian official journal announces that the Persian government is determined to maintain neutrality.

UNITED STATES.—*Funds in the Treasury.*—The U. S. Treasurer reports that the net amount in the Treasury, subject to draft, on the 28th of First month, was $24,081,550.

Minister to England.—It is understood that George M. Dallas will succeed James Buchanan in that post, and that Buchanan will remain in London until the arrival of his successor.

Congress.—On the 2d inst., the House of Representatives resolved by a vote of 113 to 104, that the Speaker might be elected by a plurality vote. Orr then unconditionally withdrew as the Democratic candidate, thereby being a probability that Aiken, of S. C., would command the votes of the democrats and a considerable portion of the "Americans." Three preliminary votes were taken, and then the final ballot which resulted as follows—Banks, 103; Aiken, 100; Fuller, 6; Campbell, 4; Wells, 1. Clingman, of N. C., subsequently offered a resolution that by reason of the adoption of the plurality rule, and the votes taken under it, Nathaniel P. Banks has been duly chosen Speaker, and is hereby so declared, which was adopted, 156 to 39. The Speaker was then qualified, and made the usual address. On the 4th, the Speaker administered the oath to support the Constitution of the United States to the members. A Committee was appointed to wait upon the Senate, and inform that body that a quorum of the House had assembled and elected a Speaker, and that the House was now ready to proceed to business. The usual Committee was appointed to wait upon the President in conjunction with one from the Senate, and inform him that the two Houses were ready to receive any communication he may be pleased to make.

California.—The two steamers which arrived at New York last week, brought over a million and a half in gold, and San Francisco dates to First mo. 5th. The weather throughout California had been unusually cold. Ice had formed in San Francisco and Sacramento, about half an inch in thickness, and much snow had fallen in the mountain regions. There was plenty of water at the mines, and the miners were busy washing out. The Legislature was to meet at Sacramento on the 7th. The claim of the Catholic church to the Mission buildings, the graveyards, orchards and vineyards attached to them in the twenty-one old Missions of California, had been confirmed by the United States Land Commissioner. Its claim for one square league of land in each mission, on account of the Christian Indians, was rejected. A severe shock of an earthquake was felt in San Francisco on the 24 ult. The loss by fires in the State during the year 1855, is estimated at over $2,000,000. The number of legal executions during the year, was 9, all for murder. There were also 48 executions by Lynch law, for murder, theft, &c. The cases of homicide numbered about 550. During 1855, the passengers arriving by sea at San Francisco, were 31,759, and those departing were 22,898. The gold exported during the year, as shown by the Custom House books, was $45,182,631. Some millions in addition were doubtless taken by returning passengers. During the year, there were 267 marriages in San Francisco; 72 applications for divorce, and 41 divorces granted. Imported merchandise generally was steadily declining in price. *The Panama Railroad* was in fine working condition, and its business constantly increasing. A train of eight cars came across on the 17th ult., loaded with silver. The amount, $1,800,000 was en route for England.

Philadelphia.—Mortality last week, 240; of small-pox, 25. The average temperature of the First month taken at sunrise and at 11 P. M., in the western part of the city, was 29.06. A similar record kept for fifteen years, shows that the last month was the coldest in that period. The next coldest was the First month, 1837, in which the average was 23.84. During the year 1855, 38,657 persons were arrested by the regular police force of the city. Of these, 10,470 were white natives of the United States; 2281 were coloured persons; 21,830 Irish; 2452 Germans; 1281 English and the remainder foreigners of various nations. The great majority of the arrests were for drunkeness and the crimes resulting from intemperance. The funded debt of the city amounts to $16,781,470, and there are outstanding warrants against the treasury, to the amount of $1,536,599. Of the funded debt, $8,650,000 are railroad loans, for which the city holds stocks to a corresponding amount.

Cincinnati.—On the 4th, the thermometer stood at 18° below zero. The ice on the Ohio was 18 inches thick.

New York.—Mortality last week, 335.

Miscellaneous.—The Ice Barrier.—Communication between Baltimore and Norfolk is entirely suspended by the ice in the harbour. Annapolis roads is free of ice, and is the only open harbour in the whole bay.

The Cold.—The present severe weather has prevailed all over the United States, even to the extreme south. On the Upper Brazos, Texas, the thermometer was below zero, and cattle were dying from the effects of the cold.

Frightful Tragedy.—On the night of the 27th ult., a number of slaves attempted to escape from Kentucky, and crossed upon the ice to the Ohio shore. They were pursued, and the place in Cincinnati where some of them were secreted, was discovered. One woman finding escape impossible, attempted to cut the throats of her three children, and so far succeeded as to kill one of them, and wounded the others severely. Six of the fugitives were apprehended; eight others effected their escape.

Mortality in London.—During the last quarter of the year 1855, there were 13,840 deaths from all causes in London. Of these, 3835 were from consumption and other diseases of the lungs.

New Orleans.—A company has been organized in New Orleans to build a ship canal from the Mississippi river at that city to Lake Bergne, by which vessels from the Gulf of Mexico may be enabled to reach the harbour without having to be piloted and towed all the way from the Delta. It is confidently expected that the whole sum required to construct the work, can be speedily raised.

The Emperor Faustin.—Advices from Cape Haytien to the 10th ult., state that the Emperor had returned to the capital from his unsuccessful expedition against the Dominicans, and that he was recruiting for another army to resume his operations.

A Cold Month.—According to the record kept at the Pennsylvania Hospital, the First month, 1856, was the coldest in the last thirty years, and 8° below the average temperature of the month during that period. The highest temperature during the month, was 40°; the lowest 5° below zero. At Paoli, the mean temperature of the month was 20°. On the 9th, the lowest of the thermometer was 10° below zero, and the highest 4° below.

A Bear Killed in a Town.—On the 16th ult., a large bear entered the town of Whitby in Canada West; he was soon attacked by men and dogs, and killed. Many of these animals have been seen in the neighbourhood, having been forced from their winter quarters by cold and hunger.

Volcanic Explosions in Arkansas.—Dry Creek Mountain, Arkansas, is said to be in a state of eruption sending forth smoke at the top, which at night has a r glare, visible for miles around.

The Price of Slaves.—At a recent sale in Halifax (ty, Va., one negro man brought $1410, and an $1425, both of whom were resold the same day advance of $50 each. These were considered ordinary field hands. A woman and two small chi brought over $1500.

The Tea Plant in Brazil.—The tea plant is said very successfully cultivated in Brazil, and will soo come an important article of South American comm In the province of San Paulo, the best quality now mands about 40 cents per pound wholesale, and poorer quality about 20 cents.

Settlers in Nebraska.—The Nebraska Legislature adopted a resolution requesting Governor Izard to ceed to Washington, and use his influence in ob ing the passage of a bill granting 160 acres of la actual settlers in that territory.

RECEIPTS.

Received from Jesse Hall, agt., O., for John W. S and J. Binns, jr., $2 each, vol. 29, for E. Sidwell, to 52, vol. 29; from J. Haines, agt., Pa., for J. McC $2, vol. 28, for Aaron McCarty, C. Ellwood and thony Kilmer, $2 each, vol. 29; from Nathan Li $2, vol. 29.

The Annual Meeting of the Auxiliary Bible Asso tion of Friends of Philadelphia Quarterly Meeting, be held at the Arch street Meeting-house, on Sec day evening, the 11th of Second month, at 7½ o'c The members of the Auxiliary and Friends intere in the distribution of the Holy Scriptures, are par larly invited to attend.

THE FRIEND.

A RELIGIOUS AND LITERARY JOURNAL.

VOL. XXIX. SEVENTH-DAY, SECOND MONTH 16, 1856. NO. 23.

PUBLISHED WEEKLY.

Price Two Dollars per annum, payable in advance.

Subscriptions and Payments received by

JOHN RICHARDSON,

AT NO. 50 NORTH FOURTH STREET, UP STAIRS,

PHILADELPHIA.

Postage to any part of Pennsylvania, for three months paid in advance, three and a quarter cents; to any part of the United States, for three months, if paid in advance, six and a-half cents.

Selected for "The Friend."

Freedom in China, Personal and Political.

The Chinese, submissive as they are to authority always find means of expressing their opinion, of bestowing praise or blame on their Mandarins. A very powerful organ of public opinion placard, and this is everywhere made use of the dexterity of long practice. When it is ed to criticise a government, to call a Mandarin to order, and show him that the people are intented with him, the placards are lively, cal, cutting, and full of sharp and witty sal- the Roman pasquinade was not to be compared to them. They are posted in all the streets, specially on the doors of the tribunal where Mandarin lives, who is to be held up to public diction. Crowds assemble round them; they ad aloud in a declamatory tone, while a thou- comments, more pitiless and severe than the are poured forth on all sides, amidst shouts ghter.

metimes, instead of the vehicle of opposition, omes a sort of national reward to those Mandarins who have made themselves popular. Their is replaced by pompous eulogy, and the idol people is likened to all the most famous holy ages of antiquity. The Chinese, however, ed much better in blame than praise, and their ds are much happier in insult than in eulogy. hinese are not in the habit of bowing beneath d of their master, so unresistingly as is ima- It may indeed be said, and it is to their , that they are in general submissive to authobut when it becomes too tyrannical, or merely olent, they sometimes rise up with irresistiergy, and bend it to their will.

ile traversing one of the western provinces, e day reached a town of the third class, named *Fang*, where we found the whole population mmotion, and wearing a very unaccustomed . We learned that the cause was as follows: ndarin had been named governor of the town, om the inhabitants did not approve. It was , that in the district he had just left, his istration had been arbitrary and tyrannical, hat the people had suffered much from his ice and extortion. The news of his nomino Ping-fang, therefore, excited general in- tion, which showed itself at first in the most t satirical placards. A deputation of the citizens set off for the capital of the province, sent to the Viceroy a humble petition to have n the poor people of Ping-fang, and not to hem a tiger, who would eat them up, instead ther and mother to take care of them. The petition was refused, and the Mandarin ordered to set off to take possession of his post on the following day.

The deputies returned, bringing this sad news to their fellow-citizens. The town was plunged into consternation, but did not confine itself to idle lamentations. The principal people assembled, and held a grand council, to which all the most influential citizens were invited. It was decided that the new governor should not be permitted to install himself, and that he should be civilly ejected from the town. The Mandarin arrived at the expected time, accompanied by a numerous suite, and, contrary to expectation, he encountered not the smallest sign of opposition on his way. Every one knelt at his approach, and paid homage to his dignity. He was convinced, therefore, that his fears of a bad reception were chimerical, and that all would go well. Scarcely had he entered the tribunal, however, before he had had time even to drink a cup of tea, it was announced to him that the chief citizens of the town requested an audience. He hastened to grant it, under the impression that they came to offer their congratulations on his safe arrival. The deputation prostrated themselves, according to the rites, before their new prefect; then one of them stepping forward, announced to him, with exquisite politeness, that they came in the name of the town, to request that he would set off directly to return whence he came, for they would have none of him. The prefect, thus rudely disenchanted, endeavoured at first to soothe, and then to intimidate the rebellious citizens, but all in vain; he found himself as the Chinese say, "only a paper tiger." The spokesman very calmly told him that they had not come there to discuss the matter; that the thing was settled, and they had made up their minds that he should not sleep in the town. In order to leave him in no doubt as to their real intentions, he added that a palanquin waited before the door, and that the town would pay his travelling expenses, besides providing a brilliant escort to conduct him safely to the capital of the province. It would have been impossible to turn any one out more politely. The prefect still endeavoured to raise objections; but a great crowd had gathered around the house, uttering cries of a far from flattering or reassuring nature, and he saw that it would be imprudent further to resist. He yielded, therefore, to his destiny, and signified his willingness to comply with their demand. With much respect and ceremony, he was shown to the door, where a handsome palanquin was in waiting, and requested to step in. The cavalcade immediately set off, still accompanied by the chief men of the town. On reaching their destination, they went straight to the viceroy's palace. The chief representative of Ping-fang presented the prefect to the viceroy, saying: "The citizens of Ping-fang restore to you this magistrate; as for this one, they will not have him at any price. Behold the humble petition of your children." Speaking thus, he handed to the viceroy a long roll of red paper, containing a petition signed with the names of all the most important people of Ping-fang.

The viceroy, with some appearance of dissatisfaction, took the roll, read it attentively, and then told the deputies that their arguments were advanced on reasonable grounds, and should be attended to; that they might return home quietly, and announce to their fellow citizens that they should soon have a prefect to suit them.

When we reached Ping-fang, the deputies had just returned, bearing intelligence of the perfect success of their bold measure. Such incidents are not unfrequent in the Chincse Empire. It often happens that energetic and persevering popular demonstrations oppose the evil administration of the Mandarins, and force the government to yield to public opinion. It is a great mistake to fancy the Chinese hemmed in by arbitrary laws, and quailing under a despotic power, which rules all their actions, and dictates all their proceedings. Though an absolute monarchy, moderated, indeed, by the influence of the educated classes, the people enjoy beneath it much more liberty than is generally supposed, and possess many privileges which we might vainly seek in some countries, boasting a liberal constitution. It has been written, and commonly believed, in Europe, that the Chinese are forced to follow the trade of their fathers; that no one can change the place of his abode without the permission of the Mandarins; in short, that they are subject to a host of restrictions, repulsive to the feelings of the European. We do not know what has given rise to these prejudices, for it is very certain that throughout the empire, each man follows the profession that suits him best, or none at all, without the government interfering in the least. Every man is free to please himself, to become an artisan, doctor, schoolmaster, agriculturist, or tradesman, without having need of a license or permission of any kind. As regards travelling, nowhere can there exist greater freedom and independence of motion; each citizen may wander about among the eighteen provinces, and settle where he pleases, undisturbed by any public functionary. No one interferes with the traveller, who is sure never to encounter a *gendarme* demanding his passport.

There is a law existing, which enjoins the Chinese to remain within the limits of the empire, and not to go vagabondizing among foreigners, acquiring bad habits, and destroying the fruit of their good education; but the numerous emigrations of Chinese to the English, Dutch and Spanish colonies as well as to California, prove that this regulation is not very strictly enforced. It is written in the Statute Book like many others equally disregarded. The liberty to traverse the various parts of the country unobstructed, is almost indispensable to those people, continually as they are engaged in commercial operations. Of course, the least impediment to free motion would check the great system of commerce, which is the life and soul of this vast empire.

The freedom of association is as necessary to the Chinese as that of locomotion, and they possess it as completely. With the exception of the secret societies aiming at the overthrow of the Mantchou dynasty, all societies are allowed, and the Chinese have a remarkable aptitude for forming them. There are societies for all trades and professions; robbers and beggars even have their associations; nobody stands alone in his sphere.

It sometimes happens that the citizens unite to watch over the observance of the laws in places where the authorities are too weak or too negligent to maintain order. We have ourselves witnessed efforts of this kind which were attended with very satisfactory results.—*Huc's Journey through China.*

For "The Friend."

Of making many books, the preacher says, there is no end; and while new works are written, they will probably be read. It is, however, certain that a man's life does not consist in the abundance that he knows, any more than in the abundance of his possessions. In the pursuit of useful knowledge, it is important to remember that there is one collection of ancient books, written under the revelation and authority of the Holy Spirit, of more value to us than all the rest besides. There is some danger of being so devoted to modern works, as to obliterate almost the recollection of the Holy Scriptures, or to abate the taste for them, so that they will be seldom read, or in so hasty and indifferent a manner, as to derive little benefit from them. They are however, a treasure, the value of which we cannot fully estimate; and the more men and women possess of spiritual practical religion, the more highly do they esteem them where they have access to them, and love to read and maintain their precepts and testimonics, through the aid of the Holy Spirit. On the contrary, where they are neglected and seldom read, we may fear that the love of religion and the work of salvation, are also much overlooked and disregarded; for the truly enlightened and obedient soul will be drawn to use all the helps and means within his reach which a gracious Creator has provided to advance the work of salvation. They were written for our learning that we, through patience and comfort of the Scriptures, might have hope. They are profitable for doctrine, for reproof, for correction and instruction in righteousness, that the man of God may be perfect, thoroughly furnished unto all good works, and are able to make wisc unto salvation through faith which is in Christ Jesus. Take care of lightly esteeming them, and setting them at naught.

Ancient Embankment of the Thames.—The embankment of the Thames, a most gigantic work, was, although we have no particular account, executed, or at least directed, by the Romans. Few of the thousands who enter the Thames think that the great stream on which vessels of the largest size are afloat, is in fact an artificial canal, raised in many places considerably above the level of the surrounding country. It is a wonderful work, and it is singular that we should have no record of its first execution. The artificial bank of the river extends, either on one side of the river or the other, almost from the Nore to Richmond in Surrey, and some judgment may be formed of its magnitude by the difficulty of repairing a breach made by a high and violent tide at Dagenham, in Essex. On this occasion (1707) a breach was made in this bank of the river of one hundred yards wide, and nearly twenty feet deep, by which alarming accident one thousand acres of rich land in Dagenham level were overflowed, and nearly one hundred and twenty acres of land washed into the Thames, forming a sand bank a mile in length, that extended over one-half of the channel. After several unsuccessful attempts, Capt. Perry, who had been employed in similar works by the Czar Peter, in Russia, at an enormous expense, and with much difficulty, completed a wall. It is difficult to estimate the advantages of the Thames embankment. After that was completed, many districts would be gradually gained from the waters; and Thorney Island, (the site of Westminster Abbey,) a small place, partly covered with scrubby bushes, and on which, at an early period, a hermit established his cell, extended in various directions. Southwark also increased; but then Lambeth, Vauxhall, and Battersea, now occupied by so many thousands, were under water, as was the greater portion of the land from Wandsworth to Woolwich, to Dartford, to Gravesend, and to Sheerness; and from the north range from Poplar to the Isle of Dogs. Scores of miles of that waste are now covered by multitudes, or converted into rich pastures or corn-fields.—*London Builder.*

For "The Friend."

Richard Jordan died in the year 1826, a few months before the adherents of Elias Hicks separated from the Society of Friends. In the course of his confinement, he several times mentioned his firm conviction at that solemn period, "that painful as is the present state of things amongst us to the true disciples of the Lamb, it would be made the means of purifying the Society of much of its dross—that such as stood faithful in their allegiance to Christ, would be deepened by it in the life of religion, and some of them would live to see the Society in a far better state than it now is. He had seen, he said, that the Lord would take the cause into his own hand, and none should be able to hinder him—that he would choose his own instruments, and those of this Society who had been highly favoured, but who had turned their backs, and forsaken him, would be cast out, and others brought in, who would stand for the honour of his great name, and for his cause on the earth." On the 18th of the Ninth month, a Friend being with him, he made some instructive observations on the situation of the Society, and with much tenderness of feeling mourned over the young and inexperienced, who were deluded by the fair pretences of some who were considered leaders of the people, and whom they had been accustomed to look up to as examples and instructors in the church, while these were taking advantage of the influence they had obtained to inculcate their pernicious principles, and infuse into the unsuspecting minds of their hearers, the poison of unbelief. For these unwary youth, thus exposed to the artifice of designing men, he manifested commiseration and sympathy. But he said he believed the time was coming, and perhaps was not far distant, when these false teachers would be fully exposed.

There were many, he remarked, who went under the name of Friends, that had never been convinced of, nor yielded obedience to the principles and doctrines of the Society, but had made a mere empty profession; and it was no marvel if such as these were carried off with the unsound notions which were now promulgated. He believed it had been permitted, in order to manifest such as these. As a Society, we were very impure, and needed much sifting to make us as we should be. But he was firm in the faith, *that the ancient doctrines and principles of the Society*, as set forth in the Holy Scriptures, *must and would prevail over all opposition*—that all those who were building on Jesus Christ, would be preserved amid all the storms and commotions which now agitate the Society, and that *it would yet arise and shine* in more of its ancient beauty, than many now living have ever seen it; adding, "I may not live to see it, but there are some of you that will."

"Great was the anxiety he evinced, that the friends of Christ and his holy cause might stand firm in a patient, persevering testimony *against every innovation, whether in doctrine or in discipline;* and by the steadfastness of their faith, the purity of their lives, and *the meekness and humility of their spirits*, evince that while they not strive *to carry party views and schemes*, felt themselves constrained by a sense of relig duty, *earnestly to contend for the faith once vered to the saints.*"

It is now nearly thirty years since the dea this eminent minister and servant of Jesus Cl and many trials and deep afflictions have bee dured, and a large number of faithful men women have been removed from within our ety, to an everlasting and glorious reward. its faith and principles are unchanged, th they have been assailed on the opposite hand, the prediction that they will prevail over all o sition, we believe, will be fulfilled. Many been swept away by the love of the world, at spirit of unbelief in departing from the living and fearful has been the condition in which have been landed. But the foundation, the l of ages, remains to be sure, and we hope the solid ground for the persuasion that very m are built, and building upon it. To the unsl bering Shepherd of the sheep, his cause, the vation of souls, is as precious as ever it was; the powerful convictions of his Spirit are ext ing to sons and daughters. Why are ye so f ful, O ye of little faith, that he will desert cause, and those whom he designs should be al and lambs of his fold and pasture. Let us stantly look to him to renew and increase our f and in the warming influences of the love of strive to cheer and encourage one another likewise, to wait upon him with our loins gir and lights burning, every one seeking to k his will, and in his strength to do it; and t the Society will arise and shine in its anc brightness, to the comfort of those who wait the consolation of Israel. This beloved and voted Christian closed one of his powerful t monies in this city, with this invitation, "C on, fellow soldiers; come on; the Lamb and followers will have the victory."

The London Post-Office.—The following in esting particulars, gathered from an article in last number of *Putnam's Magazine*, entitled "London Post-Office," will give some idea of the chinery by which this immense establishment is in motion. To the outside spectator little is seen except a plain, substantial stone building, s 400 feet by 130, supported by Ionic pillars, having a large hall for the accommodation of public; but it is one of the busiest places in great emporium, and the individual at its head under his direction an army of 20,000 pers There are employed in London 1385 letter carri for the accommodation of many of whom are vided rooms in the Post-Office building, wh they sort and arrange their letters. There 739 clerks, stampers, sorters, and sub-sorters gaged in the reception, delivery, and despatc the mails, which are so arranged that all let leave London, no matter in what direction, at same hours—nine in the morning, and nine in evening. Men on foot, on horseback, and in ca are constantly engaged, during the day, in coll ing letters from the various sub-offices; and induce publishers of newspapers to get their pa ready early in the day, mail carts are sent to t houses at certain hours to transport their pa to the central office. Each letter goes thro from ten to fourteen processes, and the won is, how 500 men can handle 200,000 with so li confusion and so few mistakes. A spectato always astonished at the rapidity with which letters are made to pass under the stamp. active stamper will stamp and count from seve eight thousand an hour.

For "The Friend."

Friendly Caution to the Young.

e of the sad consequences of the declension first principles, in some prominent members r religious society, and the promulgation of disaffection, is the perplexity and unsettle-, into which it is leading the inquiring minds r young people—who seeing those to whom have been accustomed to look for examples, ing, or lightly esteeming some of those dis-ve doctrines and precepts, which have long surely believed and earnestly contended for , are it is to be feared often found lightly ssing them in their social intercourse, to their ldetriment. While feeling tenderly for them, of whom seem wandering as sheep without pherd, and in danger of being scattered as in k and cloudy day, we would affectionately en-them, to pause and consider the fearful res-ility they may be incurring, by giving ex-on to skeptical thoughts on any doctrine of in which they have been educated—for how-light a thing it may appear to them in the f their youth and inexperience, the day may when such indiscretion may be to them the e of the most bitter and poignant reflections: may be brought to regard with astonish-and perhaps remorse, the levity and presump-rith which they meddled with sacred things, ven spake evil of dignities, and for all they were instrumental in disseminating the seeds soundness and schism.

fore venturing so thoughtlessly on things gh for them, may they apply to themselves uery, "Have I the evidence in myself, ving so done the will of God that I may of the doctrine? have I experienced that h in the blessed truth, through submission cross of my Redeemer, whereby I have at-to the stature of a strong man in him." y have not been so disciplined and clothed the heavenly armor, they will find it safe-retreat from the ground of controversy, and ard sacredly in their own hearts their and misgivings, looking to the Lord alone for nd direction, rather than darkening counsel rds without knowledge, among their juvenile ates, who have no more discernment than elves. It has always been one of the de-f the enemy of truth, to array against the of its holy principles, the inconsistent ex-s of many who profess to support them: ch instances are only evidences of human falli-the truth will stand though all men forsake it.

sympathizing with those who are stum-nd perplexed by these examples, we would ask whether they are themselves competent in all cases? perhaps some whom they may er as poor exemplifications of its efficacy may wed through the medium of prejudice; there e something distasteful to their nice ideas nement and propriety, which may veil their rom beholding them in their true character stian disciples. We may remember that the apostle Paul said of himself, that his bodily ce was weak and his speech contemptible, e him some of these, though unattractive in manners, may be as the savour of life unto life ir fellow believers, and be workmen well ap-l of their divine Master.

ough we would not plead for a mere hereditr traditional faith, yet if our dear young s would examine in an earnest, candid spirit, cords of our early friends, and carefully ob-the manner of their being enlightened to see nderstand these holy principles, and with undeviating integrity they were enabled to rt them through deep suffering and persecution, from the time of their convincement of their divine origin, until the end of their days, and how the vital energy of these principles has been gradually infused as a leaven beyond the limits of our society, they might be made to acknowledge their preciousness, and grow careful of making them the subjects of trivial discussion, and they might also be enabled to perceive, that in proportion as they are undervalued, or departed from, a spirit of compromise with the world and its false maxims gains ground.

May they then beware of "taking their flight in the winter season;" may they wait patiently to hear the voice of the true Shepherd, least they suffer themselves to be carried away from the fold, as many have been, with but a very superficial examination of the course they were taking, and of the ground they were leaving; willing captives of the seductive allurements of a profession of religion, which promised so many of the gratifications of this life as well as the hope of life eternal.

We doubt not, that many among other denominations of Christians are members of the true church, seeking to be the humble followers of their heavenly Master; for we know that he is no respecter of persons, and such is his love and mercy towards his creature man, that he condescends to our different estates, and often blesses the means used in his service, by the sincere in heart, to their comfort and strength, according to the light they have received; but to those who have really prized, and enjoyed our more spiritual and unincumbered manner of worship, and our comparative freedom from the wearisome fashions and customs of the world, the forms and typical ordinances and observances of other professions would be intolerably burdensome, and very much impede their spiritual progress; and to change our simple, scriptural faith for them, would indeed be like returning to the beggerly elements. Therefore we can hardly believe that such as go from us to them, have ever been deeply grounded in our faith and doctrines, or have known much, if any thing, of true vital heart-changing religion.

Shells.—Many shells naturally possess so fine a polish that no preparation is considered necessary for placing them in the cabinet. In general, however, it happens that when shells become dry, they lose much of their natural lustre. This may be very easily restored by washing them with a little water, in which a small portion of gum arabic has been dissolved, or with the white of an egg. There are many shells of a very plain appearance on the outside, by reason of a dull epidermis, a skin with which they are covered. This is removed by steeping the shells in warm water and then rubbing it off with a brush. When the epidermis is thick, it will be found necessary to mingle with the water a small portion of nitric acid, which, by dissolving part of the shell, destroys the adhesion. This last agent must be employed with great caution, since it destroys the lustre on every part exposed to its influence. The fine surface must be polished with leather, assisted with tripoli, but in many cases where even those are ineffectual, the file and the pumice-stone may be employed to rub off the coarse external layers, that the concealed beauties may be disclosed. When this is done, the labour and care, though great, have a reward proportionate.

The Wonders of Chemistry.—The strides which the science of chemistry has made the last few years cannot be otherwise than surprising to those unaccustomed to reading the scientific papers. Candles resembling the finest wax are now made from coal, and from the peat bogs of Ireland. Beautiful white paper is made from straw and pine shavings. Water can be frozen in a red hot crucible. Gutta percha and India rubber can be made as hard as steel. The offal of the streets and the washings of coal gas re-appear carefully preserved in a lady's smelling-bottle, or are used by her to flavour blanc manges for her friends. Marble, which rivals the finest Egyptian, is manufactured by a chemical process. Copper and iron have been detected in the blood of human beings. The action of nitric and sulphuric acid on cotton produces a substances more destructive than gunpowder. Diamonds and pearls are made by a chemical process.—*Farm and Shop.*

Epistle of George Fox.

As it was a time of great persecution, and we understood that in most counties, Friends were under great sufferings, either by imprisonments or spoiling of goods, or both, a concern was weightily upon me lest any Friends that were sufferers, especially such as were traders and dealers in the world, should hazard the losing of other men's goods or estates through their sufferings. Wherefore as the thing opened in me, I drew up an epistle of caution to Friends in that case, which I communicated to the Yearly Meeting, and from thence it was sent forth among Friends throughout the nation; a copy of which here follows:—

"Dear Friends and Brethren, in the Lord Jesus Christ, who is your only sanctuary in this day of storm and persecution, spoiling of goods and imprisonments! Let every one's eye be unto him, who has all power in heaven and in earth given unto him; so that none can touch a hair of your head, nor you, nor anything ye have, except it be permitted or suffered, in this day, to try his people, whether their minds be with the Lord, or in outward things. Dear Friends, take care that all your offerings be free, and of your own, that has cost you something; so that ye may not offer of that which is another man's, or that which ye are entrusted withal, and not your own, or fatherless' or widow's estate; but all such things settle and establish in their places. You may remember many years ago, in a time of great persecution, divers Friends who were traders, shop-keepers, and others, had the concerns of widows and fatherless, and other people's estates in their hands. And when a great suffering, persecution and spoiling of goods came upon Friends, especial care was taken that all might offer up to the Lord in their sufferings what was really their own, and not any other people's estates or goods which they had in their hands, and that they might not offer up another body's, but that which they had bought and paid for, or were able to pay for. Afterwards several letters came out of the country to the meeting at London, from Friends that had goods of the shop-keepers at London upon credit, which they had not paid for; who wrote to their creditors whom they had their goods of, entreating them to take their goods again. And some Friends came to London themselves, and treated with their creditors, letting them understand 'that they lay liable to have all that they had taken from them,' and told them 'they would not have any man to suffer by them: neither would they by suffering, offer up anything but what was really their own, or what they were able to pay for.' Upon which several took their goods again. This wrought a very good savour in the hearts of many people, when they saw such a righteous, just and honest principle in Friends, that would not make any suffer for their testimony: but what they did suffer for the testimony of Jesus should be really and truly their own, not other people's. In this they owed nothing to any but love. So, in this

every man and woman stands in the free offering, a free people, whether it be spiritual or temporal, which is their own, and in that they wrong no man, neither inwardly nor outwardly, Ornan said unto David, 'I give thee the thrashing floor, &c., and the oxen for burnt offerings, and the thrashing instruments for wood, and the wheat for the meat offering; I give it all.' But King David said unto Ornan, 'Nay, but I will verily buy it for the full price; for I will not take that which is thine for the Lord, nor offer burnt-offerings without cost.' 1 Chron. xxi. 22, &c. So it should be his own, and so should it be every man's that offers. You may see here that David would not accept of another man's gift for an offering to the Lord; he would not offer up that which cost him nothing, but what should be really his own. Psal. cxii. 5: 'A good man will guide his affairs with discretion.'

Let this be read in your Monthly and Quarterly Men's and Women's Meetings. G. F.

London, the 2d of the Fourth mo., 1683.

Early Anti-Slavery Advocates.

(Continued from page 173.)

BENJAMIN LAY.*

In preparing an account of this eccentric philanthropist, some difficulty has arisen from a desire to do justice to his motives, whilst setting forth conduct, unjustifiable and contentious. He had, without doubt, a ready wit, a quick apprehension of things, and an aptitude in laying hold of good illustrations of his meaning; but his mind was not well balanced. His appreciation of the spirit of the gospel, and of the various duties it called for from the disciple of Christ, was clear, but his feelings were warm, and influenced his actions more than his judgment, and if his views found not quick entrance into others, his zeal kindled into fierceness and sometimes into frenzy.

He was born in Essex, England, according to the Colchester records, in the year 1681. His parents were in membership with Friends, and he was brought up in the attendance of the meetings of our religious Society, and instructed in the spiritual nature of the gospel dispensation. From his own account, he received but little education in his youth, yet from his fondness for introducing Latin quotations in his writings, we may safely conclude that in his after life, he made himself somewhat acquainted with that language.

His biographer informs us, that when quite young, he was placed with a glove-maker as an apprentice, with whom he continued for a time; but long before his maturity, he left his master. Whether this was by mutual consent, we know not, but it probably grew out of the infirmity of his own temper. He then went to reside on a farm, "in the tenure of his brother." From his own account, his brother employed him to keep his sheep. This was an innocent and healthy occupation, and he thought it "a very beautiful and comely sight to see the pretty lambs and their dams quietly and sweetly feeding together." This was probably in 1697. He was not satisfied with his condition, and soon afterwards went to sea. According to his own statement, he was for eighteen months on board a large vessel of 400 tons burden, which sailed to Scanderoon, in Turkey. This was in and about the year 1701. Among the crew there were four men, who had been seventeen years slaves in Turkey, and who gave him an account of their servitude. Either from these men or from others in the ship, he had an account about the same time of the atrocious manner in which the slave vessels obtained their living cargoes on the coast of Africa.

These accounts were stored up in his memory, and afterwards made use of, although at that time they do not appear to have awakened any particular feeling against the African slave trade. Whilst the vessel was at Scanderoon, he is supposed to have travelled through Syria, for he in his later years often stated, "that he had visited the memorable spot, where the Saviour of the world conversed with the woman of Samaria, and had refreshed himself by a draught of water from Jacob's well." He continued a sea-faring life, at first, he says, as a "common sailor," afterwards, it is probable, in some other capacity, until about the year 1710. He had probably laid by some property, and soon after his leaving the sea, he married Sarah ——, of Rochester, in Kent. His residence was at this time, or soon afterwards, in London, where it is believed he was engaged in storekeeping. Benjamin Lay appears to have been, in the common concerns of life, very exemplary, one who felt keenly for the sufferings of others, and a consistent member of the Society of Friends. His wife, too, was a minister of the gospel, well approved and beloved for her work's sake.

After the accession of George the First, which took place on the 20th of the Eighth month, 1714, Benjamin Lay, who had a strong testimony against worldly minded priests and men preaching for gain, obtained admittance to the king, and presented him with a copy of Milton's pamphlet, entitled "Considerations touching the likeliest means to remove hirelings out of the church."

In the year 1717,* he was disowned from the Society of Friends, by Devonshire house Monthly Meeting, in London. We have, in this country, no means of ascertaining the charge against him; but it has been generally supposed, that it grew out of his violence in the party debates of that day. They had fierce whig and tory disputes, the supporters of the Guelphs, and of the Stuarts. To which party B. L. belonged, of course we know not, nor how his zeal for either should have brought him into conflict with Friends.

In 1718, he had with his wife removed to Barbadoes, and entered into mercantile business there. From the cruelty he saw inflicted on the slaves in that island, he was that year convinced, he says, of the "hellish practice of slave keeping." Of his residence in this island, he wrote, Eighth mo., 1736, "When I lived in Barbadoes about eighteen years ago, where we had much business in trading, the poor blacks would come to our shop and store, hunger-starved; almost ready to perish with hunger and sickness. Great numbers of them would come to trade with us, for they seemed to love and admire us, we being pretty much alike in stature and other ways. My dear wife would often be giving them something for the mouth, which was very engaging, you that read this may be sure, in their deplorable condition. Oh! my soul mourns in contemplating their miserable, forlorn, wretched state and condition that mine eyes beheld them in there. And it is the same now, and will remain except the great Almighty Being, either immediately or instrumentally, shall be pleased to put a stop to it; for they are yearly by ship-loads poured in upon, and received by the people, many thousands in one y as is thought, up and down America."

He goes on to say that his wife, who was a der-hearted woman, was often giving the sl the spoiled biscuit, and the meat and fish, wh in that warm country was soon tainted. She deavoured to give to those who needed it n yet he says all wanted, "except here and the favourite slave, one of an hundred or thous maybe kept for their glory and pride, to wait them, amongst their proud, lazy, dainty, tyra cal, gluttonous, drunken visitors." After feed those in the house, his servants would take throw some into the streets, and the negroes wo run and scramble fiercely for a share, half spoi as it was. Benjamin says, "I never saw a pa of hounds more eager about a dead carcass th they were." These scenes took place on the f day of the week, when the negroes were at libe from farm work.

The outward person of Benjamin Lay was v peculiar. "He was," says R. Vaux, "only f feet seven inches in height; his head was large proportion to his body; the features of his f were remarkable, and boldly delineated, and countenance was grave and benign. He hunch-backed, with a projecting chest, below wh his body became much contracted. His legs w so slender, as to appear almost unequal to purpose of supporting him, diminutive as frame was, in comparison with the ordinary of the human stature. A habit he had contract of standing in a twisted position, with one he resting upon his left hip, added to the effect p duced by a large white beard that for many ye had not been shaved, contributed to render h figure perfectly unique. It is singular, that wife very much resembled him in size, havin crooked back like her husband."

The similarity of their persons, and their uni acts of kindness to them, made the slaves rejo to see them together. Benjamin says, "We w so very much alike; [they] would lift up th hands with admiration, and say, 'That little backa man,' for so they call white people, 'go all o world, see for that backarar woman for hi self.'"

Although Benjamin Lay would never hold slave, and although he was, he says, "sor grieved to see and hear the inexpressible cruel torture and misery, these poor wretches were are put to," yet he felt the spirit of slavery, a the associations around him influencing his c duct in some things. He says, "For want dwelling near enough to the blessed Truth, I w leavened too much into the nature of the peo there, which are masters and mistresses of slave He goes on to show how the spirit manifested it in him. The negroes would come to his shop great droves, as having laid, as he supposed scheme to rob him. They would all be impati to be served, and, whilst he was busy, would st whatever they could lay their hands on. For t when he caught them at it, he sometimes g them stripes.

His wife seeing the danger they were in of ing leavened into the very nature of the inhal ants, pride and oppression, was willing and de rous to leave the island, and Benjamin ad "Indeed, so was I."

Among the things conspiring to make th anxious to leave Barbadoes, were two examples notable cruelty One witnessed by his wife. T other was the case of a black slave whose mas always whipped him on Second-day morning. at last declared he would bear it no longer, hung himself on a First-day evening.

(To be continued.)

* On comparing the facts which I had gathered from ancient records respecting B. Lay, with the biographical sketch of him prepared by the late Roberts Vaux, I found many discrepancies, particularly as respects dates. Traditional gossip often leads astray.

* I take the year of disownment from R. Vaux. A certificate he brought from Colchester to America, in 1732, states that the occasion of offence was given "to Devonshire house Meeting."

For "The Friend."

feel disposed to pen a few lines for the en-
agement of those, wherever their lot may be
who are bowed down in consideration of the
state, into which our beloved Society has fallen.
is truly a mournful time with many of these
cised ones, and were it not, that, at seasons,
re permitted to feel and believe, that His
asting arm is underneath, to sustain and sup-
all who put their trust in him, such as feel
sorely tried, would be pressed down beyond
ure; but blessed be the name of the Lord,
as promised to be with even the two or three
ever they may be, if gathered in his name,
h is his power. May we, then, be truly con-
ed to feel this power to be the motive to, and
authority for, all action, either as relates to
elves individually, or in regard to any part we
take in matters concerning the church; re-
bering that those who served the Lord form-
were "troubled on every side, yet not dis-
ed; perplexed, but not in despair; persecuted,
not forsaken; cast down, but not destroyed."
efore take courage, for no new thing has hap-
d; but the tribulated path is the same in
h all who have gone before, have had to walk
e cumbered with the shackles of mortality,
who, we fully believe, are now enjoying the
ence of the Lord, and singing praises, high
es to his worthy name forevermore.
lthough the sensible presence of him whom
esire to serve and follow, may, for a long
, be withholden, let us endeavour to walk by
, patiently abiding his time; and most as-
lly as faithfulness is adhered to, in his own
he will fulfil his promise unto those who seek
with the whole heart, for "he hath not said
the seed of Jacob, Seek ye me in vain:"
hath extended the invitation, "Come unto
all ye that labour and are heavy laden, and I
give you rest. Take my yoke upon you, and
of me; for I am meek and lowly in heart:
ye shall find rest unto your souls." There-
be not cast down beyond measure, for I be-
many times the adversary of our soul's peace
an entrance in this way, when he has been
l while presenting himself as "a roaring lion,
ng whom he may devour."
t it behooves all that would live godly in
st Jesus, to be on the watch, both for the in-
tions of the Captain of our soul's salvation, as
hat he would have us to do, as well as seek-
or his aid to discern the twinings of our arch-
y, who promises great things unto all that
follow him But we may remember, he is
red to have been a liar from the beginning,
he is so yet: therefore, under whatsoever
formation he may endeavour to entice, be
through the assistance of "Him, who was
r foiled in battle," to say, "Get thee behind
Satan, thou art an offence unto me: for thou
rest not the things that be of God, but those
be of men." If he was permitted to insinuate
elf with his counsel into the immediate pre-
e of our blessed Lord, it shows the great ne-
y for us to be on the watch at all times;
at I say unto you, I say unto all, watch."
ns, therefore, strive to be on our guard that
nter not into temptation.

o, Second mo., 1856.

ne Colour of Copper.—Our copper is all of a
ppearance, but is this the natural colour of the
l? Like diamonds, may it not have a variety
lours, such as "red and white." In China
is plenty of white copper; this has generally
believed to be as pure a metal as the red. A
spondent of the London Mining Journal, how-
ever, throws some more light on this matter than has been possessed hitherto. He states, that when raised in the mine, in a particular district of China, the ore from which it is made is of a red colour, but by a peculiar method of treating it in smelting, and the addition of 1¼ per cent. of tin, it becomes white. The metal is common in China; is of a beautiful fine grain, and harder than red copper; this, no doubt, is due to the admixture of tin.

Selected.

THE SLEET.

Awake, awake, the sun is up; awake and sally forth,
We've had a rain of jewelry from out the frozen north;
The earth is robed in dazzling white, each tree is hung with gems,
And diamonds in ten thousand shapes are hanging from their stems.

Each bush and every humble shrub, with precious stones is strung,
And all the purest, brightest things, by handsful round are flung;
The em'rald, and the amethyst! the topazes! behold!
And here and there, a ruby red, is sparkling in the cold.

The chrysolite and jasper see, and that bright sardine stone,
The holy Patmos prophet saw, upon the heavenly throne.
Here all the gold of Ophir shines, with all Golconda's store,
And who could ever number up the countless myriads more?

The holly in its darkest green, with crimson fruit looks gay,
Enchased in solid silver too, how rich is its display!
In green and gold the shaggy pine seems almost in a blaze,
With all the sun's reflected light, yet softened to the gaze.

The cedar! O, thou favoured tree! in Scripture it is told,
They laid thee in the house of God, and cover'd thee with gold!
But great as was King Solomon, he, nor the house he made,
Were dressed in such magnificence as thou hast here displayed!

The beech tree stands in rich array of long and shining threads,
Its brittle boughs all bending low to earth their drooping heads,
And now and then some broken limb, comes crashing from on high,
And showering down a world of gems that sparkle as they fly.

The lofty oak, the hundred limb'd Briareus of the trees!
Spreads out his pond'rous icy arms loud crackling in the breeze,
And as the roused up lion shakes the dew-drops from his mane,
So does the woodland monarch shake his crystals o'er the plain.

But time would fail to tell of all that bright and starry host,
The north wind brings to witch the world from out the realms of frost;
The meanest thing—the most deformed—the dry and sapless bough,
The bramble wade, the rugged thorn, are pure and spotless now.

Ye counsellers of earth! come forth, ye princes who have gold,*
Your diadems, ye kings! bring here the jewelled crowns ye hold;
Come woman in thine ornaments, in all their costly sheen,
And let them be the loveliest ones that ever graced a queen.

This grass that's under foot, this weed with branching arms,
Thus glistening in the morning sun, bath fifty-fold their charms;

Then cast your baubles vile away, and bend in solemn thought,
To Him who has this gorgeous scene from storm and tempest wrought.

Yet this fair pageant soon must fade before the breath of noon;
And by the fiat from on high, your wealth shall fade as soon.
O! lay not worthless riches up, which "moth and rust" assail,
But those which at the judgment day, through Christ, will then avail.

What, though the sun so soon must melt this frost-work and its forms,
He speaks them into life again, who rides amid the storms;
So, in the twinkling of an eye, at his last trumpet dread,
With bodies fashioned gloriously, shall we rise from the dead.

The sun goes up his destined way—how few do heed my calls!
In tears the vision melts away, the baseless fabric falls;
I, too, could shed some tears, alas! that this sweet scene is passed,
For scenes as sweet, it brings to mind, which fled away as fast. *St. Leger Landon Carter.*

* Job, chapter iii.

Geological Survey of New Jersey.

We find in the Newark Daily Advertiser a very long abstract of the voluminous reports of the Geological Survey of the State of New Jersey, from which we obtain the following facts. The working force of the department consists of one superintendent and geologist, W. Kitchell, one topographical engineer, E. L. Viele; one assistant geologist, George H. Cook; one chemist, H. Wurtz; one paleontologist, James H. Hall; and from twenty to thirty assistants engaged in the field operations. The geological department of the survey is in a condition to be completed and reported upon finally by counties, as rapidly as the topographical maps are finished, but since the termination of the field labours, on the 1st of Twelfth month, there has not been time to arrange the materials for a report. About three thousand specimens have been collected for the State and county cabinets, and are ready for arrangement. Some of the maps are in progress of engraving, and cuts have been made from original drafts. The expenses of the department last year were $17,918 61, and the estimate for the ensuing year is $25,000, included in which is $5000 for drafting and engraving. This will be sufficient to prepare the maps and cuts for at least three or four counties, in addition to the progress of the field work throughout the greater part of the State, and the superintendent recommends that arrangements be made for the disposal of the work, gratuitously or by sale, to place it in the hands of the people.

The topographical department has been engaged in making a complete and accurate physical map of every county in the State, exhibiting all the features of its surface. From it we learn that the exact area of the State is 7,750–93 square miles, or 4,960, 595–20 acres, of which aggregate 1,767,-991 acres are improved, leaving a residue of 3,192,-604–20 acres of unimproved land. The total value of the farm land is $120,137,511. The Blue Mountain, which is the most elevated range in the State, is thirty-five miles in length, and has an average height of 1400 feet. At the Delaware Water Gap it is half a mile wide and fifteen hundred feet high. The Highlands of New York extend into New Jersey in a succession of parallel ridges, in which lie several large and beautiful lakes. There also are the sources of the Raritan and Passaic rivers. South of a line drawn from Amboy to Trenton, the State is almost a level plain, forming a striking contrast to the northern part;

and the streams there are so sluggish that in many places they resemble a succession of swamps and ponds. The total length of the completed railroads, in the state is 504 miles. Reconnoisances have been made at Paterson, Trenton and Newark, to locate standard meridian lines, and some of the monuments have been prepared. It is expected to designate such lines in the spring in every county, as a guide for local surveyors. The southern division of the state is remarkable for its entire lack of rock formations. Three marl beds are described in the report, and those are shown to be the best fertilizers which possess the most phosphoric acid. The first and lowest marl bed has been traced from the sea shore, across Monmouth and Burlington counties, to Burlington, and across Gloucester and Salem counties to near the Delaware river. The second bed has been traced across Monmouth, Ocean, Burlington, Camden, Gloucester, and Salem counties, and the third from Squankum, across Ocean and Burlington counties, to Clementon, in Camden county, beyond which no trace of it is found. At Woodbridge, Middlesex county, great quantities of pipe clay are dug, and some fire clay. In the potter's clay, at South Amboy, a single tree has been followed up for ninety-three feet, having a diameter of five feet at the large end. In some places the clay is white, with a faint buff hue, and is used for making satin faced paper hangings. Shell marl is found in several places and in it specimens of shells identical with those now growing in Delaware bay and the ocean. On Stoe creek, in Cumberland and Salem counties, oyster shells are found at considerable depth, and fossil shells and bones are abundant. The Cape May diamond is described as probably a water worn quartz crystal. Agates are not uncommon there. Last spring the skull of a Mastodon was dug up in a meadow near Pemberton, Burlington county, and other bones have been found near it. The sea coast of the state wears away rapidly in consequence of the continued settling or subsidence of the land. Professor Cook is confident that the shore is now settling at the rate of about two feet in a hundred years. At Cape Island on the Atlantic shore a full mile has been worn in since the Revolution. The sand beaches on the coast are drifting inward every year. One beach has moved fully one hundred yards during the last twenty years. At the mouth of Dennis' Creek, and for several miles along the bay shore in Cape May county, the marsh wears away at the rate of a rod in two years. Egg Island, the western point of Maurice River Cove, which in the year 1694 covered three hundred acres, now contains at low water from a half to three fourths of an acre, and at high water it is submerged. At Town Bank the solid gravel wears away at the rate of about a foot a year, and water covers the ground where houses once stood.

For "The Friend."

Cold Weather in Iowa.

We take the following extract from a letter received from a correspondent, dated Iowa, Second mo., 1st, 1856. "Among the unnumbered blessings of a gracious and merciful Providence we in this land have been favoured with one too little prized, and for which therefore but little gratitude is felt by many, who are enjoying it, that is, good health, which has been general here for a length of time past. So far, we have had a remarkable winter for this latitude,—both the severity and continuance of cold weather Since the 21st of the Twelfth month, there has not been a day in which the mercury rose to 32° Fahrenheit, at the time in which I take my notes, which are just before sunrise and between 12 M. and 1 P. M. For seven teen days the mercury has been below zero in the morning, and for seven, below at noon. Our coldest weather was in the First month, as fol lows:—7th of the month, morning, 19° below zero—noon, 12° below zero; 8th, morning, 25° below zero—noon, 18° below zero; 9th, morning, 26° below zero—noon, 8° below zero. It was 20° below zero on the morning of the 10th, but rose to 2° above by noon. About five inches of snow fell the 29th of Twelfth month, at which time there was on the ground, say one inch; it has snowed from half an inch to an inch at different times since; but last First day, the 27th ult., there fell about four inches more.

For "The Friend."

"Them that honour me, I will honour."

As this is the season when many of our young friends are tempted to collect into large companies, I have been led to reflect on the subject as one of serious importance; and if I could present it in a different light than that they have hitherto viewed it, or if only one precious mind should be strengthened to withstand the temptation, it will be enough. Many, no doubt will be ready to answer, we are social beings, and that it is an innocent way of spending a few hours; what evil is there in it? So we were intended to be social beings, yet those who are endeavouring to walk circumspectly redeeming the time, take a very different view of it. For if we meditate on the solemn language of the apostle, "That if the righteous scarcely be saved, where shall the ungodly and sinner appear?" that if those who are watchful, keeping the fear of the Lord always before them, and honouring Him in all their movements in humility and abasedness of self; if these only are accepted, where shall those appear who live as they list, passing their days in the enjoyment of those things that perish with the using? For such as we sow, such shall we reap; if we sow to the spirit, everlasting life; but if to the flesh, we shall reap corruption. And who of us would not wish to enjoy everlasting life and be partakers of the pleasures at the Father's right hand? But how can we hope to obtain them, if we are indulging in that which gratifies the carnal mind: if we are in conduct saying "we will eat our own bread, and wear our own apparel," and unwilling to acknowledge Him in all our ways; or in action cannot adopt the solemn appeal, "Thou, Lord, secst me." And in returning form these large gatherings, do you feel that sweet peace that would be the reward of well spent time, but contrawise do you not lie down in sorrow, and does not confusion cover you?

Ah, then, my beloved young friends, towards whom we are looking for a succession of standard bearers to uphold the precious testimonies so dearly purchased by our worthy predecessors, did you take into view the shortness and uncertainty of life and the importance of improving every gift and talent to the honour and glory of the great Giver, and the awfulness of being summoned unprepared to appear before Him who said to those who did not minister unto him "Depart from me, I know you not," I believe you would not be found employing your precious time and talents in any thing that was not comparable to laying up treasure in Heaven.

THE FRIEND.

SECOND MONTH 16, 1856.

Our readers may recollect that in the course of the proceedings had before Judge Kane, of the U. S. District Court in Philadelphia, relative t coloured woman and her children claimed by J Wheeler, the Judge took occasion to express opinion that there was no law of this State i fering with the right of slaveholders to carry slaves into and through it, or prejudicing t title of ownership by their so doing; and that right of transit through free States was secure the law of nations, &c. Some of the membe the political party in Pennsylvania, with w the Judge is understood to be identified, not s fied with the mere expression of a judicial o ion, are desirous to have a law passed by our l lature securing to slave owners the right to b their slaves into and through the State; and cordingly a petition has been presented in Houses at Harrisburg, praying for the enactm of such a law. The majority of the Judic Committee of the House of Representatives m a report, in which they declare that this right transit through Pennsylvania is already sect to the citizens of the slaveholding States, by law of nations and the Federal Constitution; that no statute of this State affects to disturb right. The grounds upon which this declara affects to be founded, are the flimsiest assumpti we can now recollect to have seen recorded in report of a legislative committee, and there hardly be said to be a show of argument from beginning to the end of the report. We give report of the minority of the committee in f and from it our readers will gather the poi assumed by the majority.

"The undersigned, members of the Judici Committee, being unable to concur with the jority of said committee in the views and pri ples set forth in their able and learned report, the petition of Col. Joseph Paxton, of Catawi praying the Legislature 'to enact a law secur to the citizens of slave holding States, who m pass through this Commonwealth, or transien sojourn therein, with their slaves, all the rig of property in said slaves guaranteed to them the laws of any other State, and making it a pe offence to attempt by word or deed to decoy, or any manner to alienate the said slaves from th said owners, against the said owners' will,' f that it is due to themselves, as well as to people of this Commonwealth, that they sho set forth the grounds of their dissent. We not concur with the majority, 'that the ri of transit through Pennsylvania, with their slav is already secured to the citizens of the slave ho ing States, by the law of nations and the Fede Constitution, and that no statute of this St affects to disturb it.' Neither can we yi our assent to the reasoning and doctrines ge rally laid down in the report of the majori We do not propose to advance any views in c flict with the vested rights of the slave-holdi States, to impugn the compromises of the Con tution, or to enter into any of the vexed questi growing out of Congressional legislation on subject of slavery; much less do we intend to c cuss the great moral and political evils of slave from which this Commonwealth has been happ exempted by the humane and enlightened legis tion of the past, gradually removing this pernici institution by a cautious and progressive series acts, from the soil of Pennsylvania. We shall c fine our remarks to the points in which we di from the majority.

"1st. We hold that slavery is exclusively local institution, and that it is not recognized the law of nature, the common law, or the c law. Such is the opinion of the ablest writers jurisprudence. Blackstone in his Commentari vol. 1, p. 42, says, 'upon the law of nature

aw of revelation depend all human law; that say, no human law should be suffered to con ct these. The law of England abhors and not endure the existence of slavery within nation. A slave or negro, the instant he lands ngland, becomes free.' 'When a slave comes in the exclusive jurisdiction of England he is to be a slave, because the law of England ively and notoriously prohibits and forbids xistence of such a relation between man and ' This was admitted and so expressed by Webster, as Secretary of State, in his corres- ence with Lord Ashburton, in the Creole case. ster's works, vol. 5, p. 315. The civil law the same view of slavery, and declares it to gainst the rights of nature. Inst. Lib. 1, tit. c. 2. Vatel's Law of Nations, book 2, chap. When our forefathers migrated to this country brought with them the common law of and, and it has become the basis of all our

2d. We hold it to be equally clear that the of slave-holders to pass through or sojourn is State, with their slaves, is not conceded by aw of nations. We have already shown that om is the birthright and the natural condition an. Story, in his Conflict of Laws, sec. 104, : 'Personal disqualifications not arising from aw of nature, but from the customary or posi- law of a foreign country, especially such as of a penal nature, are not generally regarded ther countries, where the like disqualifica- do not exist. They are strictly terri- l. So the state of slavery will not be re- ized in any country whose institutions and y prohibit slavery.' The law of slavery *invitum*, and when a slave gets out of the ory where it prevails, and out of the power s master, and gets under the protection of an- power, without any wrongful act done by the giving that protection, the right of the mas- which is founded on the municipal law of the cular place only, does not continue. 'The of a slave being taken to a country where ry or involuntary servitude is not tolerated, tes on the condition of the slave, and pro- s immediate emancipation.' 16 Louisiana 489; 7 Louisiana Rep. 172. Slavery exists by virtue of the laws of the state where it is ioned; and if the slave escape from such state free state, he is free, according to the princi- of the common law, and re-capture in a free is authorized only by the Constitution and f Congress. There is no general principle in aw of nations which requires such surrender s vs. Vansant, 2 M'Lean, 596. By the law tions no state is bound to recognize slavery other state, 16 Peters, R. 539, or the state very, as to foreign slaves found within its orial dominions, when it is in opposition to its policy and institutions, in favour of the sub- of other nations. The state of slavery is ed to be a mere municipal regulation, founded and limited to the range of territorial laws. eters, 611. And it is well settled with re- to their municipal regulations, that the al States of this Union are to each other gn. 2 Wash. 298. It appears, therefore, by the law of nations the slave holder would no right to pass through our state with his s; nor is he entitled to exercise that right by comity of nations. For it appears to be as well as settled, that that which is called *as, inter communitates*, comity between states tions, cannot prevail in any case where it es the law of our country, the law of nature e law of God. Forbes vs. Cochran, 2 Barn. ess. 463. It has been clearly shown by the above authorites that slavery is against the law of nations, and we shall presently show that it is also against the laws of Pennsylvania.

"3d. Is there such a right recognized in the Constitution of the United States? The clause of the Constitution cited by the majority of the committee, under which this alleged right of transit with slaves is claimed, is Article 1st, sec. 8, part 3: 'Congress shall have power to regulate commerce with foreign nations, and among the several States, and with the Indian tribes;' and Article 4, sec. 2: 'The citizens of each State shall be entitled to all the privileges and immunities of citizens of the several States.'

"Chief Justice Marshall, in the case of Gibbons vs. Ogden, 9 Wheaton, 195, in construing Article 1, sect. 8, p. 3, of the Constitution, and the power of Congress to regulate commerce between the States, says; 'The genius and character of the whole Government seems to be, that its action is to be applied to all the external concerns of the nation, and to those internal concerns which affect the States generally, but not to those which are completely within a particular State, and which do not affect other States, and with which it is not necessary to interfere, for the purpose of executing some of the general powers of the Government. The complete internal commerce of a State, then, may be considered as reserved to the State itself.' It has been clearly shown that slavery is local, and purely the creature of municipal regulation; that it is looked upon with disfavour, and is not recognized by the common law, the law of nations, or the law of nature. This clause of the Constitution gives Congress the right to regulate commerce; and if the construction put upon it in the report of the majority be correct, then Congress has the right to regulate commerce in slaves between the States, and the buying and selling of men in our public markets. This is certainly a novel and extraordinary construction of this clause of the Constitution. On what authority it is based, we are not informed, as none is cited. That the master's claim to the service of his slave, and to a species of property in him, has been recognized by our courts and judicial tribunals, cannot be denied; but that right is essentially different from his right of property in inanimate things and domestic animals. His right to the former depends on arbitrary, local law, and is in violation of man's natural rights; but his property in the latter is acknowledged by the laws of nature and the laws of God. The laws that regard slavery as property, are local, and only apply so far as such laws can operate. Such laws do not make them personal property generally. 18 Pickens' Rep. 216. The 4th Article, sec. 2d, of the Constitution, is believed to be still wider from the mark, and to have no more reference to slavery than to the power to make war. But it secures to citizens of each State the right of ingress, egress and regres sinto the several States of this Union; and while there, the same immunities, under the laws of the State, that citizens of the same State enjoy under the laws thereof.

"But the citizen does not carry with him, the laws of his domicil, into a sister State. The moment he crosses the line of Virginia into this State, he is under the laws of Pennsylvania and not the laws of Virginia. See 4 Johns. C., 430, 2 Kent's Com., 258. And if he brings his slaves with him, the moment they cross the line they are free. But it has been decided that the 2d section, Article 4th, of the Constitution of the United States does not extend to the case of a slave voluntarily carried by his master into another State, and left there under the protection of a law declaring him free. Butler vs. Hopper, 1 W. C. R., 499. There is nothing in the letter or the spirit of the Constitution that will justify the right claimed under it, nor has the Supreme Court of the United States, nor even our State courts, so far as we have been able to ascertain, ever given it such a construction. By the act of this Commonwealth, passed 1st March, 1780, for the gradual abolition of slavery, it is provided that all negroes, mulattoes and others born within this State, after the passage of the act, should be free. By the act of 3rd March, 1847, section 7, so much of the act of the 1st March, 1780, as authorizes the masters or owners of slaves to bring and retain such slaves within this Commonwealth for the period of six months in involuntary servitude, or for any period of time whatever, be and the same is hereby repealed. It has been decided that a slave brought into this State, since the passage of the act 3d March, 1847, is *ipso facto* free. Pierce's case decided in Common Pleas, Philadelphia, in 1848. The rule of the common law of England, in regard to slavery before the Revolution, became the common law of Pennsylvania, except so far as modified by the Constitution of the United States The fugitives were free the moment they touched the soil of Pennsylvania; all the incidents, accompaniments and attributes of bondage fell from around them. Kauffman vs. Oliver, 10 Barr, 517.

"If this right of transit with slaves is incorporated in the Constitution itself, then all State laws prohibiting the introduction of slaves would be unconstitutional, and consequently void. But several of the States of this Union have enacted just such laws, and they have been passed upon by the Supreme Court of the United States, and their validity has never been doubted. Slaves brought into the State of Maryland in violation of the laws of that State, are declared to be free. Rhodes vs. Bell, 2 How. Rep. 405. 16 Peters' R. 611. Thomas vs. Generis, 16 Louisiana Rep. 488. 5 Leigh, 615. 10 Leigh, 697. 9 Gill. & Johns. 19. 11 Louisiana Rep. 500. 10 How. Rep. 87.

"The right to pursue and recapture fugitive slaves escaping from their masters into a free State, is not raised by the petition referred to the committee, and has not been noticed in this report. The seventh section of the act of March 3, 1847, having expressly repealed the provisions of the act of March 1, 1780, authorizing the masters or owners of slaves to bring and retain such slaves within this Commonwealth while temporarily sojourning here, and said act never having been pronounced unconstitutional by any federal tribunal, the undersigned do not deem it expedient, on any ground, to disturb it. We are satisfied that the abrogation of this section of the act of 1847 would lead to sectional discord and domestic disturbances, and that our friendly relations with the citizens of the southern States, as well as our own peace and tranquillity, will best be maintained by the denial of the prayer of the petitioner.

"S. P. M'Calmont."

SUMMARY OF EVENTS.

EUROPE.—The new steamship Persia arrived at New York on the 9th inst., with European news to First mo. 26th. The Pacific which sailed from Liverpool on the 23d ult., had not arrived on the 11th inst. The Persia brings intelligence of further progress towards peace. Orders had been transmitted from St. Petersburg to the Russian army in the Crimea, to suspend hostilities until the result of the approaching negotiations should be known. It was not expected that the united agreement to negotiate, would be signed by all the parties until the

2d or 3d inst. It was presumed that an armistice would then be agreed upon. No place had been fixed for the meeting of the Conference. Count Nesselrode has addressed the representatives of Russia in foreign Courts, declaring that Russia has made concessions with a view to the re-establishment of peace, out of deference to the representations of friendly powers, and not because the interests of Russia call for the conclusion of that peace. Count Orloff and Baron de Brunow are spoken of as the Russian plenipotentiaries to the approaching Congress.

The Crimea.—The army news presents no new features, and is without interest. The weather had been extremely cold.

Asia Minor.—Advices from Trebizond to Twelfth mo. 29th, state that the cold was excessive, and that the ice and snow rendered communication with Erzeroum dangerous and difficult. The Turkish army in the latter city anxiously awaited the arrival of the troops from Trebizond. Omar Pacha was still at Redoubt Kale.

RUSSIA.—The government has ordered a further issue of paper money. The national debt of Russia amounts to 1,158,918,000 silver roubles. In 1844 it was 833,024,000 roubles. Advices, via Norway, mention that since the Allies raised the blockade of the White Sea, Tenth mo. 9th, between 300 and 400 vessels with full freights have entered the port of Archangel. The fortifications of that place had been much augmented, and there were being built six frigates and twenty screw steam gunboats. The weather had been open. The acceptance of the Austrian propositions had been published officially in St. Petersburg.

GREAT BRITAIN.—The favourable indications regarding peace, have caused a further advance in the funds, both English and Continental. Consols were quoted at 90½ a 90⅝. The cotton market was firm, and prices had advanced ⅛d. Breadstuffs were dull at former quotations. A number of marine disasters had occurred; among the vessels lost were the Sebago and Mary Green, of New York; the Independence, of Bath; and the Meteor, of Boston. The steamship Belgique came near foundering at sea, having sprung aleak 700 miles west of the Lizards, and it was only by the united exertions of the passengers and crew, that she was kept afloat until reaching Southampton, when she was found to have 6 feet of water in her hold. One of her boilers had also burned out. The Horizon, a new American ship, sailed from Liverpool on the 16th, for New Orleans, and on the 18th struck on the Arklow Bank, and became a total wreck. Parliament was to assemble on the 31st ult. It was the Queen's intention to open the session in person. Lord Palmerston had issued a circular to the members of the House of Commons, understood to be favourable to his government, stating that business of great importance would be brought before Parliament as soon as it assembled, and urging the members addressed to be present at the opening of the session.

SICILY.—A systematic attempt is being made to extend the cultivation of cotton in this island. It is said to grow well; the yearly produce is now about 4,200,000 pounds, with much unoccupied land suited for its culture.

PORTUGAL.—Torrents of rain continued to fall, causing much distress, especially along the banks of rivers. Several shocks of earthquakes had occurred, but no serious damage had been occasioned by them.

UNITED STATES. — *The Mint.* — During the year 1855, the entire amounts received at the U. S. Mint and branches, were in gold $58,862,922; in silver $5,711,-448. The total coinage for the year reached $56,312,-733.

The Banks.—The whole number of banks and branches throughout the United States, at the close of 1855, was 1273, having a nominal capital of $335,611,990; a circulation of $177,157,412, and specie on hand, $60,072,-830.

Nicaraguan Affairs.—Recent despatches from J. H. Wheeler, U. S. Minister to Nicaragua, represent Walker's military force to consist of 1200 men, and he says, Nicaragua will succeed in effecting an union of all the Central American States. He also defends his course in recognizing the new government. Parker H. French has again made formal application to be received as Minister from Nicaragua, but the Secretary of State declined to recognize him on the same grounds as cited in reply to his former application.

Congress.—William Cullom, of Tennessee, has been chosen Clerk of the House of Representatives, by a vote of 126 to 87. He was a member of the last Congress, and earnestly opposed the repeal of the Missouri Compromise. Adam J. Glossbrenner, Sergeant-at-arms to the last Congress, was re-elected, and the posts of Doorkeeper and Postmaster were filled by new appointments. The Senate confirmed the nomination of G. M. Dallas as Minister to England, without opposition. Several Senators have made speeches on the Central American question, all sustaining the American view of the Treaty with England on that subject.

The Ohio River.—The Board of Trade of Pittsburg have adopted resolutions suggesting that those connected with the commercial interests of both the Atlantic borders and the great Central Valley, meet in convention at Cincinnati, on the 1st of Fifth month next, to decide upon measures for the improvement of the Ohio river.

The Florida Indians.—Since the attack upon Lieut. Hartsuff's party, another small company of U. S. troops engaged in cutting wood, were surprised by the Indians, and five of their number were killed.

Pennsylvania Legislature.—In the House the joint resolution instructing our Senators, &c., to vote for the repeal of the Nebraska-Kansas act, after debate, was indefinitely postponed, yeas 34, nays 31. The Judiciary Committee reported adversely upon the bill changing the venue in the case of Passmore Williamson vs. Kane, from Delaware county to Philadelphia. Great numbers of petitions for the repeal of the Restraining Liquor Law of last session, have been presented, and also numerous remonstrances against the repeal. Among the latter was one signed by five thousand four hundred and twenty-six women of Philadelphia.

Pennsylvania Railroad.—The income of this road during the last year, amounted to $3,538,333. The cost of conducting the business including State tax on tonnage, was $1,709,056, leaving the profits of the year, $1,829,-277. The Pennsylvania Railroad Company has offered to purchase the main line of the State improvements for $7,500,000, payable monthly in distant instalments, the debt to bear interest at the rate of 5 per cent.

Kansas.—Late intelligence from Kansas states that no election was held in that territory at the period fixed, on account of apprehensions of another invasion from Missouri. Serious trouble was anticipated, and the people of the territory were preparing for a struggle.

New York.—Mortality last week, 377. The shipments of specie for the week, amounted to $421,111.

Philadelphia.—Mortality last week, 201; of smallpox, 22.

Miscellaneous.—Toleration in Russia.—In Russia, where the Greek Church is the State religion, Roman Catholics, Lutherans and Calvinists may hold the highest offices in the State. Nesselrode is a member of the Church of England.

Costly Pears.—A quantity of the Winter Virgalieu, or Columbian Virgalieu pears, have recently been sold in the New York market for $30 and $33 the barrel, or at the rate of 12½ cents each, for the best single specimens.

Novel Sleigh Ride.—The Chicago (Ill.) Journal of the 28th ult., says that Price, of the firm of Price & Fisher, of that city, arrived on that day from Green Bay, in a light sleigh drawn by a single dog. He averaged thirty miles a day on the journey.

Inroads of the Ocean.—The New Jersey Geological Report shows that the Atlantic is steadily and rather rapidly encroaching upon the land on its coast. In some places the advance has been a full mile since the Revolution.

The Texas Debt Bill, so long in suspense, has finally passed both branches of the Legislature, and received the Governor's approval, Texas thus accepting the act of Congress on the subject.

The Cholera in Porto Rico, continued to progress up to the 12th ult. The total number of cases reported was about 11,000, and 4500 deaths.

Vesuvius.—Letters from Naples state that some important change in the volcano was expected. A new crater had been opened, and the summit of the principal one had been flattened, and otherwise changed in form. Excursions to the mountain were considered extremely dangerous.

Mauna Loa.—A letter from Honolulu, of Twelfth mo. 4th, states that serious fears were entertained that the immense stream of lava flowing from the volcano, would occasion the destruction of Hilo. Its course was directly towards Byron's bay and the town, and only eight miles distant.

Rome.—The official census of 1855 shows a total population of 177,461, including 5081 priests, monks, nuns, &c.

Progress in Egypt.—Alexandria and Cairo now communicate with each other by railway and electric telegraph. By the former the distance is eight hours.

Successful Cultivation of Prunes.—Prunes have been very successfully cultivated in Pennsylvania. Among the Economists, in Beaver county, they have been grafted on plums.

Foreign Immigration.—During the year 1855, the New York Commissioners of Immigration "relieved, forwarded, and provided employment" for 172,336 destitute and diseased alien immigrants. It would from their report, that most of the immigrants la at New York, required assistance.

A Long Line of Railroad.—The Portland "Stat Maine" says that by the end of this year there will continous line of railway from the Atlantic Ocea Portland to Iowa City, a distance of 1436 miles.

British Railroads.—In the United Kingdom, ther 8240 miles of railroad, the cost of which, stock, &c cluded, amounted to £291,903,000, being at the ra £35,325 per mile. The total receipts of all the r during 1855, were £21,123,315. The net income is about 3½ per cent. upon the cost. The receipts in were £1,701,460, larger than in 1854.

The Cold.—In Lancaster county, Pa., the average perature of the First month, taken at 6 A. M. daily, 14.64°; the highest was 32° on the 13th; the lo 12° below zero on the 9th. The newspapers re many instances of persons having perished with cold, some of them occurring as far south as Louisi

RECEIPTS.

Received from Z. Hampton, agt., Io., for C. Gregg, vol. 29; from John A. Potter, N. Y., $2, vol. 29, an R. W. Wright, Thos. Bowerman, Wm. McKeel, A. Mel Chas. Wood, Jarvis Wooden, $2 each, vol. 29, for S Hoag, $1, to 26, vol. 29; from G. F. Read, for R. Chu ill, N. C., $2, vol. 29; from David Stanton, O., $ 26, vol. 29.

THE WESTERN SOUP SOCIETY.

We are requested to call the attention of the reade "The Friend" to the fact that the funds of this valu Institution are nearly exhausted, owing to the unusu severe weather, and increased demand for soup bread among the poor. The managers would be grat for further contributions to their funds, which ma sent to WILLIAM BIDDLE, Cor. of Eleventh and Arch s

The Great Volcanic Eruption.

Hilo, Hawaii, October 18, 1855.

d you ever hear of Hawaii? It is a grain of in the wide Pacific. It is the apex of a tain whose base is covered by those deep wa- not yet sounded by the mariner's plummet. a heap of basaltic rocks, thrown up in fusion immeasurable depths below. It is the top chimney leading down to the burning bowels e earth. It is one of the safety-valves of our t, through which escape the steam and gases h might shatter our mundane abode. It is a on the bosom of the ocean. It is an oasis in derness of waters—an emerald bower which ms and enchants the restless pilgrim. It is le landscape in which are combined the beau-, the lovely, the charming, the picturesque, romantic, the inimitable, the wild, the grand, lofty, the sublime, the awful, the terrific. ghing landscapes, merry rills, dashing cas-s, waving forests, smoking scoria, frowning pices, mural battlements, "cloud-capped ntains," and thundering volcanoes all cluster , and all are encircled by "the deep blue sea," fringed with snowy foam. Hawaii is a prize which mighty nations have struggled, and over h they now watch with jealous interest. And e—it is a field where Christianity and civiliza- have begun to shed their genial beams—a l plucked from the hand of Satan to adorn the em of Immanuel. But to the point. We pro- to give you a brief sketch of one of the most derful volcanic eruptions ever witnessed on planet. You are aware that we have a *per-ent* volcano—Kilauea—some thirty miles from . This is a vast pit about ten miles in cir-, and varying in depth from 600 to 1200 feet. hin this cauldron the fires are always burning, etimes sluggishly, then again with fearful ve-ence, while the ebon floor of the crater is raised dreds of feet by upheaving forces and succes- overflowings, and again depressed by lateral subterranean disgorgements. For several ths past this crater has been intensely active. may have read the published account of our d eruptions of 1840, '43, and '52, beside sc-l minor ones. All these were wonders of a tling kind. But an eruption is now in pro-s which eclipses all these. Its seat is near the mit of Mauna Loa (Long Mountain) 12,000 above sea-level. Kilauea is only 4000 feet , and is 35 miles from the present eruption. altitude of Mauna Loa is nearly 14,000 feet.

It is a vast volcanic dome, composed of slag, scoria, pumice, and other earthy matter, thrown up from the bowels of the earth in an igneous state, and heaped in wild and jagged masses to its present height. And still the process of disgorgement goes on, and still the Plutonic bull rises, and from his lanced heart a gory stream gushes forth. On the evening of the 11th of August, a point of light was seen on the mountain, which, in a short time, rose and spread and flooded those high altitudes with a glowing radiance. An immense valve had opened, out of which rushed floods of igneous fusion, and poured down the mountain sides in dazzling brightness. Down, *down* the fiery current rolled—diving into caves, rending their mineral roofs—exploding vast boulders—melting the rocks—startling the wild bull, the rough goat, and the mountain bird with its awful detonations—lighting up the heavens with a lurid glare, and sending off its gyrating and convolving clouds of black, dun, white, blue, purple, and scarlet, on the wings of every wind. Steam, smoke, and deadly gases filled the atmosphere, and the sight "was like devouring fire on the top of the mount." For sixty-eight days this fearful furnace has been in full blast, and still the fountain is not exhausted. The main stream, including all its windings, we estimate at sixty miles long, with an average breadth of three miles. Lateral streams shoot off at all angles from the main trunk, and sometimes the great stream separates into several channels, which again unite, thus forming many islands down the side and at the base of the mountain. The depth may vary from 3 to 300 feet. On the plains at the base of the mountain it spreads and forms lakes and seas of five, six, or eight miles in breadth. The superficial area now covered with the smouldering masses may be 115,200 acres. Its cubic measurement we will not attempt, nor will we weigh its ponderous masses. The great fire-pump still works with awful force at its high fountain, and the molten river rushes madly down toward Hilo. Its terminus is in a dense forest in the rear, and here, at the distance of some ten miles, it is gnawing down ancient trees, consuming all vegetable life, filling ravines, eating up the soil, drinking the streams, blasting the rocks, winding among the hills, or heaving them from their bases, leveling ridges, overcoming all obstructions, grading its own iron way, and moving in sullen progress upon us. Our atmosphere is loaded with dingy smoke and mineral gases, through which the sun's rays struggle with a yellow and sickly light, and all nature seems shrouded as in funeral drapery. Never was Hilo so hushed, so inquiring, so thoughtful. Many keep vigils the livelong night, and during the day plan modes of conveyance and places of deposit for the little earthly substance they have collected. And still the fiery ruin lingers in the woods, and still we hope and pray that the breath which kindled will extinguish it—that a high behest from the *Eternal Throne* will say, "*Hitherto—and no further.*" In an air-line the seat of eruption is about forty-five miles from Hilo, but so tortuous is the route, that one has to travel sixty-five or seventy miles to reach it. Between the port of Hilo and the mountain a dense forest some thirty miles wide interposes. This forest is so filled and entangled with tropical jungle as to be impenetrable by man except on condition of cutting and beating his way step by step, often at the rate of one or two miles a day. Wild streams of water from the mountains do, however, tear their way through the woods, bringing with them, in times of freshet, trees, shrubs, vines, leaves, rubbish, and earth, leaving a channel of hard, basaltic rocks. Such a channel is, in a dry time, the best track through the forest. On the 2d inst., a —— McCully (of Yale), with myself and four natives, started for the scene and the source of the present eruption. Taking the channel of a stream which enters Hilo Bay, as our path, we advanced with much toil through the dense jungle along its banks, and rested at night at the roots of an ancient tree—having made about twelve miles. The next day we made about twelve miles more, for the most part in the rocky bed of the stream, the water being low. Volcanic smoke filled the forest, and charred leaves came floating on the breeze and falling into the wild channel we were threading. At night, when the shades gathered over these deep solitudes, unbroken save by the bellowing of the mountain bull, the barking of the wild dog, the grunt of the forest boar, the wing and the note of the restless bird, the chirping of the insect, the falling of a time-worn tree, the gurgling of the rill, and the wild roar of the cataract, we made our little bed of ferns under the trunk of a prostrate tree, and here, for the first time, we found that the molten stream had passed us in the jungle on our left, and was now many miles below us on its way to Hilo. But we would not retreat, and as the jungle was nearly impenetrable in the direction of the stream, we pursued our upward way in the bed of the river till half past one P. M. on the third day, when we found ourselves out of the forest, and on the high plateau at the base of the mountain. I cannot stop to describe the beautiful, the romantic, the wild, the wonderful, in the banks, the narrows, the widenings, the rocks, the rapids, the cascades, the basins, the caves, and natural bridges of this solitary stream. Nor can I speak of the velvet mosses, the modest creepers, the rich festoons, the sweet wild flowers, the gigantic ferns, the ancient forests, and all the tropical glories which are mirrored in its limpid waters. We needed an artist and a naturalist to fix the glowing panorama, to paint the flora and catch the fauna of these romantic solitudes. When we emerged from the upper skirts of the woods, a dense fog obstructed our view of all distant objects, so that we could not see the summit-fires, nor trace the molten stream down the slope of the mountain. We encamped early in a vast cave; but during the night the stars came out, and the volcanic fires played brilliantly from their high source, down the mountain sides, over the scorified plains, and far down in the forest toward Hilo.

Early in the morning (Friday, the 5th) we left our cavern, and at half past seven A. M. were on that black and smouldering stream for which we had been searching for more than three days. Almost as far as the eye could reach these regions had been flooded with seas of fusion—now, for the

most part, hardened, but still smoking and crackling with heat and escaping gases.

We passed several miles up the left verge of the stream, and finding a narrow, well-solidified place, we crossed over to the right verge—our passage occupying an hour and a quarter. We now ascended rapidly along the right bank of the stream, sometimes upon it, and again skirting it, according to the facility of travelling or the directness of its course. The stream is very tortuous, making ample detours and sudden zigzags, so that we saved much by cutting off bends or following the bases of the triangles described in its course. All this day we came to no open fire. The first overflowings had stiffened and solidified in contact with the atmosphere, forming a broad ebon pall. Under this self-made counterpane the continuous stream had formed a vast duct; and in this subterranean pyroduct it now flows like oil, at the depth of from twenty to one hundred feet, unexposed to the stiffening action of the air. At night we slept on the higher regions of the mountain, beyond the line of vegetation, with the slag for our pillow, the heavens for our canopy, the stars for our watch-fires, and Israel's Shepherd for our guardian. We were astir early on Saturday morning, climbing over indescribable hills, cones, ridges, and masses of hot and smoking debris and scoria, scattered wild and wide over those Plutonic regions. We soon came to a line of jagged cones, with open orifices of from twenty to one hundred feet in diameter, standing over the molten river, and furnishing vents for its steam and gases.

We approached the vents with awe, and, looking down their fiery throats, we heard the infernal surgings, and saw the mad rushings of the great molten stream, fused to a white heat. The angle of descent is from 3° to 25°, and we judged the velocity to be forty miles an hour. The maddening stream seemed to be hurrying on, as if on swift commission from the Eternal to execute a work of wrath and desolation in the realms below. Upward and onward we went—climbing ridge after ridge, parched with thirst, panting in a rare atmosphere, blinded by smoke, almost scathed by heat and excoriated by sulphurous gases. All the rest of the way we saw frequent openings to the fiery canal, upon whose arched ceiling we walked for miles, with the fearful stream rushing madly beneath our feet. At 1 P. M. we found ourselves at the terminal crater, and standing on its craggy and smoking crest. This was the high fountain of eruption—the great chimney whose throat goes down immeasurable depths into those fearful realms where man's eye never penetrated, and where he cannot look and live. For nearly five days we had struggled to gain this point; and now we were here—specks, atoms in creation — obscured by smoke, startled by infernal hissings, confounded, stunned, amid these wild wonders, these awful displays of power which had scattered such a tempest of fiery hail, and raised such a raging sea of molten rocks on these everlasting hills. The grandeur, the sublimity, the terror of the scene were unutterable. A vast chasm had opened horizontally on the top of the mountain, and along this yawning fissure stood a series of elongated, jagged, and burning cones, about one hundred feet high, rent through their larger diameter, and throwing up dense columns of blue and white smoke, which covered the mountain's summit, rolled in fleecy masses down its sides, and spread out like the wings of chaos over unmeasured regions. Still no fire could be seen in this fountain-crater. We could feel it everywhere, and we could see and hear its escaping gases; but the throats of the cones were clogged with hot masses of cinders, pumice and ashes, with cracks, crevices, &c., for the escaping smoke. The fusion had long since found vent in a lateral, subterranean duct, several hundred feet below the rim of the crater, and in this covered way it flows off until it makes its appearance, as described, some two miles down the side of the mountain.

After a satisfactory survey of the terminal crater, and of the vast floods of ignition on the summit of the mountain, we descended a few miles down the eastern slope, and took our lodgings among the rocks, without wood, and with only a few spoonsful of water. Unwittingly we passed the last watering place early on Friday morning, and, having only a quart in our canteen, this was our whole allowance till 9 A. M. on Monday. We were reduced to a single spoonful each (six of us), and this only at our meals. In this high and rocky nest we spent the Sabbath, having a full view of the fires from the high furnace above to the terminus of the stream, as it ate its way, like a fiery serpent, through the forest and jungle far below. On Monday we decamped early, and laid our course for old Kilauea. At noon we were befogged, lost our way, and encamped at 1 P. M. On Tuesday we found our track and reached Kilauea. On Wednesday we explored, took measurements, collected specimens, &c., and on Thursday reached home, having been absent ten days.

Oct. 23.—It is now seventy-three days since the great mountain eruption commenced, and still its vigour is not abated. Had we found the incandescent stream flowing into the sea on our return from the mount, we had not been disappointed. Nothing but the great distance, the tortuous course of the stream, and the many obstructions in the route, could have prevented it from reaching the sea in one week. Down the side of the mountain proper, say twenty-five miles, it flows with terrible swiftness. At the base of the mount it flows over a plain of scoriform matter, cooled when agitated like the ocean in a tempest, and presenting a foaming surface of hills, valleys, cones, pits, ridges, gorges, caverns, &c., of some ten miles broad. Here the molten stream struggles, expanding, contracting, dividing, struggling to overcome obstructions, filling up vast basins, &c., and thus pushing sluggishly on to its third stage. This is that broad and dense forest already spoken of, extending from the plains at the base of the mountain, to within a few miles of the shores of Hilo. Here the fiery stream has found its greatest obstructions.

Through this forest the slope is very gradual—say 3°; while, in addition to hills, ridges, gorges, basins, etc., it meets hundreds of enormous trees, and dives into swamps of mud, pools of water, and wet jungles, which act as a prompt damper. Here, also, it finds a deep soil, which it must convert into ashes and igneous matter. Often, therefore, it does not progress an eighth of a mile a day in the woods, and thus our town has been more than once saved from devouring fire. In 1852 an igneous river approached with ten miles of us. That caused much solicitude, but this more, as the amount disgorged is greater, and the stream heads more directly for our town and harbour. One week brought the fearful stream from the mountain summit into the woods, or half way to the shore. In this forest it has been incessantly at work for sixty-six days, and yet the petrifying head of this Medusa does not emerge from the lower skirts of the jungle. We therefore begin to feel that the threatened ruin may be averted, and that the igneous current may spend its force in the forest, and thus open a future highway to the mountains

Should the stream continue to flow for days more, I propose to make a second ex tion—not as the first, to the high terminal tain, but to the terminus, or end of the strea it eats its sullen way in the jungle, revealed by its clouds of smoke by day and its baleft by night. This can be done only by cu through the entangled forest, step by step, we meet the fiery dragon in his own hidden way. Many a time have I thus approache incandescent stream and dipped up its gl fusion.

The foregoing is a glance at the facts conn with our present eruption, and our rapid to the mountain. Taking into account the dur of the flow, the length and breadth of the st and the amount of igneous matter disgorge say nothing of its present approach to our to it is the greatest eruption I have witnessed d my twenty years' residence at Hilo.

From Old Humphrey's Port

Old Humphrey at Hastings.

Bear with an old man's prattle, for his heart
Beats lovingly for thee and all mankind.

"Stands Hastings where it did?" said I, t to be cheerful, as I hobbled along with diffic supported by two porters from the railway t vehicle engaged to carry me to my place of nation; but no, it would not do. I was too n subdued and exhausted by my transit from mart of all the earth," to be cheerful. I had carried, on account of extreme weakness, from cab at the London Bridge station to the car that was to bear me onward; and some feared I should sink by the way, and never reach H ings. It pleased the Father of mercies th should be otherwise.

But, if not cheerful, I was at least grateful I was not unmindful that in all my prece visits to this delightful locality, the sea and breezes had gathered round me with healin their wings, and I was sanguine enough to and trust that I should again be benefited wi like result. I looked around with a thankful h to the great Giver of all good; and with ki feelings for my fellow passengers, as well as the porters bustling about me, and the driver his horse waiting for my accommodation. moved onward in an open carriage, the fi gentle breeze much revived me, and familiar jects presented themselves. Two of the t wind-mills, near the West Hill, were at work; old castle, in ruin, reminded me, that, like own, the best of its days were passed. The was rolling along its sparkling billows, as it wont to do thousands of years ago; bathing chines stood on the shore, their wheels part and partly out of the water. The Marine Pa was peopled with visitors; the great dial, hang over High street, pointed to a quarter-past fi the magnolia, for such I take it to be, cove the front of the house of Earl Waldegrave, adorned with magnificent flowers. All things peared as I had before seen them, only that old man, the knitter of night-caps, who fo many years had occupied a corner of the entra of the London road, was no longer an inhabi of the world.

For the first few days of my sojourn at H ings, I could not go from one room to anot even with help, without difficulty; but now, w a stick and a friendly arm, I can walk a hund yards, and perhaps two hundred. This is to a source of great enjoyment and thankfulness, it has suggested a thought to me, that would

me much satisfaction, if it could be rendered ical; and I see no good reason why it should

hat is the use of our *feeling*, grateful, unless mbody our emotions in useful or benevolent n? Deeds of love to man are the very soul anksgiving to God. When Simon Peter de- d that he loved the Saviour, the latter re- ed some proof of his assertion: "Feed my p;" and "Feed my lambs."

he number of visitors to Hastings is great, and not unreasonable thence to conclude that the er part of them must derive health or plea- from their temporary residence. For this are or ought to be grateful; why not, then, e manifest their gratitude by some act of kind- to a place that has so largely contributed to benefit? Some opulent visitors have the s of doing good on a large scale, while most s can do it only on a small one. It is not, ver, the amount, but the motive of the giver, ennobles the gift. Hastings has charities e funds are low; schools that require sup- ; poor fishermen, who, from shipwreck, want ccess, and other causes, suffer much; and and poor people standing in need of assist- . Now, if every grateful visitor, in a spirit nankfulness, would do ever so little in the of philanthropy, the aggregate would be very derable. Were a moiety only of those in the lists of visitors, that appear in the newspa- to act upon this suggestion, what a desirable sion it would prove to the cause of humanity, what a noble number of good Samaritans t thereby pour oil and wine into the wounds e afflicted!

is said, that on the overland passage across desert to India, there is a tree covered with nents of dress, and other articles, hung there ilgrims and travellers, to show their gratitude he protection and safety vouchsafed them; in Roman Catholic countries it is a common g for such as profess to have been cured by cles to leave behind them their crutches or r manifestations of past infirmity, by way of kfulness. Let us not, then, be outdone by omedans and fanatics; but as Christian peo- show our thankfulness in a christian man-

one of my walks in the Hackney Fields, lon, before my illness, I found a poor beetle y pathway, on his back, vainly struggling and ing to recover his feet. "Friend Sable-coat," I, playfully, "the proverb has it, that 'a friend eed is a friend indeed,' and I have arrived in time, it seems, to verify the adage; but as art really down, there will be no harm in my ting by thy fall:" so taking out my glass, I tively examined his curious formation; after h I gently laid across him a blade of grass, h enabled him once more to get on his legs, hide himself in a hole in the ground. Whe- he thanked me, or not, I cannot say, not ving the way in which such creatures express thanks; but I felt quite certain, whether I increased his happiness or not, I had added little to my own.

ow, in Hastings, there are human beetles on backs, or in other words, cases of distress h need assistance. Gentle reader, let me be- you to act upon my suggestion. I wish nei- to apportion the stream of your benevolence, to direct the express channel through which ould flow, but only to urge you to do some- , be it much or little, of a useful or charita- character; not ostentatiously, but modestly; if your name remain unknown, so much the er; should you be at a loss how to proceed, not knowing suitable objects for your sympathy, influential and well known benevolent persons would most, if not all of them, doubtless, willingly and faithfully assist in the dispo-al of your bounty.

While we offer to God thanksgiving for our abundant harvest, and pray that the sword may be scabbarded, and the pestilence stayed, let us be neither unmindful of our own particular blessings, nor ungrateful for them. In penning this paper, I have three objects in view. First, kindly to reprove a spirit of repining in which too many indulge; next to call out thankfulness in the heart, and lastly, to move the hand to gentle deeds of charity.

Having just forged a fable in my mental smithy, on the subject of discontent, I will with it close my present remarks.

A well shaped horse-shoe, as it hung against the wall in a blacksmith's shop, bitterly complained of the ill-usage to which it had been subjected. "No one," said the shoe in a whining tone, "has endured the fiery trials through which I have passed, without any respite being allowed me. The hard-hearted sledge hammer and anvil were my enemies, and between the two I was cruelly treated, and found no pity. I was beaten by them unmercifully, and the blows I received at their hands, would have killed an ox; as I said before no one has endured the fiery trials through which I have passed."

"Hold your foolish tongue," said a plow-share, which had been sent to be repaired, "unless you can talk more wisely. Both you and I have been greatly benefited by the ordeal through which we have passed, and are valued highly by those who once might have despised us. Once we were useless pieces of iron; but now you are a useful horse-shoe, and I am a respectable plow-share."

Thus seasonably admonished, the horse-shoe became silent, and was never afterwards heard to complain.

We seldom commit a greater error than that of repining at our trials and afflictions, for our heavenly Father often renders these the medium of his greatest mercies. "No chastening for the present seemeth to be joyous, but grievous; nevertheless afterward it yieldeth the peaceable fruit of righteousness unto them, which are exercised thereby." The complaining horse-shoe, though a fiction in the fable, is a fact when applied to mankind; for multitudes of repiners have become dumb, when experience has proved the value of their bitterest trials. Fear the Lord, love him, and trust him, and then—

> If properly improved, thy grief, and pains,
> And heaviest losses, all will turn to gains;
> Hope, peace and joy from trouble will arise,
> To bless thee, and prepare thee for the skies.

How to Keep Harness.—Observing the good condition and fine appearance of the harness of — Baker, proprietor of the most extensive livery establishment in Rochester, New York, we requested him to impart to us, for publication, the mode by which so desirable an object was achieved. In compliance therewith, he stated the course adopted as the best and most economical, after twenty years experience in a business which required considerable attention to tackling apparatus. His process of oiling and washing harness is substantially as follows:—Take neats foot oil and ivory or patent black—the latter well pulverized, or to be made so before using. Mix thoroughly, adding the black until the oil is well coloured or quite black. In cool weather the oil should be warmed somewhat before mixing. With a sponge apply a light coat of the mixture—only what the leather will readily absorb, unless the harness is very dry, in which case a heavier coating may be necessary. After the harness is dry—which will be in from two hours to a half or whole day, depending upon the weather and previous condition of the leather—wash thoroughly with soap suds. In making the suds use good castile soap and cold rain water. Warm water should never be used on harness leather. Apply the suds with a sponge. Rub off with buckskin. This will give your harness a nice glossy surface, and the leather will retain a good colour and continue pliable for months. If it becomes soiled with mud or sweat, an application of soap and water, as above directed, (without oiling) will be sufficient to give it a bright appearance. Two applications of this oil and black mixture a year (or once every six months,) will be sufficient to keep the harness as ordinarily used, in good order. It may be necessary for livery men, and others who use harness constantly, to apply the oil oftener—but, in most cases, two oilings a year, and washing with suds when soiled will keep a harness in good trim for sight and service. This process will pay a large dividend in extra service and durability, to say nothing of improved appearance. — Baker assures us that the same, or a very similar application, is just the thing for carriage tops which are made of top leather. The only difference in treatment is, that less oil should be used, or rather a lighter coating applied; and it should be washed off before drying in, top leather being thin and much more penetrable than harness. Of course, this mixture would not answer for enamelled leather, of which some carriage tops are constructed.—*Exchange Paper.*

Selected.

Diversity of Inspiration.

Whoever, says Dr. Cumming, was the evangelist, the Spirit was the teacher; whatever was the form or the size of the trumpet, it was the breath of God that sounded through it. All the peculiarities of Matthew, of Mark, of Luke, of John, of Peter, and of Paul, are retained, and may be traced and contrasted in reading their works, and yet they all spoke as they were moved by the Holy Ghost. Some have said, that if the Bible had been written as a beautiful essay, it would have been far more satisfactory to the minds of the educated, and no less instructive to the unenlightened. I think not. It would have been a dull book, and a dry book; it would have made a far feebler impression upon the hearts of the bulk of mankind. But by using men of every cast and turn of mind and thought, and pouring through these as channels, the truth of God—by not destroying John, but inspiring him; by not extinguishing Peter, but speaking through him—we have God's truth in all the various idiosyncrasies of men—in all the formulas of human speech; the same in nature, and distinguished by manifestations only; so that there is no peculiarity of taste, or temperament, or talent, or character that will not find something in the [Holy Scriptures,] suited to it, and calculated to instruct the soul of him that reads it. Let us bless God for the Bible, then as it is. Be assured, that the more you study it, the more you will love it; and they that know that book best will have the deepest and most indelible impression that God is its author, and truth is its matter, and eternal joy its issue.

A Pointed Reply.—One of the most pointed and remarkable replies on record, is that given by a Protestant gentleman, to some one who had repeated in his hearing the hackneyed sarcasm, that between the churches of England and Rome there was but a wall of paper. "True," said he, "*but the whole Bible is printed on it.*"

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

CALEB PUSEY.

(Continued from page 157.)

George Keith, in 1702 and 1703, was very troublesome in some places in America, amongst Friends, coming to their meeting-houses, and undertaking to speak and act with authority, as though he had Queen Anne's permission or direction to impose himself when and where he pleased. These actions and his writings against the Truth caused Caleb Pusey again to take up his pen, and in the year 1703 he came forth with "Proteus Ecclesiasticus, or George Keith varied in fundamentals, acknowledged by himself to be such, and proved an apostate, from his own definition; arguments, and reasons, contrary to his often repeated false pretensions, whereby he hath laboured to deceive the people, telling them he is not varied from any *fundamental principle*, nor *any principle* of the Christian faith, ever since he first came among the Quakers. With remarks on Daniel Leed's abusive almanac for the year 1703, by way of postscript. "Thou which teachest another, teachest thou not thyself." "A double-minded man is unstable in all his ways!"

We cannot undertake to give a synopsis of this book, which undertakes to set George Keith right in many points of fact, as well as to prove him wrong and very changeable in various important doctrines. We will give but one quotation. In page 24 of this book, after having set forth some of the doctrinal absurdities of George, who speaks of the righteous as having two burying-places, one outward and the other mystical, and that the mystic burying-place was "mysteriously figured by the burying place that Abraham purchased, where none but those who have 400 virtues, shall be buried;" he adds, "This is the man, that would be accounted the great corrector of errors in other men; but as for himself, he is, strange confidence, always sound in fundamentals. Monstrum, horrendum! This is the man on whom Doctor Bray, in his printed letter, prodigally squanders this epithet, viz., 'The excellent Mr. Keith.' Telling the world how the field is sown here in Pennsylvania, &c., by him. But O! what a miserable crop must needs be expected from such confused miscellaneous seed, since where the wind is sown, the whirlwind only is reaped. The increase or crop of this seed, may probably well deserve thrashing; but it is scarce worthy of grinding."

The palpable contradictions proven on George, in respect to doctrine, and his frequent pervertion of fact, as well as assertion of falsehood, stung him to the quick. He was afraid to let it pass unanswered, and he accordingly came forth with a pretended reply, entitled "The spirit of railing Shimei and of Baal's four hundred lying prophets entered into Caleb Pusey and his Quaker brethren in Pennsylvania, who approve him." This book contains much personal abuse, many reiterated perversions of fact, and a studied avoidance of the arguments in the "Proteus," which he could not answer.

Caleb Pusey was soon in print again, with "George Keith, once more, brought to the test, and proved a prevaricator." In this, Caleb not only uses convincing arguments to show that George was in error, but he introduces the testimony of credible witnesses to prove that he had been guilty of open falsehood, and perversion of truth. This book, as far as I have been able to discover, closed the public controversy between them. George soon returned to England, where he sank into obscurity, and experienced, there is good reason to believe, not only the reproofs of conscience, but the contempt of his fellow-citizens for the part he had acted towards his old friends, the Quakers. Caleb Pusey, in 1705, answered an attack of that fiercely fuile apostate from Quakerism, Francis Bugg, and, in 1706, once more came before the public, in reply to a fresh attack of Daniel Leeds. For several years he regularly repelled the false assertions made by Daniel, in his almanac. About the year 1705, "Talbot," a clergyman of the Church of England, gave notice of a meeting he intended to hold with the Quakers, to prove the charges made by Bugg, against them. The challenge was quickly answered in a half sheet, entitled "False News from Gath." Of this Caleb Pusey is understood to have been the author. After 1706, we find no traces of Caleb as a controversialist. He, however, was not idle: beside looking after his mill, attending to his civil duties, and many appointments in religious Society, he found time to record many facts relative to the early settlement of Pennsylvania, and his notes proved of essential service to Robert Proud, when he was preparing his History of Pennsylvania.

Caleb Pusey was often appointed by the Yearly Meeting, to prepare epistles, and indeed he was employed in most of the important services of Society. At what time he was appointed an elder, we do not know, but he attended the Yearly Meeting of Ministers in 1716, that being the first time that any elders sat in that body. He was a champion of civil and religious rights, an advocate for the abolition of slavery, and a firm friend of the Indians.

Of his character his memorial says, "He was a worthy elder in the church, being endowed with a good natural capacity, sound in judgment, and zealous in maintaining the cause of Truth against contrary and contending spirits. His constancy in attending meetings for worship and discipline, was remarkable and worthy of imitation. Much might be said of his zeal and integrity for truth, which he retained to the last; but, for brevity's sake, let it suffice, that he was a just man, therefore let him be had in remembrance."

A few years before his death, he gave up his mill, and removed to Marlborough, where his son-in-law, that honest old minister of the gospel, John Smith, resided. Here, honoured and beloved, he spent the remainder of his days, except when absent in the attendance of his religious meetings. His diligence in the fulfilment of his various duties continued unabated.

In the Twelfth month, 1726, he was taken ill, and for six days his distemper was heavy upon him. He, however, was preserved sensible to the last. During the progress of the disease, in the sensible evidence afforded him that the work of his day had, through the mercy of the Lord Jesus Christ, been accepted, and that nothing remained for him to do; he signified to his sorrowing family, that it was "a brave thing, to be prepared for death." The morning before he died, his son-in-law John Smith, inquired of him, how he was. His answer was, that "the time was near come that he must leave the world." John then said, "Father, I hope that is no surprise to thee." He answered, "No, no." After this he spoke little, that could be understood, only the expression of a living desire, well becoming a father in Truth, whose labours of love for the church were about closing, "That Friends might keep their meetings in uprightness."

His decease took place on the 25th day of the Twelfth month, 1726, he being in the seventy-sixth year of his age. The interment took place in Friends' burial-ground at London Grove.

(To be continued.)

Selecte

BARON VON CANITZ'S HYMN.

Come, my soul, thou must be waking—
Now is breakiag
O'er the earth another day.
Come to Him who made this splendour,
See thou render
All thy feeble powers can pay.

From the stars thy course be learning;
Dimly burning
'Neath the sun their light grows pale;
So let all that sense delighted
While benighted
From God's presence fade and fail.

Lo! how all of breath partaking,
Gladly waking,
Hail the sun's enlivening light!
Plants whose life mere sap doth nourish,
Rise and flourish,
When He breaks the shades of night.

Thou too hail the light returning—
Ready burning
Be the incense of thy powers;—
For the night is safely eaded;
God hath tended
With his care thy helpless hours.

Pray that he may prosper ever
Each endeavour
When thine aim is good and true;
But that He may ever thwart thee,
And convert thee,
When thou evil wouldst pursue.

Think that He thy ways beholdeth—
He unfoldeth
Every fault that lurks within;
Every stain of shame gloss'd over
Can discover,
And discern each deed of sin.

Fetter'd to the fleeting hours,
All our powers,
Vain and brief, are borne away;
Time, my soul, thy ship is steering,
Onward veering,
To the gulf of death a prey.

May'st thou then on life's last morrow,
Free from sorrow,
Pass away in slumber sweet;
And released from death's dark sadness,
Rise in gladness,
That far brighter Sun to greet.

Only God's free gifts abuse not,
His light refuse not,
But still his Spirit's voice obey;
Soon shall joy thy brow be wreathing,
Splendour breathing,
Fairer than the fairest day.

If aught of care this morn oppress thee,
To Him address thee,
Who, like the sun, is good to all;
He gilds the mountain tops, the while
His gracious smile
Will on the humblest valley fall.

Round the gifts his bounty show'rs,
Walls and tow'rs
Girt with flames thy God shall rear;
Angel legions to defend thee
Shall attend thee,
Hosts whom Satan's self shall fear.

Arnold's Christian Lif

American Wool.—The statement has been p
mulgated far and wide that American wool is u
to give that beautiful finish required for broadcl
of the best quality. It has been stated that
wools were longer in the staple than the fore
kinds, and were excellent for making strong wa
but did not possess the necessary felting property
quisite for fine cloth, and for this reason a li
foreign wool was necessary. H. C. Merriam
the last number of the Country Gentleman, s
ters all such assertions to the winds, and pro
conclusively that American wool surpasses all
eign wools for its felting properties, and for mak

ful broadcloth, light or heavy. He states merican grown wool and fine wool from Saxve been tested, and the palm awarded to the . The finest Saxony wool obtained from ary contained only 2,400 serrations to the hile wool obtained from samples of Ameri-ocks contained 2,552 serrations to the inch.

From "The Leisure Hour."

Showers of Frogs and Toads.

sudden appearance of myriads of young or toads, immediately after violent storms of n places where none were previously observs from the earliest times attracted attention, d to various speculations. Some have sup- and the belief is still largely entertained, ey descend in a shower from the sky; and cory has gained the more acceptance because s of trustworthiness have strenuously affirm- t they have themselves witnessed the phe non. Among ancient writers traces of this occur in Aristotle, Athenæus, and Ælian; among the moderns we may adduce the d Gesner, with many others of high reputa-

me naturalists have imagined the possibility generation or development of these little es in the sky; but others, while fully admit- he precipitous fall of hosts of young frogs, believe that they were developed aloft, but hey had been caught up by a whirlwind pass- ver some extensive morass, and afterwards itated to the ground. Cardan entertained ea that these frogs are the result of a sort of aneous generation; and Pison thought that id not fall in their true form as frogs from y, but that they were suddenly produced by rtilizing action of the rain upon the clods of arth. He evidently doubted the "frog- r," and sought for a satisfactory theory. n's and Pison's views need not, in the pre- ay, any attempt at refutation; but the theory hese little frogs are raised up by whirlwinds, terspouts ascending with a gyratory motion, nly requires examination. Here we shall o certain communications made to the "Aca- des Sciences," in Paris, in order to show the nd the deductions to be derived from them. the 13th of October, 1834, M. le colonel ier stated that in the month of the preceding st he saw, in the department of the Seine and a portion of the road covered with an in- rable quantity of little toads about as large French bean, although a quarter of an hour e he had not seen one in the same spot. In terval a heavy deluge of rain had fallen, and M. Marmier came to the conclusion that ad fallen from the same cloud which poured e water. But observe, M. Marmier did not is "toad fall;" he only *supposed* it to have place.

October 20th, at the *Séance*, or scientific ng a communication was received from M. r, in support of M. Marmier's opinion. It is tatement of an occurrence which he had ssed in his youth. A tempest was advancing he little town of Ham, in the department of omme, where he then resided. He watch- s threatening progress, when all at once the fell in torrents. He then saw the Place Ville covered with small toads. Astonished eir appearance, he stretched out his hand, received the shock of many of these ani-

The courtyard of the mansion was equally ning, and he saw them fall upon a slated roof ebound thence on the pavement. Afterwards eral migration of these creatures to the ad- t streams took place, a few bruised stragglers only remaining. "Whatever," adds M. Peltier, "may be the difficulty in explaining the transport of these reptiles, I do not the less insist on the fact, which from the surprise it caused me has left a profound impression on my memory." The celebrated M. Arago remarked that the author of this communication was too well known by his scientific labours for it to be supposed that he had carelessly observed the circumstances of the fact which he narrates.

At the same meeting, M. Duméril produced a communication of a similar nature from a lady of high attainments, and one of a family of great scientific eminence. "I was driving with my husband," she remarked, "in the park of the Château d'Orgnois, near Senlis, which we inhabited. It was then about midday, when the thunder growled deeply, and all on a sudden the day was obscured by an enormous black cloud. We immediately hastened along the road to the château, from which we were then at a considerable distance. A thunderbolt of extraordinary force burst the cloud which poured upon us a torrent of toads mixed with a little rain."

On the 28th of October, a communication to the scientific meeting was received from M. Huard, to the effect that as he proceeded to church at Jouy, in the mouth of June, accompanied by some friends, the party was overtaken by a storm, during the continuance of which he saw toads fall from the sky, and received them upon his umbrella. The ground for a considerable space was covered with a prodigious quantity of little toads, which hopped about in all directions. At the same meeting M. Gayet holding an official station under the minister of commerce, stated in a letter that, in the summer of 1794, being one of a body of 150 men cantoned in the village of Lalain, the party was overtaken, about three o'clock in the afternoon, by a sudden fall of rain, in such abundance, that the men, to escape being drenched, were obliged to resort for shelter to a large cave. But what was their surprise when they beheld falling on the ground about them a considerable number of toads, of the size of a hazel-nut. M. Gayet, disbelieving that these little reptiles fell with the rain, stretched out a pocket-handkerchief, assisted by one of the men, as high as they could hold it up; in a very short time it received a number of the toads, many of which were yet in a tadpole state.

M. Duparque, at the same meeting, made the following communication. On a Sunday in August, 1804, after many weeks of drought and heat, and after a stifling morning, a storm burst over the village of Frémard, near Amiens. He was then in company with the *curè* of the parish. In traversing the small close which separates the church from the parsonage-house they were both drenched; but, as he adds, "what surprised me most was to receive upon my person a number of little *frogs*. 'It rains *toads*,' said the venerable *curè*, remarking my astonishment; 'but this is not the first time that I have seen the like.' A great number of these reptiles were leaping on the ground; and on gaining the parsonage-house, we found the floor inundated with water and frogs, for the window facing the storm had been left open. The ground was paved with close brick-work, so that the animals could not have emerged from the earth; while (seeing that the bottom of the window frame was about two feet and a half from the ground) they could not have gained entrance from the outside by leaping. Moreover, the room was separated from the entrance-hall by a large dining-room, having two windows wide open, but *not opposed* to the direction of the rain, which therefore they did not enter; consequently neither water nor frogs were there found. I say *frogs*, for from the green colour of the back, the whiteness of the under surface, and the length of the hind quarters, it was easy to recognise them."

We might here multiply similar statements; but we will now turn to Roësel, a learned naturalist, whose personal observations on the subject in question are worth attention. After commenting on the asserted "frog and toad-showers," he says: "Now it happened to myself that, whilst taking a walk in the country, a sudden storm came on, and I hastened to a wood close by, to seek shelter under a beech. I felt something which fell upon my head, and at the same time I perceived that the earth all around me was covered with little frogs. I thought for the instant that these animals had fallen with the rain. In order to assure myself of the truth, I examined my hat and found that the slight shock I had experienced was produced by the end of a dry branch which remained upon it. The sun having re-appeared, I pursued my way, observing as I went a multitude of little frogs, which, in order to escape from the heat of the sun, soon disappeared altogether. I could not conceive how so great a number of animals could possibly appear and disappear so suddenly; but I satisfied myself by my research that all had placed themselves for shelter under stones and the tufts of herbage."

Here we think we have a clue to the mystery. Let the following particulars be taken into consideration:—First, the time of the year in which these presumed showers of frogs make their appearance corresponds with the season in which they put off their tadpole condition, and scatter themselves often in myriads over the fields, and the lanes and roads adjacent to the waters in which they were bred. Secondly, in June, July, and August, especially on the continent, there is often a continuance of drought and a burning sun. The earth is cracked and fissured in every direction; the herbage bends languidly; and under this, and in these fissures or chinks, or under clods and stones, the little reptiles crouch concealed, in order to escape the sun's rays. But let a sudden storm of rain come on, and instantly the ground seems alive with them. Refreshed and invigorated, they hop about in every direction, and either regain their native waters, or return to their lurking-places. Thirdly, a genial shower without a storm produces the same phenomenon as was observed by M. Duméril, once in the environs of Amiens, and at another time in the marsh-lands near Marbella, in Spain. In the latter instance, the reptiles were little *tree-frogs*, with which the dress of the observer was covered.

It is thus that we account for the phenomena. The reptiles are not showered down along with the rain-drops, but are called forth from their concealment by the rain.

What, then, are we to say with regard to the testimony of persons of integrity, who declare that they have witnessed these frog or toad showers? Can we discredit them? Let it be remembered that the storm or heavy shower is always described as sudden, local, and soon over; the air having been previously dry, the wind calm, the heat great; but no whirlwind is described which may be supposed capable of drawing up the animals and keeping them in aërial suspension. It is a sudden thunderstorm, produced by electrical changes in the upper currents of the atmosphere. Besides, how happens it that the frogs falling from so great an elevation are not all dashed to pieces by the shock? A frog thrown from the top of St. Paul's and alighting even on tolerably soft ground, would not hop about with much alacrity the next mo ment. What then would be the result of its fall

ing into a market-place paved with boulder stones, or upon the slates of a roof? How then, we repeat, are we to reconcile this with the testimony of intelligent and trustworthy persons, who assert that they have witnessed the phenomenon? We answer, that they have been misled by deceptive appearances; that the shocks they felt were probably caused by heavy rain drops; and that if they received these reptiles on their clothes, etc., it was not from the skies, but from the overhanging banks, bushes, or trees around them.

Correct observation is an art requiring practice and a certain tact which all do not possess. Hence the story of the barnicle-goose produced from a certain kind of sea-shell, as has been asserted by many very learned men, who have declared themselves eye-witnesses of the whole process. Thus is it that the want of this aptitude for judging correctly has led to many errors. Among undisciplined minds there is a vagueness in noting facts, appearances, or occurrences, the result being a rash and illogical deduction. "It is strange," says Dumèril, "to find in our day such a prejudice remaining amongst men of general good information, who go so far as to say that they have themselves seen these showers of frogs." We do not think so. Men of good general information are not always without their weak points, and having formed, however hastily, an opinion, are apt to cling to it with a tenacity which no efforts of reasoning can overcome.

For "The Friend."

While Catharine Evans and Sarah Cheevers were imprisoned in the Inquisition at Malta, they were frequently threatened with punishment for refusing to comply with the orders of the Friars. On one occasion a monk told Catharine she should be whipped, quartered and burnt that night, and her companion, too. She told him she did not fear; the Lord was on their side; and he had no power, but what he received, and if he did not use it to the end the Lord gave it to him, the Lord would judge him. At these words they were struck dumb, and went away. These sufferers for the Truth looked for little else than to be put to death, expecting for several weeks they should be led to the stake; but they were fully resigned, and given up to what the Lord might permit. Some who came to see them, would pity them for not turning Catholics; but others showed their hatred, by crying that they must be burnt; calling out, "Fuoco, fuoco," (fire, fire.) When for many days together, they were in expectation of being burned, Catharine had a dream, in which she saw a large room, and a great wood fire in the fire-place, and by it a person sitting in a chair, in the form of a servant, whom she took to be the Eternal Son of God. She also saw a lovely babe, sitting in a hollow chair over the fire, having on no clothes, but a little fine linen about the upper part of the body, and the fire flaming around it, while the infant was playing and appearing very happy. She would then have taken it up, for fear of its being burned, but he that sat in the chair, bid her let it alone. Turning around, she saw an angel, and then he that sat in the chair, bid her take the child, which she did, and found it had no harm. Awaking, she related the dream to Sarah, and desired her not to fear, since the heavenly host thus followed them.

In a letter to a friend, Catharine says, "The time is too little for me to disclose the twentieth part of the terrible trials; but whensoever we were brought upon any trial, the Lord did take away all fear from us, and multiplied our strength, and gave us power and boldness to plead for the truth of the Lord Jesus, and wisdom of words to stop the mouths of the gainsayers. Then they would say we had not the true faith, but we had all virtues. Dearly beloved, pray for us that we fall not, nor fail, whereby our enemies may have any advantage to rejoice and say, we served a god that could not save us, and called upon a god that could not deliver us; as if we were like them, to call upon stocks, stones, pictures and painted walls, and dead things that cannot hear, see, nor speak. Tell all our dear friends, fathers and elders, the pillars of the spiritual building, with the rest of our Christian brethren, that we do desire their prayers, for we have need of them."

The apostles of the Lord Jesus desired the brethren to pray for them; and so these devoted ministers of the same gospel, notwithstanding the evidence granted them of divine support in the hour of close trial, were at other times made sensible of their weakness, and their need of the fervent prayers of the righteous. If any are so strong and confident in their own attainments, as not to be sensible of the importance and necessity of the travail of their brethren and sisters for their support and preservation in the Truth, it is a pretty certain sign that they have become exalted above it, are losing, if they have not already lost true christian humility, and are in great danger of falling away. When people are sensible of their own frailty, and properly clothed with the fear of the Lord, they will have a low estimate of themselves and their experiences, and will be led to desire the help of their brethren and their prayers for their safe standing. They cannot lightly esteem the religious concern and services of their brethren, while they see themselves in the true light, and the dangers that surround them. The church of Christ is composed of living members, bound together in the fellowship of suffering and tender sympathy, as well as in love one to another, which qualifies them to weep with them that weep, and to rejoice with them that rejoice, when their Lord and Master reigns.

For "The Friend."

Separations.

I am quite of the mind that the sentiment expressed by Thomas Wilson, in the conference with G. Keith and his followers in Philadelphia, "is well worthy for friends every where to bear in mind, where he says, that if he, and his company were sound in faith and doctrine, and men of God, they should have kept up their testimony for the Lord *in the meeting;* and if there must have been a separation, such unsound men or persons, would have gone away from Friends, as those did formerly, of whom John said, 'They went out from us, because they were not of us,'" &c. This language was no doubt used by Thomas Wilson, in right authority on that occasion. But is it not equally worthy for Friends to remember, that what has been rightly spoken, at one time, and on one occasion, may not be the most suitable counsel, at another time, and under different circumstances.

When our early Friends were awakened to a sense of their own situation, as individuals, and saw the corruptions among the several religious denominations, with whom many of them had associated under profession of worship, they did not find their peace to consist in bearing or "keeping up their testimony for the Lord in the meetings to which they belonged" in the midst of the confusion, by which they were surrounded, but they felt drawn in spirit to "come out from among them," and to meet together with those who, like themselves, embraced the truth in the love and simplicity of it.

So likewise in this day of degeneracy, when there has been a going back towards that, out of which, our early Friends were drawn by an Almighty hand, and felt bound in spirit to come out of, may there not be circumstances under the peace, the safety, and even the very ex as a religious body, of those who are awake a sense of the corruptions in society—may in their meeting together, separate and apar those who have so gone back? and then ir ing up their testimony for the truth, where not be overborne and trodden down?

It is remarked by Robert Barclay, in hi logy, 10th Proposition, "It is the life of ch ity taking place in the heart, that makes a ch and so it is, a number of such, being alive, together in the life of christianity, that church of Christ: and it is all those that ar alive and quickened, considered together, tha the catholic church of Christ: therefore wh life ceaseth in one, then, that one ceaseth christian: and all power, virtue, and aut which he had as a christian, ceaseth with i

And as it is of one, so of many, yea, of a church: for seeing nothing makes a man t christian, but the life of christianity, inv ruling in the heart, so nothing makes a but the gathering of several true christian one body. Now, when all these members lo life, there the church ceaseth to be, though still uphold the form, and retain the name.

Maryland, Second mo. 10th, 1856.

For "The Fr

West-town Boarding-School.

It must be a pleasant circumstance to t rents and the friends of the children plu West-town School, that they have enjoyed uninterrupted health so far, through the p session, a favour which calls for gratitude Heavenly Protector. The caretakers are much labour and anxiety when health prevail the scholars have the advantage of a conti prosecution of their studies, by which they up one with another and the classes are unbi The ground being covered with snow has furn the pupils ample opportunity for healthful ex with their sleds, during the intervals betwee hours for study; which has probably contribu their vigour of body and mind. The mercury ha as low as from six to nineteen degrees below and frequently but few degrees above it, so the winter since the first of the year has mostly very cold.

A general repair throughout the school h ing, which has been in use nearly fifty years, has contributed greatly to the defen the inmates from the cold of the exterior a phere, particularly the putting in of new wi sash throughout the house. The exchan camphene for gas light relieves the officers the disagreeable business of trimming lamps obviates the danger from that inflammable while the gas affords a far superior light, duced into every apartment where it is ne Notwithstanding the coldness of the weathe supply of gas has been regular, except for a part of one evening, which shows the close tion paid to the wants of the school. Even commodation to promote the comfort and hea the pupils, which can reasonably be expect such an establishment, is provided and looke ter by the interested superintendent and mi We believe few such institutions will furnish real comfort, and carry out more effectually, West-town School, the object of a guarded e tion in the different branches of learning pro to be taught there. The vivacity and univ cheerfulness of the scholars of both sexes, an general observance of the rules, afford the that the benefits of a boarding school educatio in good measure attained.

ile engaged in the pursuit of learning, it is portant that sound religious principles should ulcated by reading the Holy Scriptures, and ritings of our experienced members, and ued by a consistent example on the part of retakers. Perhaps no external means ope- nore effectually to implant correct thought, ent and action, than the circumspect de- nt and conversation, and the kind, affection- entions of those, with whom children con- r mingle. They adopt very commonly the rs, and imbibe the sentiments of their ma- iends sooner or later, if these persist invia- in the path that leads to life, and thereby hat they regard christian purity and perfec- the highest and most desirable attainment. in this path alone that the immortal spirit preparing to fill up while here, the sphere fulness which the Great Creator designs it

neeting for divine worship, composed of 250 en of both sexes, sitting in a serious, becom- osture, is a beautiful sight, and must often e the minds of their governors and tutors ffectionate solicitude for their real welfare, e may safely believe that He who said, r the little children to come unto me and them not," is faithful to watch over them, n them of evil, to draw them with the cords e to himself, and as they give up to his in- ons to enamour them with the Truth, the f great price, and gradually enlarge their with the knowledge of the mysteries and ories of his gospel. To be in any degree nental in preparing children to become mem- the church of Christ here on earth, to be a the Lamb's army, and in their turn to be ved by him in gathering the next rising tion into the same church; is the highest r here, and will be crowned in the world to with joy unspeakable and full of glory. that be wise shall shine as the brightness firmament, and they that turn many to ousness, as the stars for ever and ever."

THE FRIEND.

SECOND MONTH 23, 1856.

have given place in the columns of the pre- umber to a communication from an unknown pondent upon "separations" in our religious ; in which the query is put, whether "there ot be circumstances under which "separation e necessary" for the peace, safety, and even ry existence as a religious body of those who wakened to a sense of the corruptions in so ? We cannot unite with some of the views ted in the essay, believing as we do that the ents expressed by Thomas Wilson on the t, and which are quoted approvingly in it, phatically true, and applicable not only to rcumstances under which they were origi- called forth, but also to those of the pre- me.

re certainly is no analogy between the set- p or first organization of the Society of ls, and the separations or divisions among embers within the Society as established.

early Friends had been educated in or in membership with some one or other of arious religious sects of their day, all of were, both in profession and practice, far be- e standard of doctrine and conduct held up New Testament: and when those early con- vere "awakened to a sense of their own situ- as individuals, and saw the corruptions of the several religious denominations," and also the purity and spirituality of the gospel dispensation, they rightly withdrew from religious communion with all others; and being brought by the Lord into fellowship one with another, under the authority of his Holy Spirit, they associated themselves together as a new society, not under the name or profession of any of those denominations from which they had separated, as Episcopalians, Presbyterians, Baptists, &c. but under the new name of Friends. For this new Society, whose faith was "primitive christianity revived," the Great Head of the church was pleased to institute a church government and discipline consistent with the pure principles and testimonies given to it to maintain; and from that time to the present, it has been as much the duty of the members to support the one as the other. In proof of this, we find that from the beginning, faithful Friends, who, as T. Wilson says, "kept up their testimony for the Lord in their meetings," have always laboured with those members who, under whatever plea put forth, have violated the discipline, or withdrawn themselves from the organization and authority set up in the Society; and where meetings have disregarded the order, or set at naught the discipline, it has always introduced their well-concerned members, and often others, into difficulty and suffering, as in the case of New England, prior to 1845, and others which have occurred in the Society; while on the other hand, hundreds of those who went off in the Hicksite schism, were disowned, not upon the charge of unsoundness in faith, but "for attending meetings set up contrary to the order and discipline of our religious Society."

A principle that admits of a portion of the members "meeting together separate and apart" whenever they may believe that another portion of their fellow members are "going back towards that out of which our early Friends were drawn," once sanctioned by the Society, would soon break up all our meetings and destroy its existence. The separatists in Ohio alleged in substance that they were obliged to take the course they did in order to maintain "their testimony for the truth where it will not be over-borne or trodden down."

The quotation from R. Barclay is taken from where he is demonstrating that the gift of gospel ministry is not transmitted by succession through an impure channel, or false church, and not to inculcate the idea that real Christians are not to be in church membership with any, who fall below the standard of true Christianity. His description of the church of Christ is most true; but as that church is made up of living members from among all denominations, so we have no account of any denomination or visible church composed of such members only. Of the twelve apostles one was a traitor, and in the primitive christian church, there were those whom the apostle pronounced carnal, "Whereas there is among you envying, and strife and divisions, are ye not carnal and walk as men:" these were addressed by him as members of the church at Corinth, but they could hardly be considered as members of the mystical body of Christ, and the apostle failed not to labour with them to bring them to a sense of their error, but did not advise their fellow members to separate from them. The spirit in which he laboured, and the estimation in which he was held, is shown, when in pleading with some who appear to have been exalted in imagination, respecting their own standing and attainment, he says, "Now ye are full; now ye are rich; ye have reigned as kings without us, and I would to God ye did reign, that we also might reign with you. We are fools for Christ's sake, but ye are wise in Christ; we are weak, but ye are strong; ye are honourable, but we are despised." "*Being defamed, we entreat:* we are made as the filth of the earth, and are as the offscouring of all things unto this day."

It is true, as Barclay says, that where *all* the "members lose this life, there the church ceaseth to be, though they still uphold the form and retain the name;" but we may be greatly deceived in supposing such a state of things to exist, for he also well observes, the true church "may not be observed even by some that are members of it, yet may there notwithstanding many belong to it;" as when Elias complained that he was left alone; God answered unto him, "I have, reserved to myself seven thousand men who have not bowed their knees to the image of Baal;" whence the apostle argues the being of a remnant in his day."

We believe that what we want in order to bring us back to a healthy condition is individual faithfulness, and a willingness to suffer patiently for the blessed cause, though, while doing so, we may be esteemed, as the apostle was, by those who are full and rich and reign as kings, to be fools, and despicable, and as the offscouring of all things; then, to use again the language of Thomas Wilson, being sound in faith and doctrine we would keep up our testimony for the Lord in our meetings, and if there must be a separation, unsound men or persons would go away from Friends as those did formerly of whom John said, "they went out from us because they were not of us."

SUMMARY OF EVENTS.

EUROPE.—The steamship Canada which left Liverpool on the 2d inst., arrived at Halifax on the 17th. She brought no intelligence of the missing steamer Pacific, which sailed from Liverpool on the 23d ult. The despatches of the Russian government completing and confirming the telegraphic announcement of the acceptance of Austria's propositions, were received at Vienna on the 23d ult., and a courier immediately conveyed them to Paris and London. A memorandum embodying the propositions, had been signed at Vienna, and sent to Paris and London. The signing of the preliminaries, prior to the opening of the Conference, only awaited the arrival of the Turkish Plenipotentiary. Baron Brunow and Count Orloff are the Russian Plenipotentiaries. Ld. Clarendon represents England; Count Buol, Austria; Waleroski, France; Dervish Pacha, Turkey; and the Marquis D'Azeglio, Sardinia. It was reported that the Conference would meet in Paris on the 17th inst. It is stated that Prussia refuses to agree to the conditions exacted by the Allies preliminary to her admission into the Peace Conferences, and that consequently she will be excluded from the Conference, but be invited to sign the final deed of settlement. The London Morning Advertiser has the following announcement:—"We regret to hear that at an interview which Lord Clarendon and Mr. Buchanan had together at the foreign office on Tuesday, very angry words passed between them, relative to the Central American question." Letters from the Baltic speak of mild weather, and the partial opening of navigation. The ice was breaking up. No events of moment had occurred in the Crimea. *Liverpool Market.*—the sales of cotton for the week had reached 85,000 bales at an advance of $\frac{1}{8}d$. Flour and grain had considerably declined. Prices were irregular, and the market dull. Western Canal flour was quoted at 37*s*.; Ohio, 40*s*. The London money market was more stringent. Consols, 90$\frac{1}{4}$ a 90$\frac{3}{8}$. The British Parliament was opened by the Queen in person, on the 31st ult. The Earl of Derby said that he considered the Royal speech as very bare, cold and meagre. He conceived that the government had violated a law of the United States, in the attempt to enlist men, and hoped an apology would be offered such as could be received. The Earl of Clarendon defended the government, but asserted the whole difficulty was capable of a peaceful solution, and no slight was meant by not mentioning America in the speech from the throne.

MEXICO.—At the latest dates, anarchy and confusion prevailed throughout the country, and the party opposed to the new government, was in a state of insurrection. Puebla had fallen into their hands, but the insurgent forces under Uraga had been defeated by the government troops.

UNITED STATES.—*Congress.*—The Annual Report

of the Superintendent of the Coast Survey, was laid before the Senate. Weller, of Cal., introduced a bill providing for an overland mail, from some point on the Mississippi river, to San Francisco. The Committee on the Judiciary has been instructed to consider the expediency of the appointment of a commission to revise the public statutes so as to reduce them to one connected text, and render their language plain to all. Sumner presented the resolution of the Massachusetts Legislature, complaining of the unconstitutionality of the Fugitive Slave Law, and calling on the President to take effectual measures to protect the sovereign people against outrages in Kansas. The subject of reducing the charges for ocean postage, has been referred to the Post Office Committee. In the House, the President's Annual Message and accompanying documents were referred to the Committee of the Whole on the State of the Union. A similar reference, after debate, was given to the Special Message on the state of affairs in Kansas.

Kansas Affairs.—On the 11th, the President issued a proclamation in which, after reciting some of the dangers impending over the territory, he calls on the citizens, both of the adjoining and distant States, to abstain from intermeddling in its local concerns, admonishing them that its organic laws are to be executed, and that illegal interference will incur condign punishment. In several of the Southern States, large companies of armed men, officered and disciplined, were preparing to go to Kansas, and a formidable invasion from Missouri was expected, as soon as the spring opened. The leaders of the Free State party in Kansas, have called urgently upon their friends in the Northern States for assistance. On the 14th, Governor Shannon arrived at Washington, and, after consultation with the Executive, left on the 16th on his return to the scene of difficulty. A despatch from Washington states that the U. S. troops at Fort Leavenworth and Fort Riley, 1200 in number, have been placed at his disposal, if a resort to extreme measures becomes needful. A. H. Reeder has presented a memorial to the House of Representatives, contesting the seat of J. S. Whitfield as delegate from Kansas. It states that the pretended election of Whitfield was absolutely void, and that he was elected by non-residents and other illegal votes.

New York.—Mortality last week, 377. The foreign imports entered since first mo. 1st, 1856, amounted on the 14th inst., to $25,983,965. The exports during the same period, to $8,716,205. There were, a few days since, about one hundred and fifty vessels over due, many of them passenger ships. On the 16th, the steamer Quaker City, of the New York and Savannah line, sailed for Liverpool with the mails, in place of the missing steamer Pacific. She took only seven passengers and little or no cargo.

Philadelphia.—Mortality last week, 254. There were 32 deaths from consumption, 16 from scarlet fever, and 20 from small-pox and varioloid.

California, dates to the 21st ult. The mines continued to yield their regular supply, which is estimated at about four and a half millions per month. Considerable rain had fallen within two weeks, much to the satisfaction of the farmers, who had been unable to plough for want of sufficient moisture. Preparations were making for sowing an unusual amount of wheat. The accounts from Oregon state that more fighting had taken place with the Indians at Walla-Walla; the U. S. troops engaged lost 23 men, killed and wounded; the Indians, it is supposed, a much larger number. An extensive coal range had been discovered on the coast of California.

The Isthmus.—Affairs in Nicaragua were quiet. The Walker government had recalled Parker H. French, and suspended diplomatic relations with J. H. Wheeler, the U. S. Minister, in consequence of the refusal to receive French by the U. S. government.

The Weather.—We place a few more items on record, showing the unusual severity of the winter. At Buffalo, N. Y., on the 13th inst., the thermometer stood at 13° below zero, a violent gale had been blowing for the previous 48 hours. The railroads were blocked with snow, and no trains had arrived for two days. At Oswego, N. Y., the fall of snow in the early part of the month, was so great that no stores were opened, or newspapers published for three days. The streets in many parts of the city, were impassable, the snow lying from four to ten and twenty feet in depth, and in some places the drifts were thirty feet deep. The average depth in the roads, was from six to eight feet. On the 14th, at Baltimore, the thermometer was 7° below zero. A late New York paper says, "The ice, which has so long blockaded the entrance to Long Island Sound, has cut off all our regular water communication with Boston, both by steamers and sailing vessels. In consequence, the business of our manufacturing commission merchants is seriously incommoded, as they are entirely unable to procure their supplies from the factories. Their stocks on hand have run down to a very low point, and some of them have now no goods at all to sell." On the 13th, the thermometer was 20° below zero, at Pittsburg. The last mail from Salt Lake reported the snow, fifteen feet deep on the plains. The westward bound mail was unable to proceed, and had returned to the frontiers. The most intense cold has been experienced in Minnesota. At Fort Snelling, the temperature for some days ranged from 27° to 33° below zero. One soldier had been frozen to death, and others had suffered severely. About four weeks ago, a pair of horses, with an open sleigh, came up to the door of a tavern on the prairie, in the southern part of Minnesota, from the direction of St. Paul, and the landlord, on going out, found the bodies of five men frozen stiff in the sleigh. At Pembina, in lat. 49°, the temperature had fallen to 52° below zero. Many horses and cattle had perished from the cold.

Miscellaneous.—Slavery Question in the U. S. Supreme Court.—The U. S. Supreme Court has, before it, a case from Missouri, involving—first, the right of citizens of slaveholding States to carry their slaves into non-slaveholding States for a temporary sojourn there, without the loss of their right of property in such slaves; and, third, the constitutionality of the Missouri compromise, as involved in the question of the right of Congress to legislate with reference to slavery in the United States territories.

Wild Rice in Minnesota.—The wild rice of the swamps in Minnesota, has produced an abundant crop this year, and upon this myriads of ducks and geese fatted until the water froze up. The Indians also made great use of wild rice. It has been sown in Connecticut, and produces well.

Slavery.—A bill declaring that any will, freeing slaves, shall be null and void, so far as the manumission is concerned, has passed the Senate of the State of Georgia.

Fejee Islands.—The U. S. sloop of war John Adams, in the Seventh month last, went to these Islands, to inquire into some alleged cruelties committed by the natives on American seamen, and to demand indemnity for the plunder of American vessels. The demand not being complied with, the John Adams burnt five of their towns. It is stated that the Islanders then submitted, and that Americans residing on the Islands, are considered safe.

Senator from Maryland.—On the 14th inst., Anthony Kennedy, "American," was elected U. S. Senator for six years, from Third mo. 4th, 1857.

Destruction of a Light House.—The light-house at Pengoteague, was swept away on the night of the 2d inst., together with three men, who were in it at the time.

Delaware River.—The river was measured last week from the slip at Vine street, to the wharf at Cooper's Creek, and found to be 2858 feet wide at that point.

Shipwrecks.—A letter from Capt. Freeman, of bark Yarmouth, Boston, dated Gibraltar, January 12th, says, that there were nineteen vessels, including two American ships, ashore in Gibraltar Bay, twenty-five between Cadiz and Cape Trafalgar, and one hundred between Cape de Gat and Cadiz. The number of lives lost was reported to be five hundred. Capt. Freeman's vessel went ashore in Gibraltar Bay, in the gale of the 8th ult., her keel was forced out, she was broken amidships, and would undoubtedly be condemned.

Vessels at the Principal Seaports.—There were, on the 9th instant, in port at New York, 713 vessels; at Boston, 143; at Philadelphia, 68; and at Baltimore, 92; and on the 1st instant, at Charleston, 65; at Savannah, 50; at Mobile, 85; and at New Orleans, 298 vessels.

Grain and Flour Receipts.—The receipts of Canadian grain at Oswego, N. Y., for 1855, were 9,459,172 bushels against 5,592,423 for the previous year. The receipts of Canadian flour in 1855, were 224,643 barrels, against 167,267 barrels in 1854.

The Progress of Chicago.—In 1840, its population was 4479; in 1845, 12,088; in 1850, 28,260; and in 1855; 82,028. Last year more than two and a half millions of dollars were expended in building.

A Costly Building.—The cost of the new State House in Columbus, Ohio, is said to have been $1,583,886.

Rumored Safety of the Pacific.—It is stated (doubtfully) on the strength of private despatches received by the Canada, that the Pacific is safe, having put back into the river Shannon, in Ireland.

RECEIPTS.

Received from Rachel Hoag, per G. C. C., N. Y., $2, vol. 29; from S. T. House, Pa., per C. J. A., $2, vol. 29; from R. K. Williams, Va., $2, to 18, vol. 30; from H. Knowles, agt., N. Y., for Jos. Collins, $2, vol. 29. Jesse Kirk and Elisha Kirk, O., $2 each, vol. 29.

THE WESTERN SOUP SOCIETY.

We are requested to call the attention of the rea "The Friend" to the fact that the funds of this s Institution are nearly exhausted, owing to the unu severe weather, and increased demand for sou bread among the poor. The managers would be g for further contributions to their funds, which r sent to William Biddle, Cor. of Eleventh and Arch s

M. C. Cope, No. 286 Filbert street,
M. L. Dawson, N. E. Cor. of Seventh & Wal
Samuel L. Baily, No. 252 Chesnut street.

WANTED.

A situation is desired by a young man, a Frien has some knowledge of business, and can write hand. He is willing to make himself generally to his employer, and has some knowledge of the b business, not so particular about the compensat to obtain suitable employment. City preferred.

Inquire at Friends' Bookstore, No. 84 Arch st.

FRIENDS' BOARDING-SCHOOL AT WEST-TO

The Winter Session of the School will close on t day, the 4th of Fourth month, and the Summer S will commence on Second-day, the 12th of Fifth next.

Those members of Philadelphia Yearly Meeting intend sending children to the school for the su session, will please make application for their adm on or before the 1st of Third month, to Joseph S don, Superintendent at the school, or to Joseph tergood, Treasurer, No. 84 Arch street, Philade The parents of those children now in the schoo also please notify the Superintendent whether th to return next session.

West-town, First mo. 28th, 1856.

Friends' Boarding-School for Indian Children, Tunessassah.

Two women Friends are wanted at this Institut assist in the family.

Also, a man Friend to aid in carrying out the cern for the improvement of the Indians.

Thomas Evans, } Philada.
Samuel Bettle, Jr. }

Died, at his residence in Smyrna, N. Y., in the year of his age, John W. Knowles; a member of Sc Particular and Monthly Meeting. Although resid a considerable distance from the place of meetin he was a diligent attender thereat, and was an ex of plainness and simplicity, being a consistent bel in the doctrines and testimonies of Friends. He the many trials meted out to him with much fort and resignation, and they tended to turn his mi the fountain of all good, and to deepen him in spi things. His disease caused him much suffering, v he bore with patience and resignation, saying th had endeavoured to examine closely how it stood him, and that he found very little in his way. In sion to the difficulties existing in the Society, h marked that Friends had great need to be en divested of self, in order to be qualified to judg specting them. He quietly passed away, and, th the mercy and redemption of Christ Jesus, ha doubt not, entered into rest.

Maury's Wind and Current Charts.

ury's "Wind and Current Charts," which already accomplished so much for the imnent of commerce and navigation, were proonly a very few years since. The plan was, ect the experience of numerous navigators, ting the winds, currents, storms and calms ey had encountered or observed in different f the ocean, and at different seasons of the Then, by marking down on a map the of their several vessels, with the winds, ts, &c., encountered by each, we would have t which would be a valuable guide for future tors, giving them the results of the comexperience of all whose tracks were thus l out. This chart might be so constructed how at a glance from what quarter the mawould *probably* find the wind to prevail in rt of the sea for any month, and the *degree* probability, also the set and velocity of the ts, the variation of the needle, &c.

rhaps it might be the first voyage of a young tor to the given port, when his own personal nce of the winds to be expected, and the ts to be encountered by the way, would it- blank. If so, there would be the wind rrent chart. It would spread out before ie tracks of a thousand vessels that had d him on the same voyage, wherever it be, and that, too, at the same season of the

"Thus the young mariner, instead of his way along until the lights of experiould come to him by the slow teachings of rest of all schools, would here find, at once, had already the experience of a thousand ors to guide him on his voyage. He might, re, set out upon his first voyage with as onfidence in his knowledge as to the winds rrents he might expect to meet with, as he himself had already been that way a d times before."

hile the young ship-master would be placed oting with the oldest sea-captains in this , the aged might see in these charts also vages made in their young days spread out them. There, on the chart, was the ship's her track, the year; and, by the colour and of the line,* the month might be told.

time of year in every part of the vessel's course, ted, by drawing the line representing her track ent colours for the different seasons—black for green for spring, red for summer, and blue for and by using a continuous line (——) for the first month of each season, a broken line (— — —) for the second, and a dotted line (- - - - - -) for the third. Thus the Twelfth month, being the first winter month, is represented by a continuous black line; the Fourth month (the second spring month) by a broken green line; the Eighth month (the last month of summer) by a dotted red line; the Ninth month by a continuous blue line, and so on.

There, on that day, in that latitude and longitude, these charts would remind the old sailor that he had encountered a terrible gale of wind; there, that he had been beset with calms; how here, with fair winds and a smooth sea, he had made a glorious run: here, he had first encountered the trades; and there lost them. At this place, he had met with a 'hawsing current;' here, the winds were squally with rain; and there, it was he had been beset with fogs; here, with thunder storms

"Such a chart could not fail to commend itself to intelligent ship-masters, and such a chart was constructed for them. They took it to sea; they tried it, and to their surprise and delight they found that, with the knowledge it afforded, the remote corners of the earth were brought closer together, in some instances by many days' sail. The passage hence to the equator alone, was shortened ten days." The average time from the United States to California, was reduced from 183 to 135 days; and the average passage from England to Australia, from 124 to 97 days.

It has been estimated that this system of research and the charts resulting from it, will occasion an annual saving in the commerce of this country with California, South America, China, and the East Indies, on the outward passages alone, of two and a quarter millions of dollars; that when the system is extended to the Indian Ocean, it will produce an annual saving to British commerce of one or two million dollars in those waters alone, and in all seas, of ten millions.

As illustrating the favourable opinion of *practical* navigators, respecting the labours of Lieut. Maury, we extract the following from a communication published in the N. York Commercial Advertiser, of the 30th of last month. The writer signs himself "An Old Salt," and says he has seen "many a gallant ship riding smoothly at anchor in her destined harbour, whose commander has acknowledged in terms of unqualified praise, the assistance he has received from the elegant and correct charts, the handiwork of Lieutenant Maury, of the National Observatory at Washington. Wherever our flag floats there Maury's charts are to be found in the racks of our merchant marine, and he who knows the backwardness of our *merchant* captains to receive as truth anything emanating from the United States or any other navy, knows well that no higher tribute can be paid to that gentleman.

"Let any one, having even a remote idea of the trackless ocean, look upon one of these charts and see there the courses of hundreds of ships marked out, their speed, directions of the winds at all seasons of the year, and how distinguishable all these tracks are from one another by their different colours and characters, and he will understand how the least educated of our merchant captains may comprehend them and apply them to his daily course. Has a ship made a certain voyage, which a mariner proposes to sail upon, in a remarkably quick time in a certain month? these charts have that voyage clearly marked out and the mariner has nought to do but pursue that track. My quickest voyage around the world was in last year, by the help of such a chart, and on arriving home it grieved me to find that the country was about to be deprived of the services of a man,* than whom, in my opinion, none has accomplished the fiftieth part as much in the same period.

"In conclusion I may safely say that my voyage was shortened thirty days by his diligent research, and that hundreds of merchant captains may be found who will join with me in expressing the hope that he may be replaced to continue those useful labours that, even though in their comparative infancy, yet have furnished such eminently advantageous sailing directions."

When the intention of constructing the "Wind and Current Charts" was announced, and mariners were invited to furnish the requisite information, "there was a flight up into the garrets, and a ransacking of time-honoured sea-chests in all the maritime communities of the country for old logbooks and sea-journals;" and it was from data gleaned from such records that the first charts were compiled. All the tracks that could thus be collected at the time, were projected, "and one was surprised to see how they cut up and divided the ocean off into great turnpike-looking thoroughfares." There was the road to China and to Australia, around the Cape of Good Hope; it and the road to South America, and that to the Pacific around Cape Horn, "were one and the same until the navigator had crossed the equator into the South Atlantic. Here, there was, in this great highway, a fork to the right," leading to Rio Janeiro and other ports of Brazil. "A little farther on you came to another on the left: it was the road by which the Cape of Good Hope was to be doubled." It struck off into the broad Atlantic almost directly east, while the right hand road continued on southward, nearly in its former course until it doubled Cape Horn. "There was no finger-board or other visible sign to guide the way-farer, but, nevertheless, all turned off at the same place."†

"This outward road to India and the gold fields of Australia, was a crooked one, but the road home from the Cape was straight; for the winds along it were fresh and fair. But the outward-bound route from the United States especially, was most curious. It seemed, on the chart, to be as well beaten, and almost as well defined, as any Indian trail through the wilderness. First, it struck

* According to the Advertiser, their correspondent is under a wrong impression: the services of the projector of the "Wind and Current Charts" are to be retained by the government, and "he is reappointed exclusively to that very duty for which he has shown himself so eminently qualified, and in the prosecution of which he has achieved such just fame for himself and his country."

† The author, of course, speaks here comparatively. These "turnpike-looking thoroughfares" were in places one or two hundred miles in width, though in other parts of the ocean much narrower—and the turning points varied in proportion.

across the Atlantic until it reached the Cape de Verd Islands on the other side; then it took a turn, and came back on this side again," nearly to the coast of Brazil. "Here, there was another turn, and another recrossing of the broad ocean, striking this time for the Cape of Good Hope."

Thus the great highway from the United States to the Indian Ocean and the East, nearly crossed the Atlantic three times, while the homeward route crossed it but once, the latter passing indeed within a few hundred miles of St. Roque, but avoiding entirely the great western sweep to the coast of Southern Brazil, and the eastern detour to the Cape de Verd Islands. "All the vessels that sailed went by one road, and returned by the other. Now and then, there was a sort of a country cross-road, that was frequented by robbers and bad men as they passed on their voyage from *Africa* to the *West Indies* and back. But all the rest of the ocean on the wayside, and to the distance of hundreds of miles on either hand, was blank, and seemed as untravelled, and as much out of the way of the haunts of civilized man, as are the solitudes of the wilderness that lie broad off from the emigrants' trail to Oregon. Such was the old route.

"Who were the engineers that laid out these highways upon the sea, and why did traders never try short cuts across the blank spaces? There was neither rock, nor shoal, nor hidden danger of any sort to prevent; why did not traders, therefore, seek to cut off these elbows in the great thoroughfares, and, instead of crossing the Atlantic three times on their way to the Cape of Good Hope, cross it only once, as they did, coming home?"

In answer to this question, it was found that the early navigators, from Europe to the east, upon reaching the vicinity of the Cape de Verd Islands, and approaching the equator, were driven over by the winds towards the coast of Brazil. Thus, was the route to the Cape of Good Hope first laid out; and "as one traveller in the wilderness follows in the trail of another, so did the trader on the high seas follow in the wake of those who led the way." And so, when the first voyages were undertaken from the United States to the East Indies, it was thought most prudent to join the regular route from Europe to the Cape as early as practicable, and they aimed to fall in with it about the Cape de Verd Islands. There was also a tradition of dangerous currents north of St. Roque, sweeping to the westward, along the north coast of Brazil; and each navigator preferred to sail along the route written down in the books, and to follow in the wake of his predecessors, rather than risk untried paths. The investigations projected by Lieut. Maury, have proved that the currents just alluded to are scarcely worth the name, at least that little or no danger is to be apprehended from them; and accordingly mariners now speak of them as the "bugbear of St. Roque."

When the first "Wind and Current Charts" were published, the attention of navigators was called to the blank spaces; and the importance of more extensive and more accurate observations than the old sea-journals contained, was urged upon them. They were told that any ship-master, who would send to the National Observatory at Washington, regularly, at the end of every cruise, an abstract log of his voyage, containing accurate observations of the winds, currents, &c., encountered, would receive in return a copy of the Charts and Sailing Directions.

"The quick, practical mind of the American ship-master took hold of the proposition at once." "So in a little while, there were more than a thousand navigators engaged day and night, and in all parts of the ocean, in making and recording observations according to a uniform plan, and in furthering this attempt to increase our knowledge as to the winds and currents of the sea, and other phenomena that relate to its safe navigation and physical geography." "Important results soon followed, and great discoveries were made. These attracted the attention of the commercial world, and did not escape the notice of philosophers everywhere." "All who use the sea, were equally interested in the undertaking. The government of the United States, so considering the matter, proposed a uniform system of observations at sea, and invited all the maritime states of Christendom to a conference upon the subject.

"This conference, consisting of representatives from France, England, and Russia, from Sweden and Norway, Holland, Denmark, Belgium, Portugal, and the United States, met in Brussels, August 23, 1853, and recommended a plan of observations, which should be followed on board the vessels of all friendly nations, and especially of those there present in the persons of their representatives. Prussia, Spain, the free city of Hamburg, the republics of Bremen and Chili, and the empires of Austria and Brazil, have since offered their co-operation also in the same plan.

"Thus the sea has been brought regularly within the domains of philosophical research, and crowded with observers. In peace and in war, these observations are to be carried on; and, in case any of the vessels, on board of which they are conducted, may be captured, the abstract log—as the journal which contains these observations is called—is to be held sacred."

"Rarely before has there been such a sublime spectacle presented to the scientific world: all nations agreeing to unite and co-operate in carrying out one system of philosophical research with regard to the sea. Though they may be enemies in all else, here they are to be friends. Every ship that navigates the high seas with these charts and blank abstract logs on board, may henceforth be regarded as a floating observatory, a temple of science. The instruments used by every co-operating vessel, are to be compared with standards that are common to all; so that an observation that is made anywhere and in any ship, may be referred to and compared with all similar observations, by all other ships, in all other parts of the world.

"But these meteorological observations which this extensive and admirable system includes, will relate only to the sea. It is a pity. The plan should include the land also, and be universal. It is now proposed to have another and general meteorological Congress; and the initiatory steps, by way of counsel, for calling it together, have been taken, both in England and on the continent. It is to be hoped that this country will not fail to co-operate in such a humane, wise, and noble undertaking. It involves a study of the laws which regulate the atmosphere, and a careful investigation of all its phenomena."

This system of research as applied to the ocean, has already developed many interesting facts and principles, and has given rise to what may almost be considered a new branch of science, which Humboldt has called THE PHYSICAL GEOGRAPHY OF THE SEA. Under this term is included, according to Lieut. Maury, "a philosophical account of the winds and currents of the sea; of the circulation of the atmosphere and ocean; of the temperature and depth of the sea; of the wonders that are hidden in its depths; and of the phenomena that display themselves at its surface." It is from Maury's work on this new and fruitful subject, published about a year since, that the present article is chiefly compiled, and we propose occasionally to make further selections fr interesting volume. The author says that has been "to present the gleanings from th field in a manner that may be interesting structive to all—whether old or young, as afloat—who desire a closer look into 'the w of the great deep,' or a better knowledge its winds, its adaptations, or its physica graphy." His style is for the most part agr and at times quite pleasing; but it is diffuse, more especially in the frequent rep of the same ideas. We may, therefore, in t posed selections, occasionally omit a word or or make some slight verbal change, not in by the quotation marks; for which liberti general acknowledgment may suffice. L

From Old Humphrey's Pe

A Leaf from the Book of affliction.

The closer we connect our earthly objec our heavenly hopes, the greater will l peace; and the clearer we discern the hand heavenly Father in our daily concerns, th shall we reverence him, love him, and live glory.

But not only as the general fountain of al ness should we regard God as the bestower o gifts which more directly come from him, as intellect, or knowledge of ourselves as sinn pentance, faith, peace, and joy; but also lesser benefits we receive from our fellow cre for the hearts of all are in his holy hands, moves them according to his will. A habit tributing the kind offices of those around marily to God's goodness, will not lesse thankfulness to those through whom we r them.

"God moves in a mysterious way
His wonders to perform,"

And employs different agents. By an an comforts Hagar; by a raven supplies the w Elijah; sends a man of God to benefit the of Zarephath, and a captive Hebrew maide Naaman, the Syrian, may be healed.

I want, if I can, in an humble, earnes grateful spirit, to impress the mind of my r by a recent instance in my own experience, advantage of connecting earthly and he things; and of acknowledging God's goodn the kind attentions and friendly offices of dear to us.

It sometimes happened that during my w ings in the vast, the silent, and solitary str the Highlands of Scotland, some years ago, reduced to great straits by wearines, hunge thirst, the recollection of which is still vi my memory. While noting down these re scenes of an impressive character come back me, where the eagle and ptarmigan haun towering crags, black cattle spread over the wild deer roam the forest, and black cock moorfowl abound on the heaths and hills. and then a kilted Highlander tending his fishing, or crossing a river in a boat, impa added interest to the surrounding objects. Ben Maedhui, Ben Gloe and Ben Nevis, als before me, with big Benmor, gigantic Sheh bulky Ben Cruachan, and storm riven Ben Loch Tunmel, Loch Rannoch and lonely Lydock, appear to be visible with the dark ing pass of Killicrankie, and that glen of shut up by its craggy barriers, gloomy Gl in which the clan Macdonald were murdere

Well, though I had much to enjoy, I ha as before intimated, at times something to re for high mountains are not ascended, and ex straths and swamps traversed without t

ours together I was wet to the skin, and deep in the watery bogs. On two or three se occasions, when spent with toil, sick at with hunger, and feverish with burning I found at the little inns I came to, such expected and an abundant supply of com- in the shape of dry clothes and good cheer, led forth my surprise and thankfulness. g the things, however, which afforded me lar relief and pleasure, were the cool and ble jams and jellies that were set before me hirable profusion. Whether this arose from hausted and feverish state, or whether these ves and sweetmeats were really superior to ng of the kind I had ever before tasted, I say; but the enjoyment they afforded me reat, and left a lasting impression on my y.

an early stage of my present illness, which had reason to believe would be unto death, ght as I lay in bed in pain, greatly subdued, rely afflicted with unassuagable thirst, the embrance of these Scotch preserves came ne so forcibly, as to produce a morbid and ssible wish, once more, to taste them. Hav- ne kind Caledonian friends, whose faces I yet saw, residing in an old Hall, and doubt- t that they were provided with the dainties dently longed for, I caused a letter to be sed to them making known my desire. No was this done, than I regretted the step by me, thinking it might be regarded as a e request, and too familiar a liberty; it was, er, too late to correct my supposed error.

ut the time that I expected the letter to its destination at "Powder Hall," a loud rap at my own door announced the arrival of a bearing a white wicker hamper, which, on opened, was found to contain a liberal sup- jams and jellies of varied kinds, and of the t quality. I feasted my eyes with the d pots of preserves ranged side by side. they were, strawberry, raspberry, red cur- gooseberry, marmalade, and a pretty little jujube. For my kind friends to send them was a favour of which I was very sensible; dispatch them with such promptitude, and, marvellous alacrity, was an attention that affected me. A near relation of the old hall, residing with them, as though she must e way or other have a share in the sending friendly hamper, forwarded me a neat and l flower stand, worked in leather, or gutta ; and, soon after the hamper's arrival, in- was made, at the request of the worthy head family himself, whether the preserves ar- without injury, evidently with the view of ng an accident, had any occurred, to pre- isappointment on my part.

think not, reader, that the kindness of my was limited to the sweetmeats; they sent o a book, suitable to my state of affliction, r with sweet letters, from time to time, of wn; and hymns, the reading of which often d me at even-tide. The letters were not of commonplace communications, too fre- y written to sick people, wherein serious- d solemnity are put on for the occasion, xts of holy Scriptures are ostentatiously d to the eye, rather than lovingly com- d to the heart; but chastened, mature, and nced epistles of christian piety, setting aithfully solemn scriptural truths, as well nises of divine consolation, showing, with ire to minister to the comfort of the perish- dy, a yet greater anxiety for the welfare of dying soul.

e, then, was the link uniting earthly with heavenly things, and pressing on my considera- tion the goodness of God, even in the lesser events of life. I was just in the frame of mind to enable me to get good from book and letters. Again, I say, that the closer we connect our earthly objects with our heavenly hopes, the greater will be our peace; and the clearer we discern the hand of our heavenly Father in our daily concerns, the more shall we reverence him, love him, and live to his glory.

O, the unspeakable consolation of the presence of God in seasons of affliction! Well, may we pray that "the peace of God which passeth all understanding," may "keep" our "hearts and minds in the knowledge and love of God, and of his Son, Jesus Christ our Lord." In such seasons, with an humble, broken, contrite, and grateful spirit, we call to mind our mercies, and our language is, "Bless the Lord, O my soul, and all that is within me, bless his holy name. Bless the Lord, O my soul, and forget not all his benefits: who forgiveth all thine iniquities; who healeth all thy diseases; who redeemeth thy life from destruction; who crowneth thee with loving- kindness, and tender mercies." Psa. ciii. 1-4.

The kindness of our friends may be regarded as a brook by the way, to comfort us in our pilgrim course; whose stream becomes the more refresh- ing when we believe that the fountain whence it flows, is the love of our heavenly Father, who gave his Son to die for sinners; and it is no trifling alleviation to know, in the midst of our afflictions, that they proceed from the same Almighty source of goodness and mercy, and are sent for our advan- tage. Whether, then, we enjoy or suffer, "the grace of our Lord Jesus Christ, the love of God, and the fellowship of the Holy Ghost," should be the subject of our daily thoughts; thus uniting our passing interests with our everlasting expec- tations.

Help me, O Lord, in all my infirmities; forgive all my transgressions; and abundantly increase my love and knowledge of him, whom to know is eternal life.

My grovelling spirit, in thy mercy raise;
Let holy objects to my heart be given,
That faith may mingled be with prayer and praise,
And all my earthly ends with hopes of heaven.
Lord, let me see thy hand thro' life and death,
Where'er abroad my wandering feet may rove;
And humbly serve thee till my latest breath,
And love thee with an everlasting love.

For "The Friend."

"A Night Scene in London."

[Under this heading the editor of "Household Words" describes what he one night witnessed outside of the White-chapel workhouse:]

On the 5th of Eleventh mo., last I, the conduc- tor of the journal, accompanied by a friend well known to the public accidentally strayed into Whitechapel. It was a miserable evening, very dark, very muddy, and raining hard.—There are many woful sights in that part of London, and it has been well known to me in most of its aspects for many years. We had forgotten the mud and rain in slowly walking along and looking about us, when we found ourselves, at eight o'clock, before the workhouse. Crouched against the wall of the work-house, in the dark street, on the muddy pavement-stones, with the rain running upon them, were five bundles of rags They were motionless, and had no resemblance to the human form. Five great beehives covered with rags— five dead bodies taken out of graves, tied neck and heels, and covered with rags—would have looked like those five bundles upon which the rain rained down in the public street.

"What is this?" said my companion; "what is this?"

"Some miserable people shut out of the casual ward, I think," said I.

[The writer then describes his inquiries in the workhouse. He found that the women were shut out simply because the house was full.]

We went to the ragged bundle nearest the work- house door, and I touched it. The rags began to be stirred slowly within, and by little and little a head was unshrouded—the head of a young woman of three or four and twenty, as I should judge, gaunt with want, and foul with dirt, but not natu- rally ugly.

"Tell us," said I, stooping down, "why are you lying here?"

"Because I can't get into the workhouse."

She spoke in a faint, dull way, and had no curi- osity or interest left. She looked dreamily at the black sky and the falling rain, but never looked at me or my companion.

"Were you here last night?"

"Yes; all last night, and the night afore too."

"Do you know any of these others?"

"I know her next but one; she was here last night, and she told she come out of Essex. I don't know no more of her,"

"You were here all last night, but you have not been here all day?"

"No; not all day."

"Where have you been all day?"

"About the streets."

"What have you had to eat?"

"Nothing."

"Come," said I, "think a little. You are tired and have been asleep, and do not quite consider what you are saying to us. You have had some- thing to eat to day. Come! think of it."

"No, I haven't Nothing but such bits as I could pick up about the market. Why, look at me!"

She bared her neck, and I covered it up again.

"If you had a shilling to get some supper and a lodging, should you know where to get it?"

"Yes, I could do that."

"For God's sake get it, then."

I put the money into her hand, and she feebly rose and went away. She never thanked me, never looked at me, melted away into the miser- able night, in the strangest manner I ever saw. I have seen many strange things, but not one that has left a deeper impression on my memory than the dull impassive way in which that worn out heap of misery took that piece of money and was lost. One by one I spoke to all the five. In every one interest and curiosity were as extinct as in the first. They were all dull and languid. No one made any profession or complaint, no one cared to look at me, no one thanked me. When I came to the third, I suppose she saw that my companion and I glanced, with a new horrow upon us, at the last two, who had dropped against each other in their sleep, and were lying like broken images. She said she believed they were young sisters.— These were the only words that were originated among the five.

Increasing the Size of Flowers.—A horticultur- ist of the suburbs of Versailles, in studying the physiology of the vegetable kingdom, conceived the idea that the smallness of certain plants—the vi- let, for example—was owing to an atmospheric pressure too great for their delicate organs. Hav- ing fixed this idea in his mind, the florist conceived the notion of putting his idea into practice. Pro- viding himself with a small balloon, rendered suffi- ciently tight to prevent the escape of any gas, he launched it into the air, having attached to it a

silken cord twelve hundred metres long. Instead of a car, the balloon sustained a flower-pot of Parma violets. This experiment has been going on about two months with the most wonderful results, in the shape of violets as large as Bengal roses. It is expected that the above experiment may be turned to some account.

For "The Friend."

Early Anti-Slavery Advocates.

BENJAMIN LAY.

(Continued from page 180.)

The residence of Benjamin and Sarah Lay in the Island of Barbadoes, could not have exceeded one or two years. They then sold out their stock of goods, and returned to London, where they were residing in 1722, in which year Sarah paid a religious visit to Friends in Ireland. We have little account of what Benjamin did for some years. But we gather that his testimony against slavery was growing deeper, and more energetic. He remembered the scenes of suffering he had witnessed, and pecuniary gain and the influence of a slaveholding society, no longer tended to blind the moral eye, or blunt the tender susceptibility of nature.

In the year 1727, George the Second was crowned king of England, and Benjamin believed it would be right to do in his case, as he had done for his predecessor. In waiting on the king with a copy of Milton's pamphlet, he was admitted to an interview with the queen also. At what time he left London we do not know, but he had become reconciled to his Friends there, and was a member in unity. In 1730, he was with his family living in Colchester, his native town. For some cause or other, he was again involved in difficulty with the Society of Friends, and it appears this time to have been with the Two Weeks' meeting at Colchester. In 1731, he determined to remove to Pennsylvania. Although "under dealing," and not having made "satisfaction" to Friends for the cause of offence he had given, he attended Colchester Monthly Meeting towards the close of that year, and requested a certificate of membership for himself and wife to Friends in America. It appears that he was not a member of that meeting, yet on the 4th of the Twelfth month, a certificate was granted him, addressed "to Friends and Brethren in Pennsylvania, Philadelphia, or wheresoever these may come." The certificate states his offence to Devonshire House meeting, and mentions that he had given that meeting satisfaction, and adds "that he had of late behaved himself as becometh the Truth." His wife is noticed as a minister and serviceable Friend. This certificate was evidently granted without due consideration.

With this certificate they took passage for Philadelphia, in the ship Elizabeth & Dorothy, commanded by Captain John Reeves, which brought news from London, to the 9th of Second month, 1732, and reached her destination on the 8th or 9th of the Fourth month. Sarah attended the Seventh-day Morning Meeting on the 10th, and her services appear to have been acceptable to Friends. On the 30th, Benjamin attended Philadelphia Monthly Meeting, and produced their certificate, which was read and returned to him, he stating they had not determined where to fix their abode. On the 28th of Fifth month, he produced the certificate again to the Monthly Meeting with information, that he intended to settle in the city of Philadelphia, whereupon the reception of the certificate was noted on the minutes. Soon after Benjamin Lay had sailed for America, it was spread abroad in England, that he had taken a certificate of membership with him. Anxious that Friends in America should not be imposed on, the Friends at the Quarterly Meeting at Colchester, held on the 12th of the Fourth mo., 1732, made a minute, setting forth the irregularity of the proceeding in the case, and shortly after the Two Weeks Meeting at Colchester, prepared an epistle on the same subject, both of which were forwarded to the Monthly Meeting of Philadelphia. These documents show conclusively that he was not in unity with Friends, and that they did not consider him entitled to a certificate of membership. It is possible that Benjamin Lay had a portion of that spirit which does not like to make concessions. Earnest, enthusiastic, and liable from constitutional excitement to go wrong, he probably found it no easy matter to confess himself in error. He may have thought, that professing the principles of Friends, living an exemplary life, and being permitted, for want of the strict enforcement of the discipline, to attend the sittings of Colchester Monthly Meeting, they might send him away as a member to any meeting, within the verge of which he should settle. When the Monthly Meeting of Philadelphia received the communications from Colchester, showing the irregularity of the certificate granted, it appears to have been perplexed to decide what to do. No notice was taken at first on minute, and a private correspondence with Friends of England on the subject, took place. They esteemed Sarah Lay, and they did not wish to shut up her way amongst them. So the matter rested for some time, Benjamin taking no steps to be reconciled to his Friends in England, and continuing to reside in Philadelphia. Whatever may have been the kind of store kept by Benjamin Lay in Colchester, he was a bookseller in Philadelphia, and advertised in the Eighth and Ninth months of 1732, a large collection of books. Among those enumerated, we find large and small Bibles, Testaments, psalters, primers, horn-books, book of Martyrs, Josephus and Eusebeus' Church Histories, the doctrinal works of Penn, Barclay, Fox, Burrough, Howgill, Whitehead, and he adds most ancient Friends' writings, Sewell's History, History of England, Juri-divino, Seneca, and Epictetus, books of Arithmetic, Mathematics, Astronomy, Trigonometry, Whiston's Euclid, &c. "Also, a parcel of wool or worsted combs and wool cards, with other English goods, near Andrew Bradford's, in Second street, Philadelphia."

In the meantime, Benjamin Lay's testimony against slavery, and his vehement zeal in the matter, was violently on the increase. In the ship in which he came from England, were sailors, who had been in the Guinea trade, and they, when drunk, gave such horrible details of the abuse inflicted on the negroes, as fastened to the trade a more awful and bestial character, than Benjamin had ever imagined belonged to it. When he reached Pennsylvania, and found many Friends engaged in slaveholding,—the importing had previously been forbidden by discipline—his excitement against them knew no bounds. He found the writings of some against slavery, circulating amongst Friends, and doubtless those of William Southeby and John Farmer were among them, along with those of William Burling, of Long Island, and Ralph Sandiford, of Upper Dublin, Philadelphia County. Ralph Sandiford had published his "Brief Examination of the Practice of the Times," a sharp reproof of slavery, in 1729, and was in a poor state of health, his mind being diseased, and his bodily strength declining. Benjamin Lay was delighted with the writings of Sandiford, and visited him on his death bed several times.

Benjamin Lay, at this time, was so much absorbed by the subject of slavery, that he introduced it on all occasions, and of course he soon met with position. He grew tired of the city, when found the members of the Society whose pr ples he venerated, were, by holding slaves, nected with a system, which he considered i tably associated with robbery and outrage. purchased a few acres of ground, about six n north of Philadelphia, within the limits of Ab ton Monthly Meeting. He probably occupied of 1732 and 1733, in preparing this for his h planting an orchard, and having a cottage b which is said to have resembled a cave. H ther planted walnut trees near by the house erected the house near some already growing. removal probably took place in the year 1 On the 9th of the First month, 1734, he cam Philadelphia Monthly Meeting, and having formed the Friends assembled, that he and family had removed to settle at Abington, quested a certificate of membership to that Mo ly Meeting Anthony Morris and John Br hurst were appointed to make the usual inqui concerning him. It was now necessary to ac the information received from England. At next Monthly Meeting, the Friends appointe his request, reported that there was an obst tion to granting a certificate, and mentione the meeting the communications received f Colchester Quarterly and Two Weeks Meeti The papers were read, and after consideration meeting informed Benjamin that he could hav certificate from them until the obstruction removed. In other words until he had bee reconciled to his Friends in England, where had been a member, and obtain a regular c ficate from thence. This they recommended to do, but the advice was not acceptable, and rejected it.

In the year 1734, Colchester Two Weeks' M ing sent a certificate for Sarah Lay, which accepted in Philadephia. Her husband was much irritated at this separating man and wife he called it. Near the close of 1735, Sarah was released by death from her many afflicti amongst which no doubt the undue zeal of husband, and his contentious opposition to m valuable Friends must be enumerated. The Select Meeting she attended was the 6th of Tenth month, that year. We will here sub a brief memorial of her, issued by Abing Monthly Meeting.

"About the latter end of 1735, died Sarah late wife of Benjamin Lay, of Abington. was born in Rochester, in the county of Kent Old England, about the year 1677, and was vinced of the principles of Truth in her you years. She had a gift in the ministry besto on her, in which she was serviceable; and tr led in that service, with the concurrence of Friends, in her native land, and in Scotland Ireland; as also to some adjacent parts of continent. Her service therein was accepte Aged about 58 years; a minister, about 23. was buried at Abington."

(To be continued.)

The Raining Tree.—The island of Fierro is of the most considerable of the Canaries, ar conceive the name to be given it upon this acco that its soil, not affording as much as one dro fresh water, seems to be iron. There is in island neither river nor rivulet, nor well, spring, save that only towards the seaside t are some wells, but they lie at such a dist from the city that the inhabitants can make no thereof. But the great Preserver and Susta of all, remedies this inconvenience in a way s

tinary that man will be forced to acknowledge
ie gives in this an undeniable demonstration
wonderful goodness. For in the midst there
ree which is the only one of the kind, inas-
as it has no resemblance to any of those
n to us in Europe. The leaves are long and
w, and continue in constant verdure, winter
ummer, and the branches are covered with
d which is never dispelled, but resolving into
isture, causes to fall from its leaves a very
water, and in such abundance that the cis-
which are placed at the foot of the tree to
re it, are never empty, but contain enough to
y both man and beast.

UNCLE ISHAM.

e Episcopal Recorder says:—The following very
iful lines were handed to us, as written by a lady
rth Carolina, on the death of an aged negro ser-
They are well worthy of study, both from their
sic merit, and from the manner in which they
op some of the least observed, but most important
es of the relations on which they touch.

ess is left to love us here—the good old man is
gone;
till he points us to the Rock he loved to rest upon;
ess to warn us what to do, and what to leave un-
done;
till he animates our souls the Christian's race to
run.

ugh years he loved to labour, as a happy child
loves play—
ved the garden, loved the corn, and loved the new
mown hay;
ade a pet of everything by Nature's bounty given;
oked on Nature as herself the work and gift of
heaven.

ugh years we saw him daily fed by his old household
band—
ead stooped low to meet the cup in loving child-
hood's hand,
by this utter helplessness we saw him sorely tried,
owed in sweet humility before the Crucified.

aw him robed in holiness—we saw him filled with
love
all who dwell beneath the skies—for him who
reigns above;
how his soul was feasting on the bread of life
Divine!
drinking of the blessed cup that flows with hea-
venly wine.

aw him silent, fearing still to speak the holy name;
when the Spirit bade him spread abroad the Sa-
viour's fame,
aw his withered arms upraised, we heard his ear-
nest prayer,
every soul upon the earth his Saviour's grace
might share.

eard his gospel messages—we heard his glorious
Psalm
rans! praises evermore to God and to the Lamb!
in his silent ecstasies we saw the tear-drop stand,
ose dim eyes he could not reach with his poor
palsied hand.

God hath wiped those tears away, that hand hath
power to hold
waving palm of victory, the thrilling harp of gold;
brow that looked all meekness here, now wears a
radiant crown
t evermore before the throne of glory boweth down!

miss him when we seem to tread the narrow path
alone—
miss his fitly spoken words, we miss their touching
tone
every chord within his breast was so attuned by
miss the music of his voice as we would miss a
dove.

miss him when a blessing comes, we wish with him
to share,
when a fiery trial comes, we miss his fervent
prayer;
But Saviour! when we draw towards Thee, his words
salute our ear:—
"We cannot get too near the Lord—we cannot get too
near!"

So like some sweet confiding child, he loved on Thee
to rest,
With thy own robe of righteousness so folded round his
breast,
That even Death's dread arrow, fell as hurtless by thy
side,
We think of him as one who lives, and not as one who
died.

And when before the mercy-seat we sometimes dare to
kneel,
So poor in spirit, that the sense of want is all we feel,
Thy quickening Spirit bids us ask: Dear Saviour, let
us be
Still more like him—for then, we shall be more and
more like Thee!

Martyred Blind Boy.

In the reign of "Bloody Mary," of England, when the good Bishop Hooper was about to be burned to death, a blind boy, by much importunity, prevailed on the guard to bring him to the bishop. This boy had lately suffered imprisonment in Gloucester, for confessing the truth. After the bishop had examined him concerning his faith and the cause of his imprisonment, he looked on him steadfastly, tears standing in his eyes, and said, "Ah, poor boy, God hath taken from thee thy outward sight, for what reason he best knoweth: but he hath endued thy soul with the eye of knowledge and faith. God give thee grace continually to pray unto him, that thou lose not that sight; for thou shouldest then be blind both in body and soul."

The boy's name was Thomas Dowry. How often or how long he had endured imprisonment for the truth's sake, is not known; but on his final examination he was brought before Dr. Williams, Chancellor of Gloucester, sitting judicially with the register of the diocese in the consistory, near the south door of the cathedral church, who administered the usual articles, chiefly urging that on transubstantiation, and saying—

"Dost thou not believe that after the words of consecration spoken by the priest, there remaineth the very real body of Christ in the sacrament of the altar?"

"No," answered the blind boy, "that I do not."

"Then," said the chancellor, "thou art an heretic, and shalt be burned. But who taught you this heresy?"

"You, Master Chancellor."

"Where, I pray thee?"

"Even in yonder place," replied the boy, turning and pointing with his hand towards where the pulpit stood. The chancellor again inquired—

"When did I teach thee so?"

Dowry answered, "When you preached there (naming a day) a sermon to all men as well as to me, upon the sacrament. You said the sacrament was to be received spiritually, by faith, and not carnally and really, as the papists have heretofore taught."

The shameless apostate answered—

"Then do as I have done, and thou shalt live, as I do, and escape burning."

The blind boy said—

"Though you can so easily dispense with yourself, and mock God, the world, and your conscience, yet will I not do so."

"Then God have mercy upon thee" rejoined the chancellor; "for I will read the condemnation sentence against thee."

"God's will be fulfilled!" answered the young martyr.

Hereupon the register, being moved with the scene, stood up, and said to the chancellor—

"Fie, for shame, man! will you read the sentence against him and condemn yourself? Away, away, and substitute some other to give sentence and judgment."

"No, register," said the fearfully hardened man, "I will obey the law, and give sentence myself according to mine office."

He did so; delivered him to the secular power, who on the very same day led the blind boy to the place of execution at Gloucester, together with one Thomas Croker, a poor bricklayer, condemned also for the like testimony of the truth; when both, in one fire, most constantly and joyfully yielded their souls into the hand of the Lord Jesus.—*English Martyrology.*

Selected.

First month, 1820. Daniel Wheeler says, "We often wonder how you are going on in England, whether you are sharing in any degree our cold winter. I sometimes think yours must have been more severe than for several years past, as the wind has been between north and east for the greater part of the last three months. I cannot possibly describe what we have had to encounter here; the Russians say, there has not been so severe a winter since the year 1800. It came upon us all at once; in the beginning of the Tenth month, we could not get the plough into the ground, and we were shortly driven off altogether. The quantity of snow is great, and where it has drifted, it is very deep indeed, and the frost has been intense. This night we have twenty degrees, and it has been as low as thirty-one degrees by Reaumer's scale, 37° below zero, Fahr. I was in the city of Petersburgh, on the coldest day, and did not suffer, though when I shut my eyes, perhaps, for half a minute, it was difficult to open them again. At one time our prospect was very gloomy, as the children seemed as if they could not bear it. We have abundance of wolves, which are drawn by the severity of the weather, nearer than usual to the abodes of men. The intense cold sometimes drives them mad; six cases have occurred within our knowledge of people being bitten by wolves in this state—four of which proved fatal, and in the other two, the parties recovered, having had the parts cut out, and the wound seared with a hot iron. One man had his face torn by a wolf, close by our house, but he succeeded in killing it; we all saw it, and a terrible animal it is to encounter. This man, though he submitted to the operation, subsequently fell a victim to hydrophobia. When the frost is very great, the smaller birds fall to the ground; I have several times seen this. Though the wolf prowls round our habitation by night, we are favoured to be quiet and peaceful within, and to partake of many consolations."

"After some cold rainy weather, winter commences, which freezes over parts of the Lake Ladoga; these are soon broken up by the wind, when the ice comes down in large flakes, and blocks up the gulf of Finland and the Neva. Shortly after this, the winter comes in reality, and fixes the ice, often, in a very rough state, just as it has been hurried down by the current—many of the flakes lying one upon another. Often the whole becomes solid in forty-eight hours; after which roads are levelled over the rough ice at those places, where the pontoon bridges and ferries have been, which are marked out by fir-trees set up in the ice. These crossings frequently remain passable until the Fourth month; for although the snow melts off the land three weeks earlier, yet the river remains frozen, owing to the frosty nights; the roads are sometimes dusty before the ice breaks up in the river."

For "The Friend."

The Importance of being able to withstand Ridicule.

It is a most desirable attainment to be able on all occasions to offer a successful resistance to the shafts of ridicule. It would be well therefore to endeavour to learn in early life by what means we can arm ourselves with sufficient courage and firmness to secure our integrity and our principles, as well from the witling's sneer, as from the barefaced attacks of open ridicule; for we can no more properly exercise our reason under the constant fear of ridicule, than we can enjoy life under the harassing dread of impending death.

If we consider it right to differ in judgment or in practice from our associates, or from the world at large, in any important point of morals or religion, let us do so seriously, deliberately and steadfastly, as though we were conscious of carrying souls of our own within our bosoms, without being dishcartened by the bantering of the witling, and without being turned aside from any honest purpose, by all the ridicule that can be brought to play upon us.

What does it matter, if we are laughed at as whimsical, when we have the assurance within ourselves, that we are under the guidance of principle? or why should we be dismayed when we are ridiculed as hypocritical, when we have God for our witness, that we are honestly endeavouring to do that which is right? We may be accounted awkward and uncouth in our manners, when measured by the world's standard of fashion or refinement; but if an honest, sincere soul continues to wrestle within us, we will in the end attain to, and be judged by a higher law than satire ever compassed.

Let us then rest assured, that a steady, consistent adherence to true principles, a just moderation in our language and demeanour, and a christian firmness in the performance of those things which right reason and our consciences approve, are the most likely means we can devise for converting thoughtless witticism into sincere respect; and for enabling us to grow in wisdom and virtue, and in favour both with God and man.

Chinese Physicians.

In China, the physicians are at the same time apothecaries, and sell to their patients the remedies they prescribe; but although these two professions are intimately connected with one another, and in themselves by no means incompatible, there are some objections to their being exercised by the same individual. Some abuses may easily enter into the exercise of functions that support each other so completely—as, for instance, human frailty considered, the physicians may yield to the temptation of prescribing costly remedies, or even sometimes of prolonging the malady for the purpose of procuring more considerable profits for his friend, the apothecary. The prodigious quantity of drugs that enter into the composition of Chinese medicines has indeed always appeared to us rather surprising; and yet we would not venture to say that the circumstance is not to be accounted for from the fact we have mentioned, of their being prescribed and sold by the same person.

The fear of being fleeced by the doctor has given rise to a curious custom, quite in accordance with Chinese manners. The physician and the patient usually enter into an earnest discussion concerning the value and price of the medicines ordered. The other members of the family, too, take part in this odd sort of bargaining; they ask the doctor to prescribe common, cheap drugs, and they examine the prescription, and strike out such as are too expensive. Possibly, the effect of the medicine may be thereby rendered slow or doubtful, but they will put up with that, and run the risk. They always hope, too, that the alteration will not be of much consequence, and that it will be pretty much the same in the end. In fact, the great recommendation of Chinese practice is, that one prescription is about as good as another, and that whether you absorb a little more or less of their black beverages will probably make very little difference. The physician, after having haggled for a long time, generally ends by abating something of the price of his merchandize, for the simple reason that if he did not, the patient would go to another shop.

Very surprising and very *Chinese* scenes, however, sometimes occur with reference to these cases. When the physician-apothecary has said his last word, and declared positively that to obtain the cure it is indispensably necessary to make use of this or that remedy, a family council is held, actually in the presence of the sick person, in which the question of life or death is coolly put, and frequently arguments brought forward to show that, considering the advanced age of the patient, or the hopeless nature of the malady, it may be better not to incur a useless expense, but quietly to allow things to take their course. After having closely calculated what it will cost to buy these possibly useless medicines, it is not uncommon, for the sick man himself to take the initiative, and decide that it will be much better to reserve the money to buy a fine coffin, since one must die sooner or later, and it is well worth while to give perhaps a short remnant of life in order to have a handsome funeral. With this sweet and consoling prospect in view, they send away the doctor, and—the sitting being prolonged—send for the undertaker. Such are the thoughts and cares that occupy the mind of a Chinese in the presence of death.—*Huc's Journey through China.*

Dealing With Offenders.

Many under our profession for want of due attention, and a perfect resignation to the Divine Teacher, have in some things manifested a deviation from the purity of our religious principles, and these deviations having crept in amongst us by little and little, and increasing from less to greater, have been so far unnoticed, that some living in them have been active in putting discipline in practice with relation to others whose conduct hath *appeared* more dishonourable in the world.

The discipline of the church of Christ, standeth in that which is pure; it is the wisdom from above which gives authority to discipline; and the weightiness thereof standeth not in any outward circumstances, but in the authority of Christ who is the author of it; and where any walk after the flesh, and not according to the purity of Truth, and at the same time are active in putting discipline in practice, *a veil is gradually drawn over the purity of the discipline*, and over that holiness of life which Christ leads those into, "in whom the love of God is verily perfected." When we labour in true love with offenders, and they remain obstinate, it sometimes is necessary to proceed as far as our Lord directed; "Let him be to thee as an heathen man or a publican." Now, when such are disowned, and they who *act therein* feel Christ made unto them wisdom, and are preserved in His meek, restoring spirit, there is no just cause of offence ministered to any; but when such who are active in dealing with offenders, indulge themselves in things which are contrary to the purity of Truth, and yet judge others whose conduct appears more dishonourable than theirs, *here the pure authe of discipline ceaseth* as to such offenders, a *temptation is laid in their way to wrangle contend.* "Judge not," said our Lord, "tha be not judged." Now, this forbidding allude *man's* judgment, and points out the necessit our humbly attending to that sanctifying pc under which the faithful experience the Lor be "a spirit of judgment to them." And a feel his Holy Spirit to mortify the deeds of body in us, and can say, "It is no more I that but Christ that liveth in me," *here right* judgn is known. And while Divine love prevails in hearts and *self in us* is brought under judgmer preparation is felt to labour in a right manner offenders; but if we abide not in *this* love, outward performance in dealing with others, generates into formality; for "this is the lov God that we keep his commandments."

J. Woolman

About Milk.—Cream cannot rise through a g depth of milk. If, therefore, milk is desired t tain its cream for a time, it should be put into a d narrow dish; and if it be desired to free it most c pletely of cream, it should be poured into a br flat dish, not much exceeding one inch in de The evolution of cream is facilitated by a rise, retarded by a depression of temperature. At usual temperature of the dairy—50 degrees of F renheit—all the cream will probably rise in hours; but at 70 degrees it will rise in perhaps l that time; and when the milk is kept near the fr ing point, the cream will rise very slowly, beca it becomes solidified.

In wet and cold weather the milk is less rich t in dry and warm, and on this account more ch is obtained in cold than in warm, though not in th dery weather. The season has its effects milk, in spring, is supposed to be the best for dri ing, hence it would be the best for calves; in s mer it is best suited for cheese; and in autu the butter keeping better than that of sum —the cows less frequently milked, give ric milk, and consequently more butter. The mo ing's milk is richer than the evening's. The drawn milk of each milking, at all times and s sons, is richer than the first drawn, which is poorest.

Males and Females in the U. S.—The late c sus revcals some very curious facts:—

The remarkable equality in the number of m and females, which is said to exist in the wo is strikingly illustrated in a table of the num of each sex, of which the particular States of their tivities have been ascertained. The male tota 6,546,753; the female, 6,558,136, which gi the latter about 11,000 majority in an aggreg of 13,000,00. But in the total population of United States, the number of females is about twenty fifth less than that of the malcs.

These figures apply only to the whites. Am the free coloured population a greater differe is observable. Of 400,000 of the latter, the Sts of whose nativities have been ascertained, th are nearly 20,000 more females than males.

With regard to the slave population, the nu bers of each sex are even more closely equal th those of the whites. The total of males is 1,6(525: and of females 1,701,778 showing a dif ence of only 700 in an aggregate of 3,000,000

This remarkable equality of numbers in a n sure necessitates a similar equality in regard ages, and conclusively settles the question t women, as general thing, are not younger t men.

Falsehoods of Exaggeration.

sides the falsehoods which people designedly , there is a kind which springs from negli- e, hastiness, or a warm imagination. Dr. iel Johnson was of opinion that most lying s from indifference about the truth, rather from a wish to deceive. People are not iently anxious to be correct; they say any g that comes uppermost, or what they think please, without reflecting whether it be strictly or not. It is a common error of tradesmen, a desire to please, or worse reasons, to pro- to have work done at a particular time when are not sure of their ability to do so, or know ively that they are not able.

any persons also, either from heedlessness, or en, say what they think will create surprise, out supposing that they are doing any harm. aps there is some truth in what they say, but so much magnified or exaggerated, with the of exciting wonder, that it has the character effect of falsehood. Such people are in t of using the words "vast, immense, grand, ndid, magnificent, superb, tremendous," and rs of that nature, when words of a more simple ning should be employed.

Father," said a boy one day, "I saw an im- se number of dogs—five hundred, I am sure the street, last night!" "Surely, not so y?" said his father. "Well, there were one ired, I'm quite sure." "It could not be," the father; "I don't think there are a hun- dogs in the village" "Well, sir, it could be less than ten: this I am quite certain of." vill not believe you even saw ten," said the r; "for you spoke as confidently of seeing hundred as of seeing this smaller number. have contradicted yourself twice already, and I cannot believe you." "Well, sir," said disconcerted boy, "I saw at least our Dash another one."

his is an example of erroneous reporting igh eagerness to make out a wonderful case. the same reason, an uneducated man, who had in the West Indies, hearing some one speak e sun rising at midsummer about four in the ning, said, "Oh, that is nothing to what he in Jamaica. I have seen him rise there be- n two and three!" This man did not know that was impossible, and that we must go to- l the poles, and not toward the tropics, in or- to see the sun rise very early.

is common, too, to hear people say that they not been so warm in all their lives; that some s gown is the prettiest they ever saw; or that never were so happy as at — Smith's party; n it is obvious that they are alleging what is ly impossible for them to be quite sure of ttle real respect for truth, and desire to follow all times, aided by a little reflection on the ning of the words we are about to utter, would us from falsehoods of this kind.

here is yet another species of falsehood, which ists in saying one thing but meaning another; ought to be at all times avoided the same as ive lying. Persons who resort to this mean tice think that, because they do not lie in the ls they use, they do not commit any actual sin or e. But this is a mere delusion. The lie is mitted by the attempt to convey a false or ng meaning for the purpose of misleading; such a mode of speaking is therefore both de- ful and sinful.

n the whole business of the world, truth is of t importance. We should not only observe it very thing relating to ourselves and our neigh- s, but we should seek to ascertain it, and hold by it, in all things. If we study history, we should endeavour to get the books of best authority. If we cultivate science, we should make sure that we receive nothing which is not satisfactorily proved. Nothing but good testimony can prove the truth of an event; and nothing but experiment, and a careful observation of facts, can prove the truth of any thing in science. We should allow no opinion to rest in our minds unless we are certain, and have taken pains to make ourselves conscientiously certain, that it is right, and not founded in error. Every wrong opinion, or supposition of what is false, tends to do harm in the world; while every thing we know for truth, and every opinion and sentiment that we know to be rightly founded, tends to the good of mankind.—*Chambers.*

Epistle of George Fox.

Next day a fresh exercise came upon me with respect to these unruly and disorderly spirits that were gone out from us, and were labouring to draw others after them into a false liberty. In the sense I had of the hurt and mischief these might do, where they were given way to, I was moved to write a few lines to warn Friends of them, as follows:

All Friends,—Keep in the tender life of the Lamb, over that unruly, puffed up, and swelling spirit, whose work is for strife, contention, and division, under a pretence of conscience, and drawing into looseness, and false liberty, dangerous to the welfare of youth. They that do encourage them, will be guilty of their destruction, and set up a sturdy will, instead of conscience, in their rage and passion; which will quench the universal Spirit in themselves, and in every man and woman: and so that Spirit shall not have liberty in themselves, nor in others, thus they shut up the kingdom of heaven in themselves, and also in others. So a loose spirit getting up under a pretence of liberty of conscience, or a stubborn will making a professing of the words of Truth in a form without power, all looseness and vileness will be sheltered and covered under this pretence, which is for eternal judgment; for that doth dishonour God. Therefore, keep to the tender Spirit of God in all humility, that in it you may know that ye are all members of one another, and all have an office in the church of Christ. All these living members know one another in the Spirit and not in the flesh. So here is no man ruling over the woman, as Adam did over Eve, in the fall; but Christ the spiritual man, among and over spiritual members, which are edified in the heavenly love that is shed in their heart from God, where all strife ceases.

J. F.

Hertford, the 11th of the Fifth month, 1678.

Singular Recovery—A few days since, in conversation with Capt. Alexander Scott, one of the pioneers in the steamboat business of the West, he gave us the following facts, which illustrate the adage that "truth is stranger than fiction." In November, 1827, he was descending the Mississippi in command of the steamer America, laden with a valuable cargo of tobacco, lead, and furs—the latter article alone worth $80,000. When near Plumb Point the steamer struck a snag, and sunk in deep water. The furs were for the most part recovered, but the boat with the rest of her cargo was abandoned and a total loss. Years passed, and the remembrance of the America's fate had faded from the recollections of all, except, perhaps, that venerable individual, "the oldest inhabitant." It is well known that the current of the Mississippi frequently changes, so that what was once the channel of that noble stream, afterwards became *terra firma*, susceptible of cultivation. This was the case with the site of the America's wreck. The channel near Plumb Point became an island, on which, for eight years, luxuriant crops of Indian corn were raised; but recently the wayward current of the Father of Waters took another turn, and commenced washing away the earthy formation, until the America was again exposed to the light of day. The lead in her hull, it is supposed, will be all recovered in good condition; the tobacco, it is fair to presume, will be slightly the worse for wet. She was sunk on the 17th of November, 1827, and consequently was imbedded for twenty-eight years.—*Pittsburg Post.*

"Resign and deny thyself wholly; for though true self-denial is harsh at the beginning it is easy in the middle, and becomes most sweet in the end."—*Molinos.*

Vanilla—The vanilla, so much prized for its delicious flavour is the product of a vine which grows to the top of the loftiest trees. Its leaves somewhat resemble those of the grape, the flowers are red and yellow, and when they fall off are succeeded by the pods, which grow in clusters like our ordinary beans; green at first, they change to yellow, and finally to dark brown. To be preserved, they are gathered when yellow, and put in heaps for a few days to ferment. They are afterward placed in the sun to dry, flattened by the hand, and carefully rubbed with cocoanut oil, and then packed in dry plantain leaves, so as to confine their powerful aromatic odour. The vanilla bean is the article used to scent snuff, flavour ice creams, jellies, &c. The plant grows in Central America and other hot countries.

The Eleventh Commandment.—At the annual exhibition of the Grammar schools of Boston, Edward Everett closed an admirable speech with the following anecdote:

The celebrated Archbishop Usher was, in his younger days, wrecked on the coast of Ireland, at a place where his person and character were alike unknown. Stripped of every thing, he wandered to the house of a dignitary of the church, in search of shelter and relief, craving assistance as a brother clergyman. The dignitary, struck with his squalid appearance after the wreck, distrusted his tale and doubted his character, and said that, so far from being a clergyman, he did not believe he could tell how many commandments there were. "I can at once satisfy you," said the Archbishop, "that I am not the ignorant imposter you take me for. There are eleven commandments." This answer confirmed the dignitary in his suspicions, and he replied with a sneer, "Indeed, there are but ten commandments in my Bible; tell me the eleventh and I will relieve you." "Here it is," said the Archbishop; "A new commandment I give unto you, that ye love one another."

The loss of our Steamships.—An interesting article in *Hunt's Merchants' Magazine* recalls events, which, at their occurrence, we thought would never be forgotten, but which, nevertheless, have passed away from the public mind. A few hearts, wounded by the deadly catastrophe, bear their ineffaceable marks, but how soon others have forgotten all!

Since 1853, twelve steamships, lost at sea, have cost 1250 human lives, and $7,250,000 of property.

The Independence sunk with 120 lives in the Pacific, and the Tennessee and the St. Louis followed, total wrecks. The Humboldt and the San-Francisco were wrecked in the Atlantic in the same year. The Franklin, City of Philadelphia,

and Yankee Blade fell in the catalogue of 1854. The City of Glasgow, with 480 lives, and the Arctic, with hundreds more precious lives, were the crowning catastrophies of that year.

In 1855, we have the sinking of the North Carolina, and the stranding of the Golden Age; which last, however, was saved and repaired. In these vessels there were 7,000 lives jeopardized, and $11,000,000 of property.

In some of these cases an irresistible power, against which no skill or foresight could be expected to guard, controlled the event; but a close examination shows not only that in a majority of instances the accident might have been averted; but that with the resources which prudent owners and officers might easily provide, the calamity might have been repaired. The waves and the winds have had some victims, but haste and improvidence have had still more.—*D. News.*

THE FRIEND.

THIRD MONTH 1, 1856.

The facts and observations relative to the "Wind and Current Chart," published in the present number, will we think, interest our readers, and so great is the benefit arising from the extended series of meteorological observations carried on in all parts of the aqueous globe, that it is proposed to extend the system to the land as well as the sea, so that agriculture may be benefited by the scientific discoveries made thereby, in the same manner as maritime affairs.

Lieutenant Maury suggests that farmers should be engaged in various sections of the different States, to co-operate in prosecuting a regular and systematic method of meteorological observations, and to transmit their accounts to Washington at stated periods, where a competent agent should be employed by the general Government to arrange the facts and observations for publication. The plan is simple, and can be readily carried out by enlisting a sufficient number of intelligent agriculturists, and having them supplied with uniform tables to be filled up with the result of observations made at different points in the twenty four hours, and we cannot doubt that the deductions from the cumulative facts would be highly instructive and practically useful. Lieut. Maury seems to have no doubt of the plan succeeding. In a letter to a friend he says:—

"As for giving the scheme a trial, and carrying it into a demonstration far enough to show what a systematic plan of observations will do for the advancement of agricultural meteorology, and for the benefit of farmers and planters, I'll answer for the observations, if government will pledge the means for their discussion and publication. I'll go further, and promise that the observations shall be furnished to the government for such a purpose *without cost.* You know the materials for the 'Wind and Current Charts' were all furnished gratuitously, and that, without asking government for a single cent, we have literally covered the ocean with floating observatories, and converted every ship that sails into a temple of science. Not only government, but nations and people have united with me, and are assisting to carry out a system of meteorological research for the sea. As much may be done for the land, if the planters and farmers of the United States will only second the effort, and tell their Representatives in Congress that they want as much done by the government for agricultural and sanatary meteorology as it has *permitted* to be done at sea for the benefit of commerce and navigation. By the saving of time on the voyage, and the lessening of the dangers by the way, these interests, it has been computed, both in this country and in England, have been benefited to the extent of millions annually. Some of these benefits have inured also to agriculture, not only by giving an opportunity to the farmer to get markets beyond the sea cheaper, and enabling ships to fetch and carry for him at lower figures, but by bringing within reach markets which before were inaccessible by reason of the great length *in time* of the voyage."

SUMMARY OF EVENTS.

EUROPE.—The steamship Asia arrived at New York on the 24th ult., with European dates to the 9th. The Atlantic which left Liverpool on the 6th, arrived also on the 24th. The Atlantic met strong westerly gales for ten days in succession, and was for three days in large fields of ice. Nothing is known yet of the fate of the steamship Pacific, which sailed from Liverpool on the 23d of First mo. Her passengers were 45 in number. The protocol for the preliminary Congress at Paris, had been signed, and it is reported that the Emperors of Russia and Austria will visit Paris during the Conferences. An armistice from land operations only, will probably be agreed upon. The Journal des Debats has a long and laboured editorial to prove that up to the present point, the interests of France and England are identical, but that the continuance of the war, either on the Baltic or in Asia, would only subserve the private interests of England. The British government has sent, by the Asia, presents of plate, medals, &c., for the officers and crew of Dr. Kane's Expedition. Letters from Hamburg, dated the 3d ult., state that eleven cargoes of sulphur, three of saltpetre, and two of lead, had arrived there during the week, destined for Russia. Some of the vessels were English. A severe storm occurred on the British coast on the night of the 7th ult., attended with many disasters to shipping. The tone of the British press, in reference to the matters in dispute with the United States, is unfriendly, and tends to keep up excitement, but there seems no reason to doubt that the government is peaceably inclined and disposed to remove all the causes of difference. The Liverpool cotton market has slightly declined for middling qualities; the other grades were unchanged. The sales of the week were 58,000 bales. A further decline in breadstuffs had taken place. Red wheat was quoted at 9*s.* 6*d.*, and white, 10*s.* 9*d.* per 70 lbs. Western Canal flour, 34*s.* Southern, 36*s.* to 37*s.* Corn was dull, with a downward tendency. The London money market was more stringent. Consols, 91 to 91⅜.

INDIA.—Bombay dates to First mo. 2d, state that the Santhal insurrection had been suppressed; quiet reigned throughout India. Great Britain is about to seize the Kingdom of Oude; to allow its king a pension of half a million of dollars; to reduce its army from 80,000 men to 15,000, and to appoint the English General, Outrane, Governor of the country. The country thus summarily annexed, contains about twenty-four thousand square miles; is mostly level with a highly fertile soil, and contains a population of nearly three millions.

UNITED STATES. — *Immigration for 1855.* — The number of immigrants arriving from foreign countries for the year 1855, was 230,476, of whom 140,000 were males. Of the whole number, 166,562 arrived at New York.

Congress.—But little business has yet been done in either the Senate or the House. The latter body has elected as Chaplain Daniel Waldo, of New York. He was a revolutionary soldier, and is in the 94th year of his age. The principal subjects of discussion in Congress, are the Central American question, in the Senate, and Kansas affairs, in the House. From the documents laid before Congress by the President, it appears that his interference to prevent the apprehended invasion from Missouri, had been earnestly invoked by the leaders of the Free State party in Kansas, and that they have demanded that the U. S. troops in their vicinity should be instructed to protect them from it. Later advices from the territory are more pacific, and it was hoped the Missouri borderers would be restrained. Governor Shannon was instructed to notify them that their invasion would be resisted by the U. S. troops, and also to inform the Free State party in Kansas, that any insurrectionary movement on their part will be met in the same way.

Philadelphia.—Mortality last week, 193. At a census of the Almshouse taken a few days since, it was found there were 2392 inmates; at the same time last year there were 2639. The whole number receiving out door relief, was 2567, of whom 1312 were Americans and 1255 foreigners. Some experiments were made last week to ascertain the effect of powder in breaking up the ice in the Delaware, which was still about twelve inches thick. It was tried sunk below the ice in canisters in various quantities from one pound to forty, and exploded by galvanism. But little effect was produced, the openings resulting being quite small, and not accompanied with any extensive fractures of the ice.

The Restraining Law.—The Pennsylvania Senate has passed a bill substituting a stringent license law for that of last session. On its final passage, the vo 19 to 11. The bill has been referred to a selec mittee by the House of Representatives.

Miscellaneous.—An Old Newspaper.—The olde nal in Holland, the Haarlem Courant, on the 8 attained the respectable age of two hundred year upwards of one hundred years this journal ha uninterruptedly in the possession of the family present publishers, Johannes Enschede & Co.

Lake Michigan Frozen Over.—The Chicago (Il mocrat says:—"It is asserted that Lake Michi frozen completely over from one side to the other. if a fact, has never occurred before in the mem the oldest inhabitant. With the best glasses, fr ther side of the lake the clear water cannot be se

Profits of City Railroads.—The Sixth Avenu Railroad, New York, has just made its annual r showing a net profit of $68,818, or about nine pe on the capital stock of $750,000.

Pardon of Indians.—The President of the U States has pardoned the five Indians held in co ment at Fort Leavenworth, charged with the mur the mail party near Fort Laramie last year. men were delivered up by their tribe to General H for confinement and trial.

Fremont's Claim.—Col. Fremont's warrant fo Mariposa tract of land in California, has at last signed by the Land Commissioner.

Slavery in the Supreme Court.—The opinion o U. S. Supreme Court in the slave case, which inv the Missouri Compromise, &c., will not be delivere til the Court reassembles in the Fourth month.

Freshet in the Ohio.—On the 23d, a freshet comm in the Ohio, breaking up the ice opposite Cincin and causing great destruction among the steam and other vessels. Seven steamboats were sun gether with many flat boats and barges.

The Grain Market.—Late foreign news has depr and unsettled prices. On the 25th, the quotations as follows: *Baltimore*—Yellow corn, 54 cts. to 57 wheat, $1.55. Howard street flour was held at $ buyers offering $6.25; no sales. *Philadelphia.*—He ask 60 cts. for new yellow corn, but only 50 c offered; flour for shipping is held at $7.00, but h offer only $6.75. *New York.*—Sales of 2500 barr $7, for State; $8, for Ohio; and $8.81, for Sout No sales of wheat. Sales of 16,000 bushels of n corn at 75 cts.

Death of Paskiewitch.—This celebrated Russian G ral died at Warsaw on the 1st ult. He was in his year, and had filled the office of Viceroy of Polan some time previous.

RECEIPTS.

Received from Elijah Haworth, O., $2, vol. 28 Jordan Ballard, $2, vol. 29, for Jos. Burgess, $1, vol. 29; from Mark Willits, agt., O., $2, vol. 29, an Jas. M'Grew, F. M'Grew, A. M'Grail, John Hoyle, je each, vol. 29; from Asa Garretson, agt., O., for Bailey, $2, vol. 29, for Jas. Gibbons, $2, to 20, vol. from H. and E. Hedley, N. Y., $2, to 25, vol. 30.

WANTED.

A suitable Friend and wife, to superintend the sch and manage the farm belonging to Adrian Quar Meeting, Michigan. Apply to Richard Harkness, Ad or Samuel Satterthwaite, Tunessassah, Mich.

Friends' Boarding-School for Indian Children, a Tunessassah.

Two women Friends are wanted at this Institutic assist in the family.

Also, a man Friend to aid in carrying out the cern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTO 377 S. Second st
THOMAS EVANS,
Philad., Eleventh mo. 1st, 1855. 180 Arch st

WEST-TOWN BOARDING SCHOOL.

Wanted, a Teacher of the Classical Department in Institution.

Application may be made to either of the undersig members of the Committee.

For "The Friend."

correspondent in Washington county, Ohio, has cheered us by his approving remarks rela- to "The Friend," to which he has been a sub- er about seventeen years, requesting the re- ication of the following narrative taken from a to work by M. Howitt, we willingly comply. peared in one of the early volumes of this nal.—EDITORS.

Martha and Mary.

was when the persecution of the people called kers had, for a short season, somewhat abated gour, and they ventured to attend their reli- s assemblies without fear of injury to their llies in the meantime, that Walter Pixley and ife, a staid and respectable couple belonging hat despised community, rode eleven miles to e county town of Stafford, to be present at a ding, at which that apostle-like young man, ard Burrough, was to preach, leaving their daughter Martha under the care of an aged an, who was, at that time, their sole female estic.

Martha was a grave child, though but seven s of age: her young mind had taken its tone h both of her parents. She had been born in ason of persecution, had been cradled, as it e, in anxiety and sorrow; and as she grew enough to comprehend the circumstances that ounded her, she saw her parents constantly d with apprehension for the safety of their s and property. She had heard them talk over r grievances, spoiling of goods, the maimings, whippings, and the horrible sufferings of their ecuted brethren, persecuted even to the death; heard of little children enduring, with the stead- ness of early martyrs, imprisonments and pains, ch would overcome even the strong man; till, ke the ordinary child of her years, her counte- ce habitually wore a look of gravity, and her rt bled at the least thought of suffering or ow.

Martha's home was in a country place, sur- nded by fields—a pleasant quiet valley, the rimonial heritage of her father. It was harvest e, and in the course of the morning the old rant went out with the reapers' dinners, leav- little Martha to amuse herself in her usual et way. She had not been long alone, before eggar-woman presented herself with a young ld in her arms. Martha knew that it was her ther's custom to relieve distress in whatever pe it presented itself, and the story the woman d, whether false or true, touched her to the soul; she gave her, therefore, the dinner which had been set aside for herself, and compassionated her in words of the truest sympathy; and when the child in the woman's arms wept, her heart yearned towards it. Strange it may be to all, but so it was, for our story is true, when the beggar-woman saw the affection with which little Martha regarded the child, she proposed to sell it to her, and Martha, innocent of all guile, readily accepted the proposal. All her little hoard of money was produced, the bargain was struck, and the two parted perfectly satisfied with the transaction. The child was beautiful in its form and features; and Martha sat down with it upon her knee, and lavished upon it all the endearing tenderness which her most affectionate nature suggested.

In a short time the child fell asleep; and as she sat gazing upon it, a half-defined fear stole into her mind, that perhaps she had done wrong in taking upon her this charge unknown to her parents, that perhaps they would be displeased. She rose up in haste and looked from door and window for the beggar-woman, but neither across the fields, nor down the valley, nor upon the distant highways, was she to be seen; and then she was afraid, and thought to hide the child. She made it a comfortable warm bed with a blanket, in a large press, and kissing its sleeping eyes, and wishing that she had no fear, she left it to its repose, and began with great anxiety to look out for the return of her parents. To the old domestic she said not one word of what she had done.

After two hours, all which time the child had slept soundly, Walter Pixley and his wife returned. The good mother, who was accustomed to help in all the domestic business, employed herself in preparing the early afternoon meal, and Martha sat down with her parents to partake of it. While Walter Pixley and his wife were in the midst of their review of the events of the morning —of Edward Burrough's extraordinary sermon, and of the concourse to whom it was addressed, they were startled by what seemed to them the cry of a child. Martha's heart beat quick, and her sweet face grew suddenly pale, but her parents were not observing her. The good man stopped in the middle of a sentence, and both he and his wife turned their heads towards the part of the house whence the sound proceeded, listened for a second or two, and then, all being again still, without remarking upon what they supposed was fancy, they went on again with their conversation. Again a cry louder and more determined was heard, and again they paused. "Surely," said the wife, "that *is* the voice of a young child."

The critical moment was now come—concealment was no longer possible; and Martha's affection mastering her fear, as the infant continued to cry, she darted from the table and exclaimed, "Yes, yes, it is my child!" and the next moment was heard audibly soothing her little charge, in the chamber above, with all the tenderness of the fondest mother.

M. Pixley was soon at her daughter's side, full of the most inconceivable astonishment, and demanded from her whence the child had come, or how it had been consigned to her charge. Martha related the story with perfect honesty. The old domestic was then summoned, but she knew nothing of the affair. They were not long deliberations that followed. The family could not conscientiously burden themselves with another dependent, and one especially who had no natural claim upon them, in these perilous and anxious times, when they could not even insure security for themselves; and besides this, how did they know but this very circumstance might be made, in some way or other, a cause of offence or of persecution—for the world looked with jealous and suspicious eyes upon the poor Quakers. Father Pixley, therefore, soon determined what he had to do in the afternoon—to make the circumstances known at the next village; to inquire after the woman, who, no doubt, had been seen either before or after parting with the child; and also to state the whole affair to the nearest justice of the peace.

Within an hour, therefore, after the discovery of the child, the good man might be seen making known his strange news at the different places of resort in the village, and inquiring from all if such a person as the little girl had described the woman to be, had been seen by any; but, to his chagrin and amazement, no one could give him information—such a person had evidently not been there. He next hastened to the justice's. It was now evening, and Walter Pixley was informed that his worship very rarely transacted any business after dinner, and that especially "he would not with a Quaker." Walter, however, was not easily to be put by; he felt his business was important, and, by help of a gratuity to the servant, he gained admittance.

The justice was engaged over his wine, and he received Walter Pixley very gruffly, and in the end threatened him with a committal to jail for his pains. The poor Quaker had been in jail the whole of the preceding winter, and he remembered too wofully the horror of that dungeon to bring upon himself willingly a second incarceration. It was of no use seeking for help at the hands of the justice; therefore he urged his business no further, and returned quietly to his own house.

Against the will, therefore, of the elder Pixleys, the child was established with them; and it was not long before the father and mother as cordially adopted it as their little daughter had done from the first beholding it. "For who knows," argued the good Walter Pixley, "but the child may be designed for some great work, and therefore removed thus singularly from the ways of evil for our teaching and bringing up? Let us not gainsay or counteract the ways of Providence." This reasoning abundantly satisfied the pious minds of the good Friends, and the little stranger was regularly installed a member of the family by the kindred name of Mary.

At the time little Mary was first received under this hospitable roof, she might be about six months old, a child of uncommon beauty; nor, as the months advanced into years, was the promise of her infancy disappointed. She was, in disposition and tone of mind, the very reverse of her grave and gentle sister, as Martha was now considered; she was bold and full of mirth; full of such unbroken buoyancy of heart as made the

sober mother Pixley half suspect that she must have come of some race of wild people. Certain it was, the subdued and grave spirit of the Pixleys never influenced her; and as Martha grew up into womanhood, and the quietness and sobriety of her younger years matured into fixed principle, she embraced with a firm mind the peculiar tenets in which she had been brought up, and would have stood to the death for the maintenance of them. Mary also advanced past the years of girlhood, but still remained the gay, glad, bold-spirited being that she had ever been. She revered all the members of the persecuted body to whom her friends belonged, and would have suffered fearlessly for their sakes; still their principles and practices she never would adopt. Her beautiful person was adorned, as far as she had opportunity, in the prevailing fashion of the times; and she often grieved the sober minds of every member of the family, by carolling forth "profane songs," as mother Pixley called them; while how she became acquainted with them remained for ever a mystery. Often did the conscientious mind of father Pixley question with himself, whether it was quite right to maintain so light a maiden under his roof; but then the affectionate being, who had no friends save them in the world, had so entwined herself round the hearts of all the household, that the good man banished the idea as inhuman, and never ventured to give it utterance. Martha and her mother, meantime, strove to win over this bright young creature to their own views, and for a few moments she would settle her beautiful face to a solemn expression, try to subdue what her friends called "her airy imagination," and attend the preaching of some eminent Friend. But it would not do—the true character burst forth through all—Mary was again all wit and laughter, and though her friends reproved, they loved her, and forgave all.

On the accession of James II., which is the period at which our little narrative is now arrived, persecution raged again with greater violence than ever; and the Pixleys, along with seventeen other Friends, both men and women, were dragged from their meeting-house by a brutal soldiery, under the command of the justice we have before mentioned, to the dungeon-like county jail, in the depth of winter. The hardships they endured were so dreadful that it is painful to relate them. They were kept many days without food, and allowed neither fire nor candle; their prison was damp and cold, and they were furnished with straw only for their beds; they were also forbidden to see their friends, who might have procured them some of the necessaries of life; nor were they allowed to represent, by letter, their case to any influential man of the county, who might have interested himself in their behalf. And to all this was added the brutality of a cruel jailer, who heaped upon them all the ignominy he could devise. In these dreadful circumstances lay the gentle Martha Pixley and her parents. Mary, not having accompanied them to their place of worship, did not share their fate.

Poor mother Pixley's health had long been declining, and this confinement reduced her so low that in a few days her life was despaired of:—still, no medical aid could be procured, and the cloaks and coats of many of her suffering companions were given up to furnish covering for her miserable bed.

(Concluded next week.)

The Largest Nursery in America.—The nurseries in the vicinity of Rochester, N. Y., are the most extensive on the continent. From only a few acres in extent, as they existed fifteen or twenty years since, the nurseries within ten miles of the city now cover at least one thousand densely planted acres. The cost and annual product of these nurseries may be reckoned with some degree of accuracy by taking as the basis of calculation the estimates of several intelligent nurserymen of that place—that a *well managed* acre would yield, as an average, from two to three hundred dollars—the expense varying from fifty to seventy-five per cent. of this amount. It would, of course, be greatly controlled by the kind of trees raised, the proportion of ornamentals, &c, but still more by the judgment, energy and skill exercised by the manager—for under the direction of some the cost exceeds the profits, and the business consequently soon comes to an end.

From Old Humphrey's Portfolio.

Hallelujah.

There are some words that require others to make them intelligible; some are perfect in themselves. Some have but little force and meaning when they are understood; others are full of power and significancy—of this latter kind is the word hallelujah! or Praise ye the Lord!

But hallelujah is not only a word, but a sentence and a song. Does the lowliest sinner, melted with a sense of the grace and mercy of his redeeming Lord, attempt to give utterance to thankfulness of his heart? His language is hallelujah. Does the highest archangel desire to magnify the name of him that sitteth on the throne of heaven? a hallelujah bursts from his lips, resounding through the mansions of the skies. Hallelujah is the language of sinners and saints, men and angels, earth and heaven, "Praise ye the Lord; O, give thanks unto the Lord; for he is good; for his mercy endureth forever." Psa. cvi. 1. Hallelujah is thanksgiving, praise and exultation. Fill the heart with hallelujahs, and it will give glory to God in the highest, and manifest good will to men. It has been said that it would be no bad method to find out the lawfulness or unlawfulness of our pleasures, and the spiritual or worldly state of our affections were we to ask ourselves this question in the midst of every enjoyment, "Can we put up a hearty hallelujah at the end of it?"

When we regard ourselves and our Almighty Maker—when we look at our lowliness and his loftiness, our weakness and his power, our folly and his wisdom, our exceeding sinfulness and his unsullied holiness, well may we lie down in the dust; and when from the dust he lifts us up—when from the dung-hill he raises us to be princes, can we do less than offer him our reiterated hallelujahs!

Let earth and heaven his righteous praise resound,
And endless hallelujahs echo round.

The young should praise the Lord for their youth, and for the hopeful prospect that is before them of health and length of days. The old should praise the Lord for their years, and for all the benefits bestowed on them in their past pilgrimage. Those who have neglected to call on the Lord, have cause to thank him for his forbearance in allowing them time for repentance. And such as have been taught that the Lord is gracious, and full of compassion, even to the pardoning of their sins, being justified through faith in the Son of God, and sanctified by his Spirit, should be loud in their thanksgiving: so that the young and the old, the awakened and the unconverted, have reason to mingle together their hallelujahs.

Hallelujah is the aspiration of a spirit longing to manifest its grateful emotions, and to glorify the High and Lofty One that inhabiteth eternity. The incense of praise is an acceptable offering to him, and Christians should be ready at all to raise a real "*Non-Nobis*," a true and h "Not unto us, O Lord, not unto us, but unt name give glory, for thy mercy, and for thy t sake." When the kingdoms of this world be the kingdoms of the Lord, praise will be th versal language. The people will rejoice in th giving,

And countless millions, join the sacred song,
And hallelujahs burst from every tongue.

Do you love the Lord? Where are you lelujahs? Do you praise him for your con mercies, for the faculties of your body, soul spirit, renewed as they are day by day?—fo food, water, and the light and warmth of th glowing in the skies? Do you praise hin spiritual blessings, a mercy-seat, the mea grace, and the hope of glory through the atc sacrifice of Jesus Christ? The love to God has no hallelujah, may well be doubted, an hallelujah that has no love to the Lord, is a dow, a deception, a mockery. The grateful will speak, and so long as there are pardoned ners in the world, so long will ardent hallelu ascend to the skies.

There are different kinds of hallelujahs, the loud and triumphant shout, "The Lord Omnipotent reigneth," to the lowest whis praise. Nay, there are inaudible hallelujahs heard by the ears of men, but clear and inte ble to him who receiveth the sighing of the soner, who knoweth the desires of the heart, by whom a book of remembrance has been wr for such as fear the Lord, and think upon name. The lowest thanksgiving of the low repentant sinner, will be accepted at that heav throne,

"Where pure devotion meets with equal grace,
Wrapp'd in the simple strains of human prais
Or bursting from the seraph's lip of fire."

It is a good thing to give thanks unto the L and to sing praises unto the name of the High. Day after day ascend psalms, and hy and spiritual songs to the heavenly throne. cannot truly praise God without feeling tha have something to praise him for; nor can know ourselves, without knowing that we to praise him for everything.

Reader! the [holy Scriptures] tell us, that time is short; that there is but a step betwee and death, and that we shall all stand before judgment-seat of Christ. Man, dead in trespas and sins, was lost, and none but an Almi Saviour could have redeemed him. The sacr offered up on the cross demands not the ser of the lips only, but the humble acknowledgn of the spirit, not the hetacombs of the altar, the hallelujahs of the heart. Have you sorro for sin? Have you fled to the only sure re from eternal wrath? If not, clouds and dark are around you, and death, everlasting death, in your path. Give no sleep to your eyes, slumber to your eyelids, till the danger is the battle fought, and the victory obtained thro Christ; for then will you indeed greatly rejo and then will you raise your hallelujah.

Hark! there are tidings of great joy. A som has been paid for sin; a Saviour has suff for sinners. There is a crown of righteous laid up for those who love the Lord. Are yo new creature in Christ? Has faith in his ator blood been given you, and a holy determina to live in him and in all things to do his will? and are you rejoicing in the hope of ete life? Then the language of your lip and hear and will be, nay it must be Hallelujah! "Pr ye the Lord. Praise God in his sanctuary: pr

in the firmament of his power. Praise him his mighty acts; praise him according to his llent greatness. Let everything that hath th praise the Lord. Praise ye the Lord!" cl. 1, 2, 6. Hallelujah!

For "The Friend."

Japanese Gulf-Stream.—Lieut. Bent, of the S. Navy, recently read a paper before the Geological and Historical Society, New York, in ch he showed, from the records kept by the an expedition, that there is also in the Pacific River of the Ocean," flowing to the northward eastward along the coast of Asia, correspondin every essential particular with the Gulf am of the Atlantic. There is an increased perature of both the air and water the moment oceanic stream of that region is entered, but edominant thermal change in the water, which ost invariably continues superior in temperato that of the air, until leaving the stream n. It is caused by the great equatorial curof the Pacific. Along the coast of Formosa trength and character are as decidedly marks those of the Gulf Stream on the Florida coast. greatest velocity is in the Gulf of Yeddo, where eighty miles per day. Its average velocity is 30 to 40 miles per day. Lieut. B. attributes mild climate of Japan and California to the ific stream, and said the Gulf Stream has not ilar influence upon our coast, because the current flowing South intervenes between it the shore.

Tunnels.—The United States has 67 tunnels on ls and railways, the longest of which is about mile.

England has 48 canal tunnels, of an aggregate gth of 40 miles, the longest being over three es, on the Huddersfield Canal. She has also railway tunnels, 49 of which amount to 33 s, the longest being three miles.

The longest tunnel is one in the district of emnitz, in Hungary. Its length is variously ed at from 10½ to 11½ miles. It is used to in an extensive series of mines, and also for the sportation, of ore on railway cars.

In France there are 56 tunnels on railways, and n canals, 36 of which are an aggregate of 45.4 es. The largest of small size is 7.45 miles, and t of large dimensions 3.5 miles. The Rouen Havre Road has 8 tunnels; Paris and Lyons 8.

On the German railways are 10 tunnels.

In Sardinia there is a tunnel two miles long, ough Mt. Giovi, on the Genoa and Turin Rail-y. On this road, in 25 miles through the Appe-es, are 9 tunnels.

For "The Friend."

The following extract, is from a letter of the e Martha T. Sharp, of Salem, N. J., a much eemed and consistent member of the Presbyian Society of that place; she died in the 17th ar of her age. The letter was addressed to an rly friend and schoolmate, and appears to have oduced a very deep and lasting impression.

R.

"I take it for granted you are interested in *my* airs. Are you not, dear Mary? I can imagine ur silent assent. I will carry the question still far-er, and ask, will you please to be interested in I am going to say, and weigh it carefully be-re you throw it aside perhaps for ever?

"You ask me about dancing; and perhaps you, ll think me too strict when I tell you, that *as a hristian*, I cannot approve of it. It is perfectly onsistent with the character and aims of those ho profess to live only for this world. But for those who, having 'cast away the works of darkness,' are *pressing forward* 'to the mark for the prize of the high calling of God in Christ Jesus,' to countenance and *enjoy* it, is wrong, decidedly wrong. I do not speak of the 'charm of so light and graceful an amusement,' I suppose, in itself considered, and as an exercise, there is probably no harm in it. But could a Christian go from prayer to a dance? Or could he return from it and with a peaceful and happy heart, bow before Him who is of pure eyes, and cannot look upon sin but with abhorence? Ah? my Mary, think of it in this light. Do not parley at the positive amount of harm it contains. But reflect upon the high calling of a Christian, Think of the glorious home to which he is hastening, and for which he is preparing; of the Saviour, the saints and angels with whom he is to live eternally; and answer me conscientiously, does this amusement advance him one step in his life of preparation? Does it make him any more meet for the kingdom of heaven? Does it not rather lead him away from God, and fix his affections on this world? Oh! how anxiously do I wish you to think as I do! you are not happy, and it grieves me to find it so. The tears that are in my eyes now, are not the first that I have shed for you, and the prayer with which I have written this letter, is one of a thousand of the same character. Your *only* happiness is in novels and company! Oh! do seek for a better kind. Go, I beseech you, to your heavenly Father; confess your sins: say, 'Lord, if thou wilt, thou canst make me clean.' Give him your whole heart: renounce every sin, taking up every duty: solemnly dedicate yourself to God, and Oh! may the God of grace help you to keep his laws! The Saviour is waiting to be gracious. Can you, will you, refuse to accept his proffered mercy? I am distressed for you. Do, Oh! please do, give yourself to the Saviour. If you will only do this, you will experience that peace which passeth all understanding." M. T. S.

Locomotives.—When locomotives were first built, they weighed less than five tons. This was in 1828; since then passengers and freight have increased, car after car has been supplied for their accommodation, and ton after ton has been added to the weight of the engine, in order to enable it to move the additional burden imposed upon it, until those of the largest class upon the English roads have attained to the enormous weight of 32 tons, and in the United States to between 20 and 30 tons. The first locomotive performed 28 miles an hour. They now perform from 40 to 80 miles. This increase shows a rapid improvement. The first locomotive cost $3000. The St. Clair, belonging to the Hudson River Railroad, cost $12,500. The first locomotive used in the United States, was the "John Bull," on the Albany and Schenectady Railroad. This engine is now at the Albany Nail Factory, where it is kept as a curiosity.

Epistle of George Fox.

Dear Friends,—Let the holy Seed of life reign over death and the unholy seed in you all; that in the holy Seed of the kingdom, ye may all feel the everlasting holy peace with God, through Christ Jesus your Saviour, and sit down in Him, your life and glorious rest, the holy rock and foundation, that standeth sure over all from everlasting to everlasting, in whom all the fulness of blessedness is, so that ye may glory in Him that liveth for evermore, Amen! who is your eternal joy, life and happiness; through whom you have peace with God. This holy Seed bruiseth the head of the serpent, and will outlive all his wrath and rage, malice and envy, who was before he and it were, and remains when he and it are gone into the fire that burns with brimstone. The Seed, Christ, will reign; and so will ye, as ye do live and walk in him, sit down in him, and build up one another in the love of God. G. F.

Hertford, the 10th of the Fifth month, 1678.

ONLY WAITING.

A very aged man in an almshouse, was asked what he was doing now. He replied, "Only waiting."

Only waiting till the shadows
Are a little longer grown;
Only waiting till the glimmer
Of the day's last beam is flown;
Till the night of earth is faded
From the heart, once full of day;
Till the stars of heaven are breaking
Thro' the twilight soft and gray.

Only waiting till the reapers
Have the last sheaf gathered home;
For the summer time is faded,
And the autumn winds have come.
Quickly, reapers! gather quickly
The last ripe hours of my heart,
For the bloom of life is withered,
And I hasten to depart.

Only waiting, till the angels
Open wide the mystic gate
By whose side I long have lingered,
Weary, poor, and desolate.
Even now I hear the footsteps,
And their voices far away;
If they call me, I am waiting,
Only waiting to obey.

Only waiting till the shadows
Are a little longer grown;
Only waiting till the glimmer
Of the day's last beam is flown,
Then from out the gathering darkness
Holy, deathless stars shall rise,
By whose light my soul shall gladly
Tread its pathway to the skies.

Selected.

THE WORTH OF HOURS.

Believe not that your inner eye
Can ever in just measure try
The worth of hours as they go by:

For every man's weak self, alas!
Makes him to see them while they pass,
As through a dim or tinted glass:

But if in earnest care you would
Mete out to each its part of good,
Trust rather to your *after mood*.

Those surely are not fairly spent,
That leave our spirits bowed and bent
In sad unrest, and ill content:

And more—though free from *seeming* harm,
We rest from toil of mind or arm,
Or slow retire from pleasure's charm—

If then a painful sense comes on
Of something wholly lost and gone,
Vainly enjoyed or vainly done—

Of something from our being's chain
Broke off, nor to be link'd again
By all mere memory can retain—

Upon our hearts this truth may rise—
Nothing that altogether dies
Suffices man's just destinies:

So should we live that every hour
May die as dies the natural flower
A self-reviving thing of power;

That every thought and every deed
May hold within itself the seed
Of future good and future meed.

Esteeming sorrow, whose employ
Is to develope, not destroy,
Far better than a barren joy. *Milnes.*

"The times may look dark to sense, but faith says it shall be well with the righteous."

For "The Friend."

Early Anti-Slavery Advocates.

BENJAMIN LAY.

(Continued from page 196.)

Of the personal habits of this indefatigable labourer for the slave, we are informed that he practised temperance and frugality. His drink was milk or water, and his other food was altogether vegetable. He spun tow, and of this, woven into cloth of its natural colour, his clothes were made. He would not eat flesh, because he did not think it right that animal life should be sacrificed, to satisfy the appetite of man. Neither was he willing to partake of, or make use of anything that had been raised by slaves, or in the preparation of which their labour had been employed. After spending so much time in tilling the ground, in spinning tow, or such other employment as he deemed necessary to ensure him the small amount of food and raiment sufficient for his slender wants, he dedicated the rest to the crusade he was carrying on against all unrighteousness and cruelty. He was often in Philadelphia, labouring particularly amongst Friends. Robert Jordan, a valuable minister of that day, was one of the objects of his most earnest attacks, not only because he was a practised minister of the gospel, and yet did not denounce all communion with slaveholders, but because some of the communications from Colchester respecting the irregularity of the certificate for B. L. and wife, were addressed to him. Benjamin thought that Robert and some others had procured the separate certificate for his wife, and in so doing, had a mind to separate them.

The violence of his feelings towards those he thought concerned in this matter, is manifested on several occasions; he says, "I shall leave them to the great Judge of heaven and earth. If he be pleased to forgive them, I hope I shall, *in time*." Benjamin had now taken upon himself to preach in meetings for worship, and to intrude into meetings for discipline, so that at last at the Quarterly Meetings held at Burlington, Philadelphia, Concord, and some other places, they were obliged to have doorkeepers specially appointed to keep him out. His zeal against a dead, lifeless ministry, was very great, and his remarks thereon are striking. If he had had as correct an appreciation of his own offerings of the kind as he had of others, his friends would have had less trouble with him. He says, "It seems as if some of our ministers, I was going to say many, have forgot the great benefit of silent meetings, if ever they rightly knew it, they are so restless in them, and must be hammering and hammering. The noise of the workman's tool was not to be heard in building the outward temple, and much less the inward, which is the work of God himself. Oh, that the Lord would be pleased to put a hook into the nose of this Leviathan! But if the words be never so sound and orthodox, without life they are but as chaff; and what is the chaff to the wheat? Why, truly, Friends, you know the chaff is for the beasts, but the blessed wheat, with which our heavenly Father feeds his babes, is for the children of the kingdom, New Jerusalem, the church of the living God. What said the blessed Jesus, 'He that is not with me, is against me, and he that gathereth not with me, scattereth abroad.' As if he had said, Let his or her words be ever so excellent. Many worthy Friends have been burdened with this scattering spirit for many years, especially its profaning, if not blaspheming, the sacred name, in prayer. When our meetings, on First-days or others, are a little settled in silence, and the children of the kingdom, in their heavenly places, and their Father begins to feed them, up stands, it may be a cracked trumpet, with an uncertain sound; or peradventure an old broken cistern, with a little thick muddy stinking water at bottom, kept in for the meeting, and there thrown out among the children, when in truth, it is hardly fit for swine."

Benjamin wrote with much severity, and yet we cannot doubt but that he thought he should do good. He probably was not at all conscious how much animal heat and excitement mingled with, and added intensity to the real christian testimony he had to bear against slavery. After some sharp language written, Seventh mo. 5th, 1736, against slave keepers, he adds, "I can truly say with great sincerity; I write these things, not to offend, but to inform, caution, and advise them that are concerned, to pray to the Lord for wisdom and strength of faith, to quit their hands of them before it is too late; a day of vengeance will come." "O! that my soul could find some relief for the distress that it hath been in, at times, for seventeen years and more, on this sad account. But if Friends will not hear, O believe me, mine eyes shall weep sore in secret." "A glorious and precious thing, indeed, is true unity; but I know no stronger bulwark the devil has against it, in the church of Christ, than slave keeping." In connection with unity, he quotes from a forcible writer the following pithy sentiment. "Where the truth of God suffers, there unity is schism, church government is tyranny, and the church is a rout."

In the same month, he says, "My joy and the crown of all my sweet delights in this world, I can truly say, is the true unity with my brethren, which are in God the Father, and he in them, ever reigning in his own blessed kingdom, body, house, tabernacle, New Jerusalem, or tent—synonymous terms. While Israel abode here, no divination could prevail, or enchantment against them. But when Israel, our dear friends, went out of their tent to look at, and long after the pleasures, pride, profit and friendship of this world, then they came to be snared with this cursed sin, negro-trading, as well as some other." He then goes on to describe from the accounts given him by those who had been engaged in negro-stealing on the African coast, the manner in which they obtained their cargoes. After stealing all they can catch, with their boat's crews by the sea side, and in the rivers, they, he adds, "find out some old negroes that they have been used to trade with, which will bring off in canoes, their wives, or children, or their neighbours' wives and children if they can catch them in the woods, or anywhere else, to sell to our brave Christians. O brave! give 30s. for a negro, and sell him for £30 or £40, 50 or 60, 70, 80, 90, £100 or more. Who would but be a trader in slaves and souls of men, although he go to hell for it!"

In the year 1729, at the suggestion of Chester Quarterly Meeting, the Yearly Meeting directed the several Quarterly Meetings to consider and report whether Friends ought not to be restricted by discipline from purchasing slaves, as they already were from importing them. In 1730, Philadelphia Quarter referred the matter to the decision of the Yearly Meeting, which they expected would review and consider the minutes formerly made against slavery. Bucks Quarter leaves "it to the Yearly Meeting to determine as in the wisdom of Truth shall be seen meet." Burlington, after seriously and deliberately weighing the matter, give it as their opinion, "that as it is not agreeable to our discipline to be actually concerned in importing of them into these countries in order to make slaves of them, so consequently it cannot be agreeable to buy them, when imported, because that has a manifest tendency to encourage the importation of them. Yet it is the des this meeting, that no restriction extend fu than by advice and counsel, not censure." donfield says, "The extract of last Yearly ing minutes concerning importing negroes, buying them after they are imported, being sidered by us, the sense of this meeting is, one ought to be restricted as well as the oth Shrewsbury says of the buying of negroes th is its sense, "that the practice is wrong; th fore desire that Friends may be restricted fo future."

The Yearly Meeting of this year strength by the reports from the Quarterly Meetings cided "that Friends ought to be very cautio making any such purchases for the future, i ing disagreeable to the sense of this meet And this meeting recommends it to the care o several Monthly Meetings, to see that such may be, or are likely to be found in that prac may be admonished and cautioned how they of therein." This had been done before Benja Lay came to America, and whatever effect his lent language had on the community in gen it manifestly had little other tendency that to tate many persons in the Society of Friends, ag whom it was aimed. After this minute of ad no person of religious standing in the Societ Friends, would be likely to purchase a slave, doing which would subject them to censure.

The ministers against whom Benjamin shooting his shafts, some of them held slaves, others had offended him by cautioning and proving him for his violent and eccentric att on those who had not then seen it proper to m mit theirs. He could not believe that any of t ministers could preach from a right author even though he found it very difficult to disc anything wrong in what they said. He say them, "And all this while preach, as their te Friends do; who cannot touch with that si practice to gain the whole world; profess the s pure truth, gospel, unction, annointing, urim thummim, measure of the spirit, pretend they h received the same manifestation and dispensa to preach as their innocent Friends, brethren sisters have. And really to give them their they come very near them in words, for wh and some others can see, for we have observed t strictly as is our duty upon Truth's account, w suffers so much by them, and their sinful pract as well as their oppressed and greatly afflic brethren and sisters. I say these nocents [g ty ones], come very near the innocents in wo except here and there, they do stretch and str rest, part, pervert, misconstrue, and misap scripture to serve their covetous ends, or to jus the practice, or to extenuate the crime."

Benjamin's violent language against those did not see exactly as he did, gave some colou reason to a remark, he tells us, Robert Jor made to him, "that he loved the negroes be than he did his Friends." He says, Robert told him that he had occasioned the death of wife, and he was a persecutor of the church. Robert said the first, it was merely in allusio the effect which his violence, and nervous exc bility had produced upon her. As to the however righteous his zeal against slavery mi be, he was in no wise justifiable in disturbing quiet of places of worship, and in intruding h self into meetings for discipline, when he k that he did not stand as a member in unity.

It appears from Benjamin Lay's statement t he opened in the Monthly, Quarterly and Yea Meeting, the state in which he was placed, demanded that the letter from Colchester conc ing him, should be read, and a letter or two wh

d himself received from some there. He that when he insisted on having the letters the meetings insisted that if read, he should leave the matter to the meetings to decide. did not satisfy him.

(To be continued.)

thing but an Insect.—A French naturalist several years in examining the structure single insect, and left the work unfinished. o body of an insect about an inch in length, er naturalist enumerated 306 plates compos- he structure of the outer envelope; 464 les for putting them in motion; 24 pairs rves, and 48 pairs of breathing organs. The er of lenses in the eye of a common fly is seven thousand: of the dragon fly, twelve and; of the butterfly, seventeen thousand. single wing of a butterfly have been found 00 scales. The house-fly's wing has a power 0 strokes in a second, which can propel it 35 while the speed of a race horse is but 90 feet nd. So thin are the wings of many insects 50,000 placed over each other would only be rter of an inch thick and yet thin as they are, is double.

Manufacture of Horn Combs.

t few of our readers are aware, perhaps, of mount of labour required to manufacture horn s, and the kind of material from which they rought. The butcher, after killing a steer, s the hide to the tanner or those who purchase im, and from them the comb maker obtains orns and hoofs, paying so much a hundred hem. In this city, Ed. Warner, G. G. Mil- Wm. Severns, Henry Rittenhouse and one or others are engaged quite extensively in business, and the following mode is adopt- make beautiful combs from crooked horns unsightly hoofs:—The horns, when taken e factory, have the tips sawed off, which tips old to the umbrella and cane manufacturers. e comb to be made is a back one, for children, orn is sawed spirally, by hand; if straight e, the horn is cut from end to end, after which are placed in cold water to soak, and after re- ing there for some time, are removed and ed with steel scrapers. The pressman then s them in hand, and after boiling them in water erm oil, places them in a press composed of iron s, heated with charcoal and when the horns attened, they are cut with shears into the pro- size for combs.

rom this room they go into the manufacturing rtment, and after being soaked again, are ed down to the proper thickness for twinning tting the teeth. The machine for cutting eeth is exceedingly ingenious and complicated. horn is placed upon a moderately heated bed r the tooth cutter, and at each pressing down e lever the piece of horn is cut into two combs. y are then taken out and pulled apart while m, and placed in the hands of the maker, who ls them or shapes the teeth, after which they o the finisher, who smooths them by rubbing surface with powdered brick, obtained from h, England.

fter being carefully washed, the stainer takes n in hand, and with a chemical preparation, s them according to his own fancy, which spots brought out after the comb has been placed in ye made of Nicaragua wood. The dye having most powerful effect on the part chemically pre- ed, the comb is made to assume somewhat the earance of tortoise shell. The combs are then ced in the sun, and after being thoroughly dried polished. The combs are not yet ready for sale, as they have to pass through the hands of the bender, who after heating them on an iron plate, ties them upon a block, fashioned into the shape desirable for the comb to assume. They are then placed into the hands of girls who give them the finishing touch by oiling and wiping them carefully, when they are passed to the hands of the packer, who puts them in packages for the market.

The sole of the hoof is cut out and manufactured into pocket and puff combs, and the upper part of the hoof, after going through the same process as the horn, is turned into combs of various kinds. The clippings from the horns, and hoofs are sold to the burners, who manufacture them into potash and Prussian blue.

Notwithstanding many of the combs are sold as low as eight cents per dozen each one has to pass through nine or ten distinct processes and new hands, each time, before they are ready for the market, and it is only owing to the rapidity with which they are made that any profit can be realized upon the manufacture.—*Ledger.*

For "The Friend."

Consequences of Slavery.

It is unpleasant to spread upon the pages of "The Friend," such tragic acts as a mother destroying her children under any circumstances. But the evidence which the following account gives of the natural love of liberty in the poor slave, the dread of a life of cruel vassalage and indignity, in which the man and woman of colour are held in our Southern states, lead us to believe that every event which may increase a horror for the dreadful system should be published on the house-top. We are shocked at the use of such means to release a child from future hopeless servitude, and altogether disapprove of the use of fire arms, either to procure or to defend liberty. Citizens of the free States who have no direct intercourse with slavery, should be frequently apprised of its debasing influence upon the master and his menial. The profits of dealing in slave produce, the desire to obtain southern help to secure a full proportion of the honours and gains of office in government, may blind the Northern man to the gross iniquity of slave-holding, and hence the need of constantly keeping the subject before his view.

"*A mother murdering her child rather than see it in Slavery.*—In the Cincinnati papers we find the full particulars of the arrest of the fugitive slaves.

"About ten o'clock on Sunday, a party of eight slaves, two men, two women, and four children, belonging to Archibald K. Gaines and John Marshall, of Richwood Station, Boone county, Kentucky, about 16 miles from Covington, escaped from their owners. Three of the party are father, mother and son, whose names are Simon, Mary and Robert, the others are Margaret, wife, of Robert, and her four children. The three first are the property of Marshall, and the others of Gaines. They took a sleigh and two horses belonging to — Marshall, and drove to the river bank, opposite the foot of Western Row, where they left them standing in the road, and crossed over to the city on the ice. They were missed a few hours after their flight, and — Gaines, springing on a horse, followed in pursuit. He proceeded to the office of U. S. Commissioner John L. Pendry, and, procuring the necessary warrants, with U. S. Deputy Marshal Ellis, and a large body of assistants, went at once to the place where his fugitives were concealed. It is as well here to state that Kite had been formerly owned in the neighbourhood of Richwood Station, and was purchased from bondage by his father. On reaching the house, Major Murphy, a neighbour of Gaines, and who was acquainted with Kite, called on him to open the door, and said that resistance would be useless. This Kite agreed he would do, but delayed so long that the officers attempted to force it open, when a window was suddenly thrown up, and one of the negro men, Robert, presented a pistol and fired. The ball wounded — Patterson, a resident of the Fourth ward, who had been deputised to assist in the arrest. A second party of officers came up, and the doors were forced open, and after a short but desperate resistance the slaves were secured, but not until Robert had fired three times, but without effect. After the conflict was over, a bloody and melancholy spectacle presented itself. One of the slave children was discovered lying on the floor with its head nearly severed from its body; two others, boys, aged about four or five years, were bleeding from wounds in the neck and head, and an infant in the arms of Margaret had its head much swollen, and was bleeding freely at the nose. The officers state that Simon and Mary, the eldest of the party, made no resistance, but that Margaret and Robert fought with the ferocity of tigers, and that during the affray she struck her infant son on the head with a fire-shovel, in the opinion of many, with the intention of taking its life.

"During a conversation with Margaret, she stated to us that she was eating breakfast in company with the other fugitives when she heard some one cry out, "They are coming, they are coming." They sprang up in alarm, but before they had time to fly, their captors burst in upon them. She fought with all the strength with which she was capable, and cannot tell how her child was killed and the others wounded, but only knows that the death and the wounding occurred during the affray. This is her story, but it is evident that the bloody tragedy was perpetrated while the officers were seeking admittance, and she is said to have acknowledged the fact of killing her child and wounding the others during the excitement incident to the arrest.

"The captives, as soon as arrested, were placed in express wagons, and driven to the office of the U. S. Marshal, on Fourth street, between Main and Walnut, followed by a large crowd of excited people. On reaching the Marshal's office, the wounds of the children were examined, when it was found that one of them had received a flesh wound on the neck, about three inches in length, but barely penetrating the skin—the other a scalp wound about the same length. They are but little hurt, and yesterday afternoon were playing about the Marshal's office, apparently unconcerned. On questioning the little fellows, they said that some one in the house threw them down and tried to kill them, but they either did not know, or would not reveal who it was. The slaves, on reaching the Marshal's office, seated themselves around the stove with dejected countenances, and preserved a moody silence, answering all questions propounded to them in monosyllables or refusing to answer them at all.

"The slaves were then taken down stairs to the street door, when a wild and excited scene presented itself—the sidewalks and the middle of the street were thronged with people, and a couple of coaches were at the door in order to convey the captives to the Station House. The slaves were guarded by a strong posse of officers, and as they made their appearance in the street, it was evident that there was a strong sympathy in their favour. When they were led to the carriage doors, there were loud cries of "drive on," "don't take them."

The slaves claim that they have all been on this side of the river frequently by the consent of their masters.—*Ledger.*

"*The Slave case at Cincinnati.*—On Fifth day last, United States Commissioner Pendry, at Cincinnati, ordered the fugitive slaves recently arrested there, to be brought before him that he might announce his decision. The Sheriff in whose custody they were, refused to deliver up the adults, he holding them upon the charge of murder. The Commissioner then adjourned his Court until Third day next. His decision is understood to be adverse to the claims of the slaves to their freedom. A habeas corpus has also been issued by the State Court to obtain possession of the slave children, held in custody by the United States Marshal. Writs have also been issued against the Sheriff to show cause why the adult slaves should not be returned to the custody of the United States Marshal. These writs were made returnable on Seventh day."

The last account states that the slaves were sent back to Kentucky under a strong guard—and that much excitement was created by it.

Another Escape of Slaves.—There seems to be a determination to make — Gaines, the citizen of Boone county, Ky., who claims four of the present party of fugitives, realize the fact that negroes can run away. We learn from good authority that four more of his slaves escaped from his plantation last night, and, as yet, their whereabouts has not been discovered. It is supposed, however, that they are still in Kentucky, under the protection of an agent of the U. G. R. R. In fact it is quite certain they have not yet crossed the river. The party consists of two women, a man and small child. Out of eleven slaves — Gaines has now but three, and, to judge from late events, there is no telling how long he can rely on their services. He is now, and has been for several days, in the city, attending to the present prosecution.—*Cin. Times.*

Family Affection.—It is an interesting fact, that the word *piety* among the old Romans, meant family affection, whether on the part of children or parents, or of brothers and sisters towards each other. And so the word seems to be used in the only case where it is used in the New Testament, 1 Tim. v. 4, where speaking of "children and nephews," the apostle, says "Let them learn first to show *piety* at home, and to requite their parents; for that is good and acceptable before God."

Wetting Bricks.—Very few people, or even builders, are aware of the advantage of wetting bricks before laying them; or if they are aware of it, they do not even think of practising it, for of the many houses now in progress in this city, there are very few in which wet brick are used. A wall twelve inches thick, built of good mortar, with bricks well soaked, is stronger in every respect than one sixteen inches thick, built dry. The reason of this is, that if the bricks are saturated with water, they will not abstract from the mortar the moisture which is necessary to its crystalization; and, on the contrary, they will unite chemically with the mortar, and become solid as a rock. On the other hand, if the bricks are put up dry, they immediately take all the moisture from the mortar, leaving it too dry to harden, and the consequence is, that when a building of this description is taken down or tumbles down of its own accord, the mortar from it is like so much sand.—*Scientific American.*

Forgiveness.—Two persons being very much at variance, referred their quarrel to a third person. Each accused the other, and both declared himself to be without blame. The umpire heard them very patiently, and then said, "My judgment is this: Let the innocent forgive the guilty."

For "The Friend."

Visitations of Divine Love.

One of the most important religious concerns to the church, is the training of the rising generation in the way of righteousness. While it is proper to indulge them in useful and healthful recreation, those who have overcome the snares and the natural propensities to evil, to which youth is incident, should watch over and restrain them as far as is in their power from everything that would lead into temptation, and strive to win them to the love of the Saviour and his religion. They may have strong wills often set towards worldly allurements, but their hearts are also capable of being softened by Divine love, and when they prove the unsatisfying nature of creaturely indulgence, and are brought under the convicting power of the Lord's spirit, they may be wrought upon to crave a better condition, and for strength to forsake everything that has separated them from the love of their heavenly Father.

Christopher Taylor kept a boarding-school at Waltham Abbey, in England, for Friends' children, which gained a good reputation in the Society. His instructions and religious influence combined with those of his wife and their assistants, appear to have been eminently blessed to the young people, under their care. In a narrative published by him in 1679, entitled "A testimony to the Lord's power and blessed appearance among children," he gives an account of an extraordinary visitation of heavenly love to the pupils in the school, from which the following, addressed to his brother, is extracted. He says, "Sitting towards evening with the family and children, in all about fifty, the Lord's sweet, tender, heart-breaking power, was with us in a shower of love, mercy and gentleness, which caused abundance of tears and great gladness; like to the love of a most tender father, in forgiveness and submission, especially to such who had been most stubborn; and the mild and gentle were under the sense of the same power, in pure love and sweet tenderness. The whole meeting was, I may truly say, so filled with divine comfort, that the heavenly flame drowned all sorrow at that time, and conquered all sense of terror and judgment, nothing but love and mercy appearing and overcoming all, that it was wonderful to behold the great gravity and sense of the children in the exercise. And now I may say that there is not one who hath been of the worst temper and disposition, but in pleading with them about their condition, hath been broken into a sensible acknowledgment with weeping eyes, so far hath the blessed power of the living God appeared in this place; a day much longed for, glory to the Lord forever: and certainly the living God will bestow more of his blessings upon us, by still pouring forth of his heavenly Spirit and of his glory, as we are tender before him.

So, dear brother, admire with us the excellency of God's pure love, and pray with us that we may all be kept in the sweet and humble acknowledgment of his most tender mercies. O that we may never give the least occasion, whereby the Lord may withdraw the sense of such great love and mercy from us. If I could tell thee, I would, how full of sweet melody my soul is at present, from the sense of his pure goodness, and how full of joy, and gladness and heavenly praises. O feel what my soul can admire, but what my tongue is unable to utter."

It is true that it is not in man's power to command such administrations of love, and of the heart tendering power of Truth, but were parents and others fervently concerned for the children's growth in grace, instead of neglecting their true interest, or wishing to render them acceptable to a proud and ostentatious world, they would fest their religious desires in a strict adher the humble life of a self-denying Christi structing them to mind the intimations of in their own hearts, and restraining them i fondness for show, and the company of tho are enemies to the cross of Christ. Altho is the Lord only who can give the blessin the increase to the prayers and the labours ligious parents, yet there are duties whicl owe to children, and which should comme quite an early period, that cannot be disre with impunity, but which, if faithfully disch release the parent from responsibility, and n blessed to the present and future happin their offspring. Young people have a meas the same Holy Spirit given to them to guide in the way of holiness, which visited the pa and for the neglect of which they will be ac able. No earthly gratification can counterb the loss of that peace given as the reward o dience. The applause and honours of a vain sink into nothing, before the honour that from God only, and which truly dignifies the ble follower of Christ, and qualifies him to f place in Christ's church on earth, and to b an inhabitant of the glorious city, which not the light of the sun or of the moon, to in it; for the glory of God doth lighten it the Lamb is the light thereof, and the nati them that are saved, do walk in the light th

When one of the days of those heavenly v tions may shine upon young people, we know But it would be the joy of the Lord's childr witness a general breaking forth of the day-s from on high, humbling the spirits of the young people, and bowing them to take the of their Redeemer upon them. Ann Dym describing the state of her mind at an early p of life, says, "My beloved parents were often cerned to advise and reprove me, and to giv good counsel; which, although to appearan had little or no effect at the time, has undoub been blessed to me; for which I now desire humbly thankful to the great Dispenser o good. His witness, placed in the secret o heart, even in those my very young years often striving with me, so that at seasons made sincerely desirous of altering my course as often the enemy prevailed by dissuading m can remember many a hard struggle in my te mind, even when I scarcely knew what it m Thus did my heavenly Parent condescend to me by the inshinings of his good Spirit, alth I knew him not. Oh, wonderful condescen indeed! My soul now bows in reverent grati for these his unmerited favours."

For a time she resisted these heavenly calls gave way to a levity of disposition, which opp her entering into that narrow path, which in m had been clearly opened to her view, as the one that led to peace. But it pleased the mighty still to follow her with his reproofs. T was a long and severe conflict between the co tions of Divine grace, and the strong propens of the natural will, yet it was joyfully evide some who felt an interest in her religious wel that the pure principle of light and life was dually rising into dominion in her soul. T she was prepared for the important work of ministry, her first appearance in which service about the twenty-fifth year of her age; and as time to time, she submitted to the humbling er of the cross of Christ, she became an able acceptable minister of the gospel. What an speakable blessing to her that she was finally vailed with to give up all and enter into the L vineyard, and labour in his cause. Her death

udden, in the prime of life, having two para-strokes in ten days, the last of which almost diately terminated her existence here below.

The Republic of Liberia.

the philanthropist and Christian this new n on the African coast is deeply interesting. nhabitants of Liberia are strictly a reli- people. Various American Missionary So- are endeavouring to disseminate truth and ousness among the inhabitants. The Me- t Episcopal church stands first in point of nd effort. Its Conference consists of twenty inisters, all of whom are coloured. They er 1301 members, of whom 116 are natives; nday schools with 839 scholars, of whom 50 tives; 20 week day schools with 513 scho- 7 native schools with 127 scholars: They erected a seminary building in Monrovia, at of $10,000, which is now affording instruc- o youth in the higher departments of science terature. The Baptist Missionary Conven- ns 15 churches with a native and colonist ership of 787,020 coloured missionaries, 7 rs, 4 native assistants, 13 day schools and upils. The (old school) Presbyterian Board sions have 2 ordained ministers, 3 churches, embers and 3 Sunday schools. They have l day schools for natives and colonists. A or one at Monrovia contains about 70 pupils, at the same place is the Alexander High l, a classical institution. The mission of the opal Church was commenced in 1836 at Cape s. It has now extended itself to the three nent sea-port towns of the Republic: Monro- assa, and Sinou. Among the colonists it has 4 l ministers, 4 common schools and 1 high , 5 teachers and 150 scholars. A large stone h is built at Cape Palmas, while a brick one hed at the flourishing station of Clay-Ash on the St. Paul's river. At Cape Palmas an orphan asylum. Heretofore the chief of this denomination has been directed to tive population. Among the Grebo tribe, ering 25,000, are 5 stations—whose lan- having been reduced to writing; the gospel ached to them. There are 15 native teachers, ained native ministers and about 100 native en in the boarding schools of the mission. societies are operating, but their success as as been limited. The experience of these ns confirms the growing conviction that if 0 millions of Africa are to be raised from gradation in which they are at present, this e mainly through influences resulting from put forth by its own sons and daughters, ave themselves been prepared for the pur- Little, directly, can be accomplished by from other lands; as most of those who attempted to labour, have fallen early mar- their zeal. Liberia, with its republican nment, there can be no question, is destined ert a benign impression on the rest of the ent. By its government and laws, its ls and churches, its trade and commerce, a influence will go forth from it which shall o raise Africa to a higher position among ations than she has for ages enjoyed. Thus ourse of progress and human elevation will be ded farther and farther into the interior, its itants raised from idolatry and superstition, s riches made available to the world.—*Led-*

vice.—Advice, says Coleridge, is like snow softer it falls the longer it dwells upon, and eeper it sinks into the mind.

Mary Capper to R. & E. C.

Warwick, First mo. 25th, 1828.

My kind friends,—On all occasions I witness your prompt exertions and affectionate desires to serve and gratify me. What shall I render for the continuation of mercies which I consider as flowing from a far purer source than any good in me. I wrestle in the spirit of prayer, that a thankful heart may crown every blessing so graciously bestowed. The details respecting our late endeared friend have been perused with no common feelings, the thoughts of my heart have been night and day occupied on the solemn subject. O! that ten thousand times ten thousand may be gathered to the standard of the Christian faith, the faith in which this, our highly favoured friend, lived and died; in the glorious hope of salvation through Christ Jesus who shed his blood for sinners! To see how a Christian can die is a privilege; but to die the death of a Christian, clothed with the light and life of our Mediator and Advocate with the Father, O how glorious!

Friend's Library.

The Largest Steamer Afloat.—The Persia, a new steamship, belonging to the Cunard line, is to leave Liverpool to-day, (the 26th,) for Boston. She is built of iron, by Napier & Sons, of Govan, on the Clyde, and as an effort has been made by her distinguished builders to excel any American steamship afloat, large anticipations of her speed are entertained. On her trial trip she ran two hundred and three miles in ten hours and forty three minutes, or nineteen miles an hour. She probably had a light draft at the time, but great speed is expected from her when coaled, freighted, &c. The Persia far exceeds in length, strength, tonnage, and steam power, the Great Britain or the Himalaya, exceeding also by twelve hundred tons the internal capacity of the largest of the present Cunard liners. Her length from figure-head to taffrail, is 390 feet; length in the water, 360 feet; breadth of hull, 45 feet; breadth over all, 71 feet; depth, 32 feet; burthen, 3,600 tons; diameter of paddle-wheels, 40 feet. According to the strict governmental (British) rule of admeasurement, her power is equal to that of nine hundred horses; according to the plan laid down in the Earl of Hardwicke's bill, her power is equal to that of twelve hundred horses; and according to Watt's old-established rule of 33,000 pounds to the horse, she is expected to work up to the pitch of between four and five thousand horses. "The weight of the iron in the Persia, when launched, was 2,200 tons. When the engines are on board, and fully loaded, the weight of the immense mass will be 5,400 tons, at which time she will draw twenty-three feet of water. Her coal cellars are constructed to receive 1400 tons of coal—an ample supply to carry her on her voyage across the Atlantic as fast as she can burn them. She has also accommodations for about twelve hundred tons measurement of goods."

This mighty fabric, so beautiful as a whole, is made up of innumerable pieces of ponderous metal, welded, jointed and riveted into each other. The framing of the ship is very heavy. The space between each frame is only ten inches, and the powerful frames are themselves ten inches deep, with double angle irons (knees) at the outer and inner edges. The bow is constructed in a manner at once peculiar, and affording the greatest possible strength to this important part of the ship. The framing is so placed to the stern, that the effect is that, in the case of collision with other ships, or with rocks or icebergs, the strain would fall upon the very strongest material within the structure, and the Persia would have a good chance of safety and successful resistance, while ordinary vessels would, indeed, be in great peril. She is not clinker-built, as some ships have been constructed of late. The plates, or outer planking of the ship, so to speak, are laid alternately, so that one adds strength to the other, and they form a whole of wonderful compactness and solidity. The keel-plates are 11-16ths of an inch in thickness; at the bottom of the ship, the plates 15-16ths of an inch in thickness; from this section to the load water line, they are ¾ of an inch, and above this they are 11-15ths of an inch in thickness. The plates round the gunwale are 7-8ths of an inch in thickness.

"The Persia has seven water-tight compartments. The goods are to be stowed in two of these divisions, each about 90 feet long, by 16 in breadth, and 20 feet in height. These goods-stores, or rather tanks, are placed in the centre line of the ship, with the coal cellars or bunkers on each side of them. At the same time, the vessel is so constructed, as to have, in reality, a double bottom under these goods-chambers, so that, if the outer were beat in or injured, the inner would, in all likelihood, protect the cargo dry and intact. The chambers are perfectly water-tight; and, in the event of accident to the hull, these tanks would of themselves float the ship. The liner has two engines and eight large tubular boilers and two funnels, and her machinery in general, first-class. The firing space for the boilers is placed in the fore-and-aft line, instead of across the ship, as is usually the case with smaller vessels."

Conversation.—He who sedulously listens, pointedly asks, calmly speaks, cooly answers, and ceases when he has no more to say to the point, evinces most common sense and promptness of character, and shows that he is fitted for business, and likely to succeed in it.

THE FRIEND.

THIRD MONTH 8, 1856.

There is an evident disposition on the part of some of the politicians among us, as well as with those in the government of Great Britain, to magnify the points of dispute existing between the two countries, and to inflame the passions of the people against each other; if not with the intent of urging them into actual warfare, at least to bring each into a threatening attitude, so as to claim credit for standing forward for the "honour" of their respective nation, and finally for extricating it from the dread alternative of war. This is a dangerous game. Judging of the causes for disagreement by the expositions given of them by those in authority on each side of the Atlantic, we are yet unwilling to believe that they can be regarded even by those citizens of either country who justify war, of such importance in themselves, or so linked with governmental policy, as to justify the two countries entering into deadly strife. Surely, in the present enlightened day, these United States and Great Britain can determine the meaning of a treaty, and adjust the requisite acknowledgments due for such a violation of municipal law or infringement of national sovereignty, as has been perpetrated in the enlistments complained of, without resorting to arms and seeking to destroy each other. Such a course would become only idiots or maniacs. We are glad to observe that some of the more moderate on both sides, are presenting this momentous subject in its true light, and using their influence to allay excitement, and prepare the way for a peaceful so-

lution of the questions. The last advices from England in reference to it are of a more pacific tone, and at Washington, several members, both of the Senate and the House, have expressed a confident belief that the whole matter can be readily settled by negociation. We trust that the force of public sentiment will be directed in such way, as will curb the unchristian efforts of those who are striving "to prepare the hearts of the people for war," and oblige the two governments to preserve unbroken their present position of amity and peace.

SUMMARY OF EVENTS.

EUROPE.—The steamship America brings Liverpool dates to Second mo. 16th. No tidings of the missing steamship Pacific had reached Liverpool when the America sailed, but some of the passengers report having seen a steamship on the 19th, when three days out from Liverpool, with a signal of distress flying, and apparently heading for the English Channel. This vessel may possibly have been the Pacific. The steamer Ericson arrived at Southampton on the 14th, having in tow the Dutch brig Anna Maria, which she found in distress, with a valuable cargo on board. It is announced that the Liverpool and Philadelphia line of steamers will resume their trips next month.

The Peace Congress.—The Conferences were expected to open on the 18th, but the non-arrival of Count Buol and Ali Pacha would probably postpone the meeting until the 21st ult. Lord Clarendon was to leave London on the 16th, for Paris. Ali Pacha had set out from Constantinople, and Count Buol was daily expected. The Russian Plenipotentiary had arrived at Paris. The London Advertiser says that Austria and France both desired that Prussia should be represented in the Congress, but Lord Palmerston absolutely insisted on her exclusion. The London Times has an editorial, which betrays anxiety as to England's success in the approaching negotiations. The Vienna correspondent of the Times asserts that there is an understanding between France and Austria, and that England will be outvoted in the Conference if she insists upon the disarming of the Eastern coast of the Black Sea.

The Crimea.—The Allies have exploded the last of the docks at Sebastopol. The Russians kept up a fire from the north side. Five English regiments were preparing to return to England. The French army received the peace news with much dissatisfaction. It caused considerable excitement in the Russian army, and the preparations which were being made for an attack on a division of the French, were discontinued, the orders being countermanded. Advices from Trebizond state that the Russians had evacuated part of Turkish Armenia, and had retired to Erivan.

SPAIN.—The Carlists are still active. Count Montmolens was negotiating a Carlist loan in Holland and Germany.

SARDINIA.—The Government needs more money, and the Senate has voted a loan of thirty millions.

AUSTRIA.—The conduct of the Italian Bishops in taking undue advantage of the Concordat, has given rise to new negotiations with the Pope.

GREAT BRITAIN.—The Chancellor of the Exchequer has notified capitalists to meet Lord Palmerston and himself on the 18th, to hear the proposed terms of a new loan, which it is supposed will amount to £20,000,000. Andrew Jackson & Son, corn merchants of Glasgow, have failed; liabilities, £70,000. A debate on American affairs occurred in the House of Commons on the 15th ult. Roebuck contended that under the circumstances the government of the United States was justified in requiring the recall of the British Minister, and that the apology which the British government had tendered, was a delusion upon the House and the country. *The Cotton Market.*—Sales of the week, 92,000 bales at an advance, ranging from ½ to ¼*d*. The flour market was dull with a decline of 6*d*. Corn also had declined. The London money market was very stringent. Consols had declined to 90¾ a 90¾.

MEXICO.—The latest accounts from this distracted country, represent the revolutionists who wish to establish an *empire*, as making progress. They have possession of Puebla. The Fortress of San Juan declared in their favour, but afterwards surrendered.

UNITED STATES.—*Nomination for the Presidency.*—The American National Convention, recently in session in Philadelphia, nominated Millard Fillmore, of New York, for the office of President, and Andrew J. Donelson, of Tennessee, for Vice President of the U. States.

The Dispute with England.—The President has communicated to Congress the documents and correspondence between this country and Great Britain, with reference to the violation of our neutrality laws by British agents, showing the British Government manifestly in the wrong. The American Minister in England is said to have declared his opinion that all the matters in dispute would soon be amicably adjusted.

Congress.—The Committee on Territories has reported to the House of Representatives a bill authorizing the people of Oregon to form a State government, preparatory to admission into the Union. Another bill has been reported from the same committee annulling the acts of the Legislative Assembly of Kansas, which require certain oaths, including one to support the fugitive slave law, to be taken by the public officers of that territory. The House has appointed a special committee in relation to the railroad between the Atlantic and Pacific. The Senate has passed a bill to authorize the Secretary of the Treasury to permit the owner of any vessel to change the name of the same, on the presentation of sufficient reasons. The discussion of the Central American question, and the difficulty with England, has occupied much time in this body.

California.—The steamship Illinois arrived at New York on the 27th ult., from Aspinwall, with the California mails of Second mo. 5th, 283 passengers and $1,140,208 in gold. Much rain had fallen in California, and the agricultural prospects were favourable. The Legislature was so divided as to be unable to elect a U. S. Senator. Sanders and Hammond, both formerly collectors at San Francisco, have been indicted for embezzling the funds. No fighting had taken place in Oregon since the sailing of the last steamer. The Limotour claim has been confirmed by the United States Land Commission. The claim covers 15,000 acres of land in and near San Francisco, estimated to be worth six millions. It will be carried to the Supreme Court. The steamer Belle had exploded her boilers near Sacramento, killing thirty persons, and totally destroying the boat.

New York.—The assessed valuation of real and personal property in this city, amounts to over five hundred and twenty-nine millions of dollars. The real estate market is said to be active, and prices very high. The steamer Atlantic sailed on the 1st for Liverpool. Among her passengers was G. M. Dallas, the newly appointed Minister to England. He was accompanied by his family.

Philadelphia.—Mortality last week, 212, of which from small-pox, 14; scarlet fever, 16. On the 1st inst., a channel through the ice was opened, and many vessels were released from their long detention.

Miscellaneous.—The Missing Steamer.—The Pacific is insured for $600,000, half in this country, and half in Europe; the freight money is insured for $40,000 more. Her cargo was valued at more than $1,500,000, most of which was insured, a great part in the United States.

The Western Rivers.—The ice broke up at St. Louis on the 28th ult., sinking two steamboats, and damaging many. On the 29th, the navigation of the Ohio had been resumed from Cincinnati down; the river seemed to be about breaking up at Wheeling and above.

The Fugitive Slaves at Cincinnati.—It was finally decided in this case, that the fugitives should be given up to the U. S. marshal, and by him returned to their owners. They were conveyed across the river, without disturbance or opposition.

Prohibition.—The Committee of the New York Assembly to whom the subject was referred, has reported a bill to repeal the Prohibitory Law of last session.

Imprisonment for Debt.—A man, named Dupre, died in the Queen's Bench prison, London, on the 6th ult., after an incarceration of *forty-four years* for debt.

The Annual Production of Crude Iron, throughout the world, is estimated at 6,000,000 tons. Of this Great Britain produces 3,000,000, France 750,000, Prussia 300,000, Austria 250,000, Belgium 200,000, Russia 200,000, Sweden 150,000, the lesser German States 100,000, the United States 750,000, and other countries 300,000.

The Width of the Delaware, opposite Marcus Hook, Pa., was accurately measured, a few days ago, by a civil engineer, and found to be, from bank to bank, two miles, less one hundred and four yards. At Chester, it is only one mile and a quarter wide.

The Width of the Mississippi, at St. Louis, Mo., is 1900 feet at the narrowest point. The deepest water is 60 feet.

Senator from Ohio.—The Legislature of this State has elected B. F. Wade U. S. Senator for six years, from Third mo. 4th, 1856.

Shipwreck.—The ship Great Duke, of Boston, from New Orleans, for Liverpool, was wrecked on the 6th ult. The captain and twenty-nine men were drowned.

A Slaver Destroyed.—The brig Chatsworth, of New York, was chased by the British ship of war Hecate the 1st of the present year. She was run ashore on African coast, and deserted by her crew, and afterwa destroyed by her captors.

Population of St. Louis.—According to a census taken, the population is 121,829; in 1850, it was 860.

WEST-TOWN BOARDING-SCHOOL.

The Winter Session of the School will close on 11th of Fourth month, and *not on the 4th, as was o neously stated in the late notice.*

The Summer Session will commence on Second-d the 12th of Fifth month.

Application for admission must be made to Jos Snowdon, Superintendent at the school, or to Jos Scattergood, Treasurer, No. 84 Arch street, Philad phia.

West-town, Third mo. 3d, 1856.

"A concise account of the Religious Society of Frie commonly called Quakers, embracing a sketch of th christian doctrines and practices."—pp. 136.

This little book is designed to present to inquir both within and without the pale of the Society, a e densed view of the principles and testimonies of Frie It contains a sketch of the rise, organization and cipline of the Society, of its belief in the fundame doctrines of Christianity, its views on worship, mi try, prayer, war, oaths, public fasts, slavery, trade business, simplicity of apparel, the plain language disuse of compliments, names of the months and day the week, moderation and plainness in living, amu ments, reading and music.

It is for sale at Friends' Bookstore, 84 Arch st and Uriah Hunt & Sons, No. 44 N. Fourth street.

For "The Friend."

Martha and Mary.

(Concluded from page 202.)

hen the news came to Mary of the committal r friends to jail, the distress of her mind ex- ed itself in a burst of uncontrollable indigna- and then, asking counsel of no one, she r on her hat and cloak, and taking with her d man who lived in the family as a labourer, urried to the justice's; and as she did not r with any mark of the despised Quaker, r in dress or manner, she soon obtained ad- nce. The magistrate was somewhat startled e sudden apparition of so fair and young a en, and demanded her pleasure with unwont- urtesy, seating her in the chair beside him, removing from his head the laced hat which as wearing at her entrance. Mary made her nd for the liberation of her friends, the Qua-

The justice stared, as if doubting his senses, allied her on the strangeness of her request, ging upon the Quakers, all those absurd and trous things which were alleged against them ose days. Mary, nothing abashed, denied charge as false, and demanded, if not the ation of her friends, at least the amelioration eir sufferings. As Mary pleaded, the justice angry, and at length the full violence of his er broke forth, and the high-spirited girl, more indignant than terrified, rushed from resence.

hat was next to be done? She ordered her ttendant to saddle the horses, and mounting and bidding him follow on the other, she set the county town. There she found great bers of Friends surrounding the prison with ets of provisions, bedding, warm clothing, fuel, begging for admittance to their perish- brethren. Little children, too, there were, ing for their imprisoned parents, and offering little all to the jailer, so that they might be itted to share their captivity. Mary made way through this melancholy crowd, peremp- y demanded access to the jailer, and was ad- ed; her garb, unlike that of the persecuted kers, obtaining for her this favour, as at the e of the justice. But here again her errand rred her further success; the jailer would her allow her to see her friends, nor would he ey a message to them. Mary could have wept nger and vexation, and from intense sympathy the grief she had witnessed outside the walls, she did not; she retorted upon the jailer the rity of his manner, and bidding him look to consequences, folded her cloak round her, and walked forth again into the circle of Friends who surrounded the gate. The jailer laughed as he drew the heavy bolts after her, and bade her do her worst.

Among the Friends collected in the street before the prison, Mary heard that William Penn, who had just returned from his new settlement in America, was now in London. As soon as she heard this, she determined upon her plan of conduct. She knew his influence with the king, who, when Duke of York, had induced his brother, Charles II., to bestow on him that tract of land, called Pennsylvania. To him, therefore, she determined to go, and pray him to represent to the king the deplorable sufferings of Friends in those parts.

When her old attendant heard of her meditated journey, he looked upon her as almost insane. To him the project was appalling. It would require many days to reach London, and who must take charge of the farm in his absence, seeing his worthy master was in prison? And then, too, though he had been willing to attend her as far as the next town, would it be right for a young maiden and an old man to endanger their lives by so long and so strange a journey?

Mary was uninfluenced by his reasoning, nor was she to be daunted by his fears. "If," she said, "he would not accompany her, she would go alone." She bade him, therefore, to have her horse saddled by break of day, and retired to her own apartment, to prepare for the journey.

"Of a surety," said the old man to himself, "she is a wilful young thing."

In the morning, however, she found not only her horse prepared, but the old man and his also; for, wilful as she was, the old man loved her; and though he could not conjecture the object of so strange a journey, "he would," he said, "go with her to the end of the world."

Mary had ventured to make use of the stores in Walter Pixley's coffers, for she considered the lives of her friends were at stake. She was therefore sufficiently supplied with money for their journey.

For this time the wild gaiety of Mary's spirits was gone, but instead, was a strong energy and determination of character, which supported her above fatigue, or the apprehension of danger; and day after day, from town to town, in the depth of winter, did she and her attendant journey onward They had no intercourse with travellers on the road, nor did they make known to any one the object of their journey.

When she arrived in London, she went straight to the house where William Penn had his temporary residence, and without introduction, apology, or circumlocution, laid before that great and good man the sad condition of her suffering friends. She then made him acquainted with her own private history, her obligations to the family of the worthy Walter Pixley, and the anxiety she now felt for the life of her who had been as a mother unto her.

William Penn heard her with evident emotion, and promised to do all that lay in his power for her benefactors; though he assured her she had overrated his influence with the king. He then desired Mary to take up her abode under his roof; and bidding an attendant call in his mistress, he gave her into the hands of his fair and gentle wife, briefly relating to her upon what errand the young maiden had come.

When Mary found her mission thus far so happily accomplished, and the door shut upon herself and her kind hostess, the overstrained energy of her spirit for a moment relaxed, and she wept like a feeble child. The fair wife of William Penn understood her feelings, soothed her with sympathy, and encouraged her to open her heart freely. Never had Mary seen goodness so graceful and attractive as in the high-minded and gentle being before her. Her very soul blessed her as she spoke; she could not doubt but that all would be well; and with her heart comforted, assured, and filled with gratitude, it seemed as if a new life had been given to her.

The next day William Penn obtained an audience of the king, and so wrought upon him by the story of the heroic young creature under his roof, and the sufferings of her friends, that he desired she might be brought before him, and receive from his own hands the order for their enlargement.

Mary was accordingly arrayed in the best garments her scanty wardrobe permitted, by the elegant and gentle hands of Gulielma Penn, who surveyed her beautiful face and figure with admiration, and then kissed her and blessed her, as an affectionate mother might bless a beloved daughter.

Leaning upon the arm of her protector, she was conducted through a great chamber of lords and ladies, assembled for the occasion, into the presence of his majesty. Mary's heart beat violently, and her companion, drawing her arm from his, presented her to his sovereign, who graciously bade her speak her wishes without fear. Reassured by the kindness of the king's manner, almost forgetting the presence in which she stood, for what seemed to her the greater importance of her errand, she made her petition gracefully and well. She related all she had told William Penn of the great kindness of the Pixleys to her, and her otherwise desolate condition; she told of their domestic virtues, of their piety, and their firm loyalty; and, lastly, of their wretched condition in the jail, with that of many others; and of the cruelty of the justice and the jailer: and then, almost unconsciously falling on her knees, she prayed so eloquently that they might be released, that the king turned aside to wipe away a tear before he put forth his hand to raise her.

The petition was granted. The king himself put into her hands the order for their release, and then praying God might bless her, and taking leave of William Penn very kindly, passed out of the presence-chamber. Many of the lords accompanied the king, but the rest closing around the almost terrified maiden, overwhelmed her with compliments. William Penn, who saw her confusion, apologised for her with all the grace of a courtier, and extricating her from the admiring company, conveyed her, like a being walking in a dream, to his own house.

Not a moment was lost in sending down by express the order for the Friends' enlargement, and together with that, a dismissal from his office for

the jailer. Rest was now absolutely necessary for Mary after these extraordinary exertions; William Penn detained her, therefore, a few days under his roof, and then conveyed her himself in his own comfortable carriage to the house of her friends. It is impossible to describe the joy which her return afforded, and which was not a little increased by the presence of her illustrious companion.

The troubles and persecutions of the Pixleys here came to an end, for they went over to Pennsylvania with its distinguished founder, on his return, and became noted among the most worthy and influential of the settlers there. Mary, however, returned to England, being affluently married; and I myself, several years ago, was possessed of a piece of needlework said to have been of her doing.

For "The Friend."

Ocean Routes and Ocean Races.

"O, 'Tis a thought sublime, that man—
Himself so mean 'mid things so vast—can force
A path upon the waste, can find a way
Where all is trackless, and compel the winds
To lend their untam'd wings, and bear him on
To distant climes."

The grand object of the researches connected with the Wind and Current Charts, is, as was explained in our last, the improvement of navigation, reducing both the time and the danger of oceanic passages. By patiently and laboriously sifting the numerous sea-journals sent to the National Observatory, Lieut. Maury has ascertained the set of the currents and the prevailing winds for a great part of the ocean. It is these that control the mariner in his course, and to know how to make the most of them, is the perfection of navigation. This is evidently no easy thing to accomplish, and it is rendered still more complex than at first sight might appear, by the fact that the regions of the different prevailing winds, the calm belts that stretch across the ocean several hundred miles wide, and the currents of the sea, do all change their position more or less with the different seasons of the year. When therefore a vessel sets sail for a distant port, her captain—furnished with the "Wind and Current Charts," and with the latest edition of the accompanying "*Sailing Directions*"—has this interesting problem to solve. What route shall I pursue in order to encounter the most favourable winds, to be the least baffled by calms, and be drifted as little as possible from my course by currents? The "*Sailing Directions*" point out the general course of the principal routes, but much depends on the skill of the navigator in carrying out these directions, and applying them to the peculiar circumstances in which his vessel may be placed.

"When one looks seaward from the shore," says Maury, "and sees a ship disappear in the horizon on a voyage to India, or the Antipodes, perhaps, the chances of another ship, sailing with the same destination the next day, or the next week, coming up and speaking with her on the 'pathless ocean,' would, to most minds, seem slender indeed. Yet the truth is, the winds and the currents are now becoming so well understood, that the navigator, like the backwoodsman in the wilderness, is enabled literally 'to blaze his way' across the ocean; not, indeed, upon trees, as in the wilderness, but upon the wings of the wind. The results of scientific inquiry have so taught him how to use these invisible couriers, that they, with the calm belts of the air, serve as sign boards to indicate to him the turnings, and forks, and crossings by the way.

"Let a ship sail from New York to California, and the next week let a faster one follow after: they will cross each other's path many times, and are almost sure to see each other by the way." As an illustration of this, our author mentions the case of the "Archer" and the "Flying Cloud," on their voyage to California some two years since. They were both fine clipper ships, and were ably commanded. The "Archer" left New York nine days in advance of the other, and following the new route indicated by the charts, crossed the calms of Cancer, and the dashed along through the north-east trades to the equator. "The 'Cloud' followed after, crossing the equator upon the trail of Thomas, of the 'Archer.' Off Cape Horn she came up with him, spoke him, handed him the latest New York dates, and invited him to dine on board of the 'Cloud,' which invitation, says he of the 'Archer,' 'I was reluctantly compelled to decline.'

"The 'Flying Cloud' finally ranged ahead, made her adieus, and disappeared among the clouds that lowered upon the western horizon. She reached her port a week or more in advance of her Cape consort. Though sighting no land from Cape Horn Horn until they gained the offing of San Francisco—some eight thousand miles—the tracks of the two vessels were so nearly the same, that being projected on a chart they would appear almost as one."

The route from the Atlantic States to California, is the great race course of the ocean: it is fifteen thousand miles in length. "Here the modern clipper ship has been sent, guided by the lights of science, to contend with the elements, to outstrip steam, and astonish the world." The trials of speed on this course do not involve the overtasking of the strength and endurance of man or beast; there is no heating of steam-boilers to the verge of explosion; no idle, or worse than idle, multitudes are drawn from their business and their duties to witness the exciting scene; and last not least, we trust no wagers are staked on the result, or if they are in any cases, it is not as an incentive to the contest. A remarkably quick passage performed by a clipper ship, gains her a reputation that enables her to command for future voyages higher rates of freight than her slower rivals. This, then, is the great stimulus to the competition for speed on the routes to California, to Australia and the East Indies. Whenever, therefore, one of these fast ships sets sail on any of these routes, it is the aim of her captain and owners that she shall make at least a quick passage, and if practicable, the quickest on record. But when three or four first-class clippers sail within a few weeks of each other for the same distant port, the competition becomes more interesting and exciting, as in the following instance related in the "Physical Geography of the Sea."

"It was in the autumn of 1852, when navigators were beginning fully to reap the benefits of the researches with regard to the winds and currents, and other facts connected therewith, that four splendid new clipper ships put to sea, from New York, bound for California. They were ably commanded, and, as they passed the bar at Sandy Hook, one by one, and at various intervals of time, they presented really a most magnificent spectacle. Like steeds that know their riders, they were handled with the most exquisite skill and judgment, and in such hands they bounded out, upon the 'glad waters' most gracefully. Each being put upon her mettle from the start, was driven under the seaman's whip and spur, at full speed over a course that would take them three long months to run."

The names of these ships and their masters, and the dates of their departure from New York, were as follows:

The Wild Pigeon, Capt. Putnam, sailed T
month 12th.

The John Gilpin, Capt. Doane, sailed T
month 29th.

The Flying Fish, Capt. Nickels, sailed Ele
month 1st.

The Trade Wind, Capt. Webber, sailed
venth month 14th.

"It was the season for the best passages.
one was provided with the *Wind and Cu
Charts*. Each one had evidently studied
attentively; and each one was resolved to
the most of them and do his best.

"Wild Pigeon led the other two out of
York, the one by seventeen, the other by tw
days. But the winds seem to have been ag
her from the start. As soon as she had taker
departure, she fell into a streak of baffling w
and then into a gale, which she contended
for a week, making but little progress. She
had a time of it in crossing the horse latitu
By this term, it should be premised, sailors
those regions of the ocean lying near the trop
Cancer, where they are almost certain to en
ter calms or very light winds. A similar b
calms extends across the ocean near the trop
Capricorn, and another near the equator, th
mostly a few degrees north of it. This lat
known as the "Doldrums." Between the
belt of Cancer and the "Doldrums," is the re
of the *north-east trades*, where the winds blo
most continually towards the south-west. S
of the "Doldrums," and extending to the
belt of Capricorn, is the region of the *s
east trades*. The position of these calm belts
trade wind regions, changes with the seaso
the year, moving towards the north during
summer, and towards the south during the wi
so that they are the furthest north in autumn,
the furthest south in spring.

The Wild Pigeon was nineteen days in reac
the parallel of 26° north, having logged thi
of them as days of calms and baffling w
"Thence she had a fine run to the equator,
ing it between 33° and 34° west longitude
thirty-second day out. She was unavoidably fo
to cross it so far west, for only two days b
she crossed the parallel of 5° north in 30°
excellent position." The longitude of Cape
Roque is about 35° west, latitude 4½° south,
the set of both winds and currents there, is
ally towards the west or north-west. Hence,
sels crossing the equator further west than 3
31 degrees, are liable to be carried too far
ward to clear the Cape. The old rule was, n
cross the line west of 23°, but Maury's resear
have shown that a detour so far to the east, i
tirely unnecessary, and involves a great lo
time.

In three days after crossing the line, the Pi
cleared Cape St. Roque, which shows that
made the best of her untoward westward posi

"So far," says Maury, "chances had turne
against the Pigeon, in spite of the skill displ
by Putnam as a navigator; for the Gilpin and
Fish came booming along, not under better
agement, indeed, but with fairer courses b
them. In this stretch they gained upon h
the Gilpin seven, and the Fish ten days,"
clearing St. Roque on the same day, and but
days after the Pigeon had cleared it.

"Evidently the Fish was most confident
she had the heels of her competitors; she felt
strength from the start, and was proud of it.
dashed down southwardly from Sandy Hook,
ing occasionally at the charts; but, feeling st
in her sweep of wing, and trusting confident
the judgment of her master, she kept, on

nge, two hundred miles to leeward of the right
k. Rejoicing in her many noble and fine qua-
s, she crowded on her canvass to its utmost
tch, trusting quite as much to her heels as to
charts, and performed the extraordinary feat
rossing, the sixteenth day out from New York,
parallel of 5° north. The next day she was
south of 4° north, and in the Doldrums, lon-
de 34° west.

Now her heels became paralyzed, for Fortune
as to have deserted her awhile—at least her
er, as the winds failed him, feared so; they
him his motive power, they were fickle, and
as helplessly baffled by them. The bugbear
north-west current off Cape St. Roque, began
om up in his imagination, and to look alarm-
then the dread of falling to the leeward
e upon him: chances seemed to conspire
ist him, and the mere possibility of finding
fine ship back-strapped filled the mind of
els with evil forebodings, and shook his faith
s guide. He doubted the Charts, and com-
ed *the* mistake of the passage.

The *Sailing Directions* had cautioned the
gator, again and again, not to attempt to fan
g to the eastward in the equatorial Doldrums,
by so doing, he would himself engage in a
less strife with baffling airs, sometimes re-
ced in their weakness by westerly currents.
the wind had failed, and so too, the smart
ain of the Flying Fish evidently thought, had
Sailing Directions. They advise the naviga-
in all such cases, to dash right across this
streak, stand boldly on, take advantage of
s in the wind, and, by this device, make east-
nough to clear the land. So, forgetting that
Charts are founded on the experience of great
bers who had gone before him, Nickels being
ted, turned a deaf ear to the caution, and
away three whole days and more, of most
ous time, dallying in the Doldrums. He
t four days about the parallel of 3° north, and
hip left the Doldrums after this waste of time,
ly upon the same meridian at which she en-
l them.

She was still in longitude 34°, the current
ing her back just as fast as she could fan east.
r so great a loss, her very clever master, doubt-
his own judgment, became sensible of his
. Leaving the spell-bound calms behind him,
e he had undergone such trials, he wrote in his
as follows: 'I now regret that, after making
ne a run to 5° north, I did not dash on, and
k my way to windward to the northward of
Roque, as I have experienced little or no wes-
set since passing the equator, while three or
days have been lost in working to the east-
l, between the latitude of 5° and 3° north,
nst a strong westerly set;' and he might have
d, 'with little or no wind.' In three days
this, he was clear of St. Roque. Just five
before him, the barque 'Hazard,' bound for
had passed exactly in the same place, and
ed two days on the Fish, by cutting straight
ss the Doldrums, as the *Sailing Directions*
sed him to do.

But notwithstanding this loss of three days
he Fish, who so regretted it, and who after-
ls so handsomely retrieved it," she was, on the
of Eleventh month, as far south as the Gil-
her competitor, who had left New York three
before her. "They were then both in the
llel of 5° south, the Gilpin being thirty-seven
s to the eastward, and of course in a better
tion, for the Fish had yet to take advantage
lants, and stand off shore to clear the land.
y had not seen each other.

The Charts showed the Gilpin now to be in the best position, and the subsequent events proved the Charts to be right; for thence to 53° south, the Gilpin gained on the Pigeon two days, and the Pigeon on the Fish one." The Fish, therefore, was now again three days behind the Gilpin—the same as when she left New York; but by dashing through the Straits of Le Maire, she regained these three days, and the two vessels arrived off Cape Horn together. The Pigeon had reached this turning point ten days before them, but the treacherous winds again deserting her, she had spent all this time contending with calms and western gales, and making but little progress, while her more favoured pursuers "were coming up with fine winds and flowing sheets. They finally overtook her, bringing along with them propitious gales, when all three swept past the Cape," and turned their course northward. The Fish and Pigeon crossed the parallel of 51° south, on the other side of "The Horn," both on the same day, the Gilpin one day later. The Fish was the furthest east.

"The Pigeon was now, according to the Charts, in the best position, the Gilpin next, and the Fish last; but all were doing well.

"From this parallel to the south-east trades of the Pacific, the prevailing winds are from the north-west. The position of the Fish, therefore, did not seem as good as the others, because she had not sufficient sea-room in case of an obstinate north-west gale."

But the winds favoured her. On the 30th of Twelfth month, "the three ships crossed the parallel of 35° south, the Fish recognizing the Pigeon, while the Pigeon saw only a 'clipper ship,' for she could not conceive how the ship in sight could possibly be the Flying Fish, as that vessel was not to leave New York for some three weeks after she did. The Gilpin was only thirty or forty miles off at the same time.

"The race was now wing and wing. With fair winds and an open sea, the competitors had now a clear stretch to the equator of two thousand five hundred miles." The Flying Fish led the way, but the Wild Pigeon pressed hard after her. They both reached the equator on the 13th of First month, "the Fish leading just twenty-five miles in latitude, and crossing in 112° 17' west longitude; the Pigeon, forty miles farther to the east. At this time the John Gilpin had dropped two hundred and sixty miles astern, and had sagged off several degrees to the westward.

"Here Putnam, of the Pigeon, again displayed his tact as a navigator, and again the fickle winds deceived him: the belt of north-east trades had yet to be passed. By crossing where she did, she would have an opportunity of making a fair wind of them, without being much to the west of her port when she should lose them. Moreover, it was exactly one year since she had passed this way before; she then crossed in 109°, and had a capital run thence of seventeen days to San Francisco.

"Why should she not cross here again? She saw that the 4th edition of *Sailing Directions*, which she had on board, did not discountenance it, and her own experience approved it. Could she have imagined that in consequence of this difference of forty miles in the crossing of the equator, and of the two hours' time behind her competitor, she would fall into a streak of wind, which would enable the Fish to lead her into port one whole week?

"But by this time, 'John Gilpin' had got his mettle up again. He crossed the line in 116°—exactly two days after the other two—and made a glorious run of fifteen days thence to the pilot grounds of San Francisco." The Trade Wind crossed the line in 112°, twenty-three days after the Gilpin—having been just one week longer on the passage thus far. She had a good run thence of sixteen days to San Francisco.

"The 'Flying Fish' beat: she made the passage in 92 days and 4 hours from port to anchor; the Gilpin, in 93 days and 20 hours from port to pilot; the Wild Pigeon was 118 days. The Trade Wind followed, with 102 days, having taken fire, and burned for eight hours on the way.

"The result of this race may be taken as an illustration as to how well navigators are now brought to understand the winds and currents of the sea. Here are three ships sailing on different days, bound over a trackless waste of ocean for some fifteen thousand miles or more, and depending alone on the fickle winds of heaven, as they are called, to waft them along; yet, like travellers on the land, bound upon the same journey, they pass and repass, fall in with and recognize each other by the way; and what perhaps is still more remarkable, is the fact that these ships should each, throughout that great distance, and under the wonderful vicissitudes of climates, winds and currents which they encountered, have been so skilfully navigated, that, in looking back at their management, now that what is past is before me, I do not find a single occasion, except the one already mentioned, on which they could have been better handled."

LLN.

Children.—It is a mistake to think that children love the parents less who maintain a proper authority over them. On the contrary, they respect them more. It is a cruel and unnatural selfishness that indulges children in a foolish and hurtful way. Parents are guides and counsellors to their children. As a guide in a foreign land, they undertake to pilot them safely through the shoals and quicksands of inexperience. If the guide allows his followers all the liberty they please; if, because they dislike the constraint of the narrow path of safety, he allows them to stray into holes and precipices that destroy them, to slake their thirst in brooks that poison them, to loiter in woods full of wild beasts or deadly herbs, can he be called a sure guide?

And is it not the same with our children? They are as yet only in the preface, or as it were, in the first chapter of the book of life. We have nearly finished it, or are far advanced. We must open the pages for these younger minds. If children see that their parents act from principle—that they do not find fault without reason—that they do not punish because personal offence is given, but because the thing in itself is wrong—if they see that while they are resolutely but affectionately refused what is not good for them, there is a willingness to oblige them in all innocent matters—they will soon appreciate such conduct.

If no attention is paid to the rational wishes—if no allowance is made for youthful spirits—if they are dealt with in a hard and unsympathising manner—the proud spirit will rebel, and the meek spirit be broken. Our stooping to amuse them, our condescending to make ourselves one in their plays and pleasures at suitable times, will lead them to know that it is not because we will not, but because we cannot attend to them, that at other times we refuse to do so. A pert or improper way of speaking ought never to be allowed. Clever children are very apt to be pert, and, if too much admired for it, and laughed at, become eccentric and disagreeable.

It is often very difficult to check our own amusements, but their future welfare should be regarded more than our present entertainment. It should never be forgotten that they are tender plants com-

mitted to our fostering care—that every thoughtless word or careless neglect may destroy a germ of immortality—"that foolishness is bound up in the heart of a child"—and that we must ever, like watchful husbandmen, be on our guard against it.

It is indeed little we can do in our strength, but if we are conscientious performers of our part—if we earnestly commend them in faith and prayer to the fostering care of their Father in Heaven—to the tender love of Him, the Angel of whose presence goes before them, and who carries these lambs in his bosom—we may then go on our way rejoicing—for "He will never leave nor forsake those who trust in Him."

For "The Friend."

Early Anti-Slavery Advocates.

BENJAMIN LAY.

(Continued from page 205.)

The following is written in a gentler strain than usual for him:—"Ninth month, 1736, as I sat in Concord meeting-house, it was their Quarterly Meeting; I may say it was a sweet and comfortable time to me; it came into and arose in my mind in the love of Truth, that if our slavekeepers had been, or now would be faithful to God, and would bring up their negroes to some learning, reading, and writing, and endeavour to the utmost of their power in the sweet love of Truth, to instruct and teach them the principles of Truth and righteousness, and learn them some honest trade or employment, and then set them free; and all the time they are teaching them, let them know that they intend to let them go free in a very reasonable time, and that our religious principle will not allow of such severity, as to keep them in everlasting bondage and slavery; this might beget such love and tenderness in them toward their masters or mistresses, and to the blessed Truth, for their sakes, that it might be a means to convince some of them. And should they come to receive the pure Truth, in the love of it; as, blessed be the Lord, many of us have, and in that sweet love, which is constraining, come under a concern and necessity, to go and visit their brethren of their own colour, and country, and language, and preach the gospel of eternal salvation unto them, from sin and captivity, both of body and soul, this would be a glorious work, indeed, and well worth our Friends' pains, charge and time, that they might spend about it; and the best compensation to God and man, as I think, that they can possibly make, for being so long in a practice that has so much wickedness attending of it continually."

On the 27th of Ninth month, 1736, he comments on these words of the beloved disciple:—"If you walk in the light as he is in the light, ye shall have fellowship one with another, and the blood of Jesus Christ shall cleanse you from all sin." After speaking of those who "are clean, being cleansed by the light, by the life of the Lamb, who follow him through many tribulations," he says, "These—these blessed ones, have a right to the tree of life, to the pure river of life, to eat and drink as much as their vessels can hold at times, and sometimes it is running over and flowing out to them that are in the outward court, that is trodden by the Gentiles in this our age, if happily they might be entreated and prevailed with, if possible, by tasting some drops as it were without, to turn into their own souls, and wait there to be cleansed, that the fruition, the pure river, clear as crystal, might run there freely and sweetly, without interruption. If the little touches, the earnest of this heavenly river be so sweet and precious, as to be sure it is, beyond all worldly things; what must the ever-flowing fountain be, which springs continually in holy souls in eternal life? O, let the inhabitants of the tree, the river, the rock, sing aloud for joy, from henceforth forevermore; so be it! Glory, glory, endless to the All in all, saith my soul at times."

The eccentric actions of Benjamin Lay can hardly be accounted for in any other way, than by supposing him to have laboured under partial insanity. His zeal against slavery, against drinking tea, and smoking tobacco, was exhibited in a variety of ways, more or less manifesting aberrations of intellect. His imposition on Friends in their meetings for worship and discipline, by preaching and other actions, and his refusing to take the advice of the elders and other concerned persons, at last occasioned the Monthly Meeting of Philadelphia to issue this public testimony against him, at the meeting, held Sixth mo. 26th, 1737.

"Whereas Benjamin Lay, late of this city, a person frequenting our religious meetings, and pretending to be of us, on his arrival here, produced a certificate from Friends of the Monthly Meeting of Colchester, in that part of Great Britain, called England, which soon after, by an epistle from Friends of the Two Weeks' Meeting of Colchester, appeared, and by a minute of their Quarterly Meeting, we were informed, was irregularly obtained, and for that the said Benjamin did not properly belong to the said Monthly Meeting, and at the time of his application for the certificate, aforesaid, had been under dealing for his disorderly conduct, and had given Friends there no satisfaction. Whereupon he was advised by Friends here to endeavour to be reconciled to the meeting to which he properly belonged, and thereby entitle himself to their certificate, until which they were of opinion he ought not to be received as a member of this meeting. Yet the said Benjamin hath not only declined so to do, but in a disorderly manner, and against the mind of Friends hath taken upon himself to preach amongst us. We have, therefore, thought fit to give public notice, that we do not esteem the said Benjamin Lay to be a member of our religious community, but a disorderly and obstinate person, one who slights the advice of Friends, imposes on them in his preaching, and that disregards the peace of the church."

Believing that it would be right for him to fast forty days as his divine Master had on one occasion, Benjamin Lay commenced on the 17th of the Twelfth month, 1737. On the 22d, he thus writes at Abington.

"This morning early, after five days' and nights' fasting, I was considering the many calumnies which the world or people of the world have cast upon the saints and servants of the living God, my very dear, true, and faithful Friends in Christ, called Quakers, as if they kept slaves, or encouraged and connived at it for their interest, favour, or affection, or some base sinister end. But it is a mere slander, for they abhor the practice, and dare not touch with it, as verily believing it to be one of the grossest sins and iniquities, with all concomitants, in the whole world."

He admits that some leaders amongst the Quakers were connected with the abomination of slavery, but adds, "They were not all Israel, who were called Israel, Rom. Some were apostates, vagabonds and imposters, and they were some of the worst enemies, the very worst, the Hebrews had, and procured their ruin, overthrow and utter destruction." "And so it was amongst the primitive Christians, about the time of the 'ten persecutions,' when they got a little ease from the heathen tyrants, the apostate Christians went to the same devilish work of murthering and butchering the true Christians about their creeds, keep of Easter and other idols, and about the clause one substance and two substances, as if the e nal Being could be divided. Especially a Constantine, the Roman Emperor, was conver to the christian faith. In his zeal he gave large donations and revenues to the church tha is recorded, the same day there was a voice he from heaven, crying aloud, 'This day is poi poured into the church!' This the event s verified. By an ancient observation, 'Religi brought forth wealth, and the daughter devou the mother.' It is the very same now."

On the 25th, he walked to Philadelphia, visited Benjamin Franklin. The effect that fi ing had upon him, is singular, if the remark the philosopher is correct, that Lay's breath become so acrid as very much to affect his ey Notwithstanding this condition of his breath, thus wrote whilst in Philadelphia, concerning health. "This being the ninth day of my fa ing, having taken nothing but a draught of spr water several times a day, and am as well in hea as ever since I came to Pennsylvania, which [will be] six years this spring; it lies on my m to say something concerning extortion in pay or receiving interest for money, which I have be under exercise about a considerable time. I co be heartily glad that our Friends as a society wo wholly set it aside, although I have someth considerable upon interest myself, and nothi else to live on but the labour of my hands, weakly in body, and pretty well in years, be near sixty."

Having returned to Abington, he the next c wrote, "being the tenth day of my fasting," express his disapprobation of the dogma, th Christ was in heaven in a carnal body of fle After this he probably could not use his pen, strength failing. It is said that when unable leave his bed, he had a large loaf of bread plac before him, on which his eyes were often fixe "Benjamin," he would occasionally ejaculate dibly, "thou seest it, but thou shalt not eat i The advice of his friends on this, as well as oth matters, had no effect on Benjamin Lay. He w used to decide his line of duty for himself, and perform it as far as his strength and ability en bled him, no matter who opposed him, by arg ment or entreaty. When he had fasted th weeks, his faculties so failed that the memory his determined fast left him, and his watch friends perceiving this, gave him suitable fo He gradually regained his strength, and, as far we know, never again attempted an extended fa

From "The Leisure Hour."

The Value of a Worm.

mong the works of God there is nothing con-
ptible, nothing even insignificant: that which
as so is only in consequence of our limited
lties; the more inquisitively we look at nature
more occasion shall we have to exclaim with
dsworth:—

"Pride,
Howe'er disguised in its own majesty,
Is littleness; and he who feels contempt
For any living thing, hath faculties
Which he has never used."

have no better illustration of the importance
parently insignificant things than in the worm.
/hoever beholds the creature delving and wind-
through the mould, probably has thought how
ss a place it occupies in the scale of creation;
yet, what will our readers who are unacquainted
the fact think, when we assure them that
common earth-worm is at once shovel, plough,
ow, and manure? Of all that soil which is the
est and most adapted for the gardener's pur-
, there is scarcely any which has not passed
ugh the intestines of the worm, and the earthy
s which are seen lying about after its burrow-
, are little patches of rich mould which have
ved an extraordinary nutrition from the cause
ave mentioned. Mrs. Somerville, in her "Phy-
Geography," mentions it as probable that of
finer vegetable mould there is not a particle
h has not been prepared by this wonderful
e labourer.

is only recently that science has devoted
h attention to this interesting subject; but
fact to which we have alluded was placed be-
d dispute some years ago by Charles Darwin,
paper on the formation of mould, read
re the Geological Society of London. The
s performed by each individual worm may
n so insignificant as to place almost in doubt
possibility of an achievement so considerable;
this idea is refuted by the immense number
arth-worms constantly ploughing their way,
especially when driven by dry weather, to a
iderable depth below the surface. It is satis-
orily ascertained that no plough could reach so
as the worm, in many instances; and Mr.
win remarks that it would sometimes be much
e consistent to speak of animal mould rather than vegetable. It is both amusing and beautiful to contemplate how, by the agency of this little creature, nature buries stones, pebbles, and the rough earth which was too near the surface. Many of these, covered by the castings of worms, lie waiting for the disintegration and separation into finer particles, which in the course of some few seasons they may undergo, then in their turn to pass through the bowels of the worm and return to the surface as useful soil. Thus nature constantly operates around us without our being aware of it. How many persons have ungratefully supposed that these little creatures were to be regarded as a pest and nuisance. The farmer, the grazier, and the gardener, have beheld them without suspecting that they were an important fellow-workman; the farmer and grazier especially deriving benefit from them, since they work in fields where the spade cannot penetrate.

William Kirby slightly alludes to them in his Bridgewater Treatise on the "Wisdom of God in the Creation of Animals;" but since this volume was written, the earth-worm, as well as the whole class of worms to which it belongs, namely, the Annelida, has undergone a very lengthy and popular examination by Dr. Williams, who has published the result of his observations in a paper of some hundred and twenty pages in the report of the British Association for 1851. That paper unfolds in a remarkable degree the exquisite contrivance of nature in her most unobserved works, or, rather, let us say, the wonderful wisdom of God in the most unobserved of his creatures. The very name by which this class is distinguished by naturalists, the Annelida, is given to it from an early perception of the marvellous contrivance of its rings; for if the reader observes it, which he may verily easily do either by watching its movements in the mould, or placing it before his eyes on a table, he will see that its coil of blood-red rings are marked very plainly, and he will further notice, too, how all these assist it in the act of moving. The grace of the snake and the serpent has often been referred to; the proud beauty of that creature, so shunned by man, has been repeatedly made a subject of comment; but the beauty of the worm, to an eye capable of perceiving it, is no less remarkable; and although we would not place the serpent or the snake beyond the circle of the useful purposes of creation, yet the impression made upon the mind by the worm in this particular is much more interesting. We have watched it, industrious little peasant! hard-working little ploughman! as it has moved on, swiftly shooting its way through the soil, and we have wondered that it has not been a theme for poets. Its movements surely illustrate the poetry of motion; and indeed one of our later poets, Walter Savage Landor, has made the worm the subject of his song. The following lines are as just as they are beautiful in homage, of the subject of our paper:—

"First-born of all creation yet unsung,
I call thee not to listen to my lay;
For well I know thou turnest a deaf ear,
Indifferent to the sweetest of complaints,
Sweetest and most importunate. The voice
Which would awaken, and which almost can
The sleeping dead, thou rearest up against,
And no more heedest thou the wreck below;
Yet art thou gentle, and for due reward,
Because thou art so humble in thy ways,
Thou hast survived the giants of waste worlds,
Giants whom chaos left unborn behind,
And earth with fierce abhorrence at first sight
Shook from her bosom, some on burning sands,
Others on icy mountains far apart;
Mammoth and mammoth's archetype, and coil
Of serpent cable long, and ponderous mail
Of lizard, to whom crocodile was dwarf.
Wrong, too, hath oft been done thee. I have watch'd
The nightingale, that most inquisitive
Of plumed powers, send forth a sidelong glance
From the low hazel on the smooth footpath,
Attracted by a glimmering tortuous thread
Of silver left there when the dew had dried,
And dart on one of thine, that one of hers
Might play with it. Alas! the young will play
Reckless of leaving pain and death behind.
I, too, (but early from such sin forebore)
Have fasten'd on my book beside the stream
Of shady Arrow, or the broad mill-pond,
Thy writhing race. Thou wilt more patiently
Await my hour—more quietly pursue
Thy destined prey legitimate.

FIRST-BORN

I call'd thee at the opening of my song;
Last of creation I will call thee now.
What fiery meteors have we seen transcend
Our firmament, and mighty was their power
To leave a solitude and stench behind.
The vulture may have revell'd upon men;
Upon the vulture's self thou revellest.
Princes may hold high festivals; for thee
Chiefly they hold it. Every dish removed,
Thou comest in the silence of the night,
Takest thy place, thy train insinuatest
Into the breast, lappest that wrinkled heart
Stone-cold within, and with fresh appetite
Again art ready for a like carouse."

There is another remarkable feature in the worm. No organs of sense have been discovered, and yet it is all sensation; it sees without eyes, hears without ears, as truly as it walks without feet: it is a constant marvel. Like the human hand, it unites in itself the most opposite and various faculties: by the sense of touch it seems to supersede the necessity for other faculties. In all the contrivances connected with its formation, it seems evident enough that nothing has been omitted conducive to its happiness; it bounds to and fro with a merriment of motion which assures us that it is capable of enjoyment in its little circle of sensation and small world of action. Those who have anatomized it, speak of the exquisiteness of its mechanism; with rapture they laud the muscular feats of the Annelida as wonderfully distinguished by their complexity and harmony; and yet it is allowed to pass long without a chronicler and a historian, though no single creature in the whole compass of creation more illustrates the marvellous excellency of divine arrangement, or the dependency of man for his happiness upon the meanest of God's creatures.

Such were some of our reflections the other day, while wielding the spade in our garden; and then we very naturally turned from the worm to other characters in the scale of moral creation slighted like the worm, fulfilling a round of lowly duties unnoticed and unperceived. How many there are in society, the delvers, the diggers, and ploughmen, nay, even the unseen philosophers, who work silently and obscurely in the dark beneath the mould, but who have the same value attaching to them which, as we have seen, attaches to the worm—preparing the soil in which others are to place the seed—exploring the dark and the unsightly, and bringing it out into the light, that others may cause beauty and bloom to hang their brightness over it. Let us, in moral conditions, recur to the often uttered but never sufficiently felt truth, that nothing useful is mean or contemptible. How much soever the employment seems to stamp with contempt, let us constantly remember that not employment, but motive and object, are the foundations of real dignity; nay, that sometimes workers may be engaged in really dignified employment, important in itself and its results, although they may be entirely ignorant of the magnificence of the foundation they are preparing. The humblest action, it is pleasing to remember, is dignified, if done to the glory of God.

For "The Friend."

The Half-way Place.

Young persons generally, set out in life with flattering prospects of success in all their undertakings; but a few fleeting years are generally sufficient to convince them, "that disappointment is the lot of man," and that they must, from past experience learn more accurately to estimate for the future. Those who continue to persevere through difficulties, not suffering disappointments nor adversities to slacken their efforts to obtain the desired ends are generally successful, may it not be said, either as respects temporal or spiritual attainments. Are there not many who set forward in early life, with good intentions, and as they may think, with fixed resolutions, to lead an upright, godly life, and may have been favoured to overcome many of the enemies of their soul's peace, and been willing to make some sacrifices, but have stopped here; taking up their rest at the half way place? May it be the query of each of us, who are in the younger or middle walks of life, is this my present resting place? am I lured from the christian's path, into some of the by-ways and crooked windings of an earthly mind? Let us pause and consider. Are there not some sacrifices yet required of us, some besetting sin yet lurking within or about us, which causes the Divine light to be in great measure veiled from us? David said, "I will not offer unto the Lord my God an offering of that which costeth me nothing." He knew that an offering which cost nothing, would be worth nothing; that a lame offering, God would not accept. We also know it; why then deceive ourselves, and tempt God? Annanias and Sapphira aimed to make some sacrifice, but were not willing to offer all up: this is surely a notable warning for any of us, who are refusing to give up what we are persuaded is called for at our hands. What a band there is amongst us, approaching the meridan of life, endowed with talents, bright talents, which should be occupied to the honour of Him who gave them; but of some there is grounds to fear, that they will be buried in the earth. Could we be induced to place a proper estimate on those things which are not seen, except with the eye of faith, but are eternal, a less value would attach in our minds to those perishing things which will soon pass away forever. Why are we not wise, why do we not consider our latter end, why, after properly pursuing our journey for a time do we take our rest at the half way place? May we seek for help to be raised out of this polluted rest, and give all up, to become the humble followers of Christ. Will any thing short of this avail us in a day that is coming,—a day which none of us know how near it may be at hand,—when if we have not already obtained it, we would give the whole world were it at our command for peace of mind. I trust a secret breathing for help and strength has been begotten in the hearts of many amongst us, that the broken down walls in our midst may be rebuilt, the preparation for which must commence at home; we must be hewed and squared, and fitted, before the Master will use us. It would be in vain for man as man, with all his skill and ingenuity, rightly to set about the work, for whatsoever is not according to the will and direction of the Master Builder, he can and will frustate. May it therefore be the watchful care of the members of the Militant Church, not to put a hand even to steady the tottering ark, without the Master's bidding, and at the some time be ready and willing to do or to suffer in whatever way will most advance his righteous cause and the honour of him who is Head over all things to his church and people.

Ohio, Second mo., 1856.

The Snow.—The snow was proverbially called the "poor farmer's manure" before scientific analysis had shown that it contained a larger per centage of ammonia than rain. The snow serves as a protecting mantle to the tender herbage and the roots of all plants against the fierce blasts and cold of winter. An examination of snow in Siberia showed that when the temperature of the air was seventy-two degrees below zero the temperature of the snow a little below the surface was twenty-nine degrees above zero, over one hundred degrees difference. The snow keeps the earth just below its surface in a condition to take on chemical changes which would not happen if the earth were bare and frozen to a great depth. The snow prevents exhalations from the earth, and is a powerful absorbent, retaining and returning to the earth gases arising from vegetable and animal decomposition. The snow, though it falls heavily at the door of the poor and brings death and starvation to the fowls of the air and beasts of the field, is yet of incalculable benefit, in a climate like ours, and especially at this time, when the deep springs of the earth were failing and the mill streams were refusing their motive powers to the craving appetites of man. If, during the last month, the clouds had dropped rain instead of snow we might have pumped and bored the earth in vain for water; but, with a foot of snow upon the earth and many feet upon the mountains, the hum of the mill stones and the harsh notes of the saw will soon and long testify to its beneficence. Bridges, earth works, and the fruits of engineering skill and toil may be swept away, but man will still rejoice in the general good and adore the benevolence of Him who orders all things aright. The snow is a great purifier of the atmosphere. The absorbent power of capillary action of snow is like that of a sponge or charcoal. Immediately after snow has fallen, melt it in a clean vessel and taste it, and you will find immediately evidences of its impurity. Try some a day or two old and it becomes nauseous, especially in cities. Snow water makes the mouth harsh and dry. It has the same effect upon the skin, and upon the hands and feet produces the painful malady of chilblains. The following easy experiment illustrates beautifully the absorbent property of snow: Take a lump of snow (a piece of snow crust answers well) of three or four inches in length and hold it in the flame of a lamp; not a drop of water will fall from the snow, but the water as fast as formed, will penetrate or be drawn up into the mass of snow by capillary attraction. It is by virtue of this attraction that the snow purifies the atmosphere by absorbing and retaining its noxious and noisome gases and odors.

The Coal trade for the year 1855.—The Pottsville Miners' Journal publishes its annual tables of the coal operations in the Schuykill region, from which we copy some interesting tables. The total amount of coal of all kinds sent to market from the Schuykill, Lehigh, Wyoming, and the semi-anthracite and bituminous regions during the year was 7,587,502 tons, an increase of 684,004 tons over the amount the previous year. There has been an increase from every region engaged in mining during the year—the largest from the Pittston, Wilkesbarre and Nanticoke portion of the Wyoming Coal region, lying below Scranton and the Lackawanna region. The Schuykill region is prepared to increase its production 300,000 tons this year, should there be that demand for it, which it is believed will be so, in consequence of the fall of provisions and the increased impetus given thereby to the manufacturing interests. The Lehigh region is prepared to furnish a considerable increase this year, as well as the Scranton region with the new branch of their road completed l ing to New York. Both these roads now open coal regions directly to New York city. The oming region will also have a new outlet with completion of the North Branch Canal, and improvement of the White Haven Railroad l ing from Wilkesbarre to the Lehigh. The Sha kin region has also another outlet *via* the S bury and Erie Rail-road leading to Williams and from thence into the interior of New Y The number of engines used for mining purp in Schuykill county is 315, with an aggreg power of 10,653 horses. The number of mile railroad in the county is 430. The numbe locomotives running on the lateral railroads is independent of those on the Reading Railro —*Ledger.*

For "The Friend

On the Value of Religion.

Those who possess the soul-sustaining power Religion will experience it to be a safe anchor the mind, when it may at times feel almost ov whelmed by the waves of affliction, oft permit to attend us in this world; which may be co pared to a stormy sea, wherein there are m shoals, against which it is the duty of all to gua in order to prevent being shipwrecked there and thereby miss an entrance into a blissful harbo a never-ending eternity; to gain which, the H Pilot must be sought and followed, even Him w leadeth in ways that we have not known, and structeth us to know that he is our guide. St need not be afraid, though difficulties and dang assail them on every side. As each one is willi to look to the Lord of life and glory for His rection and his protecting care, and as they willing to follow Him in the strait and narrow w which He has been pleased to cast up, for all th who are really and truly his disciples, he w assuredly bestow on such in the time of great need, that Wisdom which will direct aright; a will enable those who put their trust in Him, a fully obey him in what he requires, to discover many hidden snares laid by the enemy of all rig eousness, to deceive and draw away from Him w is ready to save all that in sincerity give th hearts to him and follow him as the Captain their soul's salvation.

May those who peruse these lines and who m realize that they have not partaken of those pureje which true religion gives; be willing, ere it be late, to seek that heavenly treasure; the "pearl great price," which is of more value than any the alluring unsatisfying pleasures this world c bestow; for those joys which appertain to t possessors of true religion are enduring and w never pass away.

When the rays of this world's prosperity around us and there are no clouds of earthly s row to mar our outward enjoyments we may f secure in them and be tempted to take up our r in temporal gratification, but we should remem that it has been recorded in Holy Writ; that this world we have no "continuing city."

Maryland, Second mo., 1856.

For "The Friend.

As the readers of the "Friend," in common w other "anti-belligerents" may have a choice occasionally meeting with an article of a pac character from the other side of the Atlantic would suggest whether the tone and temper of following extract (from the London Athenæu does not so ably contrast with many fierce often intentionally irritating essays on the "V topic," as to render it an acceptable article for columns.

War with the United States! The idea of h a war is incredible. If there be in the cata-ue of mortal calamities a "worse than Civil War," such a conflict as might arise between Ame- and England. A civil war has generally some s in reason. Some grand principle is at stake. sword is drawn in defence of freedom—in de-e of property—in defence of religion. As in own civil war, a certain degree of romance, of valry, and of intellectual activity, often springs n the conflict and flourishes after its close—the ssom and the fruit of a splendid and deadly con-. But a war against America would have no gle redeeming point. There is not—and there er ought to be—any real ground of quarrel h the United States. The interests of the two tries are identical. Their moral principles the same. They have neither a language to rate nor a religion to estrange them. The e blood flows in the veins of their people. y have a common history—a common literature common tradition. They possess the same le. They read the same Shakspeare and the e Milton. Blake conquered and Cromwell d for both. They have an equal interest in eigh, in Vane, and in Penn. Nay, their pre- state is as inseparable as their past. They live by the light of the same old Saxon laws. y still drink at the same intellectual fountains, rdless whether the springs lie on the eastern he western shores of the Atlantic. Irving, ant, Bancroft, Hawthorne, Longfellow are ad-ed with as warm an affection in England, as are ckeray, Tennyson, Dickens, Jerrold, in Ame- A war between America and England would war of brothers—a war of friend against friend. ould be a war against the affinities of race, nst the unity of religion, against the inter-nges of trade. It would be a war in favour of barism, piracy, restriction—a war against the nties of Nature, the enterprises of genius, the nces of civilization. Such a war would bring ow into every Anglo-Saxon home in Europe America, and a feeling of shame and humilia- into every Anglo-Saxon heart, in whatever rter of the globe it beats.

We say nothing about material interests. They or much, but the moral interests far outweigh n. The interchange of thought is more im-ant than the interchange of cotton. And for t are we threatened with an interruption of our dly relations with our American kindred? Is principle at issue? Are our liberties threat-l—is our property unsafe? Not in the least ree. Only three slight and miserable causes quarrel appear—a dispute about the construc-of a treaty regarding that interesting savage, King of Mosquito,—a dispute about some tched sandbanks lying off Balize—and a dis-e about the attempt to enlist troops for the nea. The first two are quite insignificant. We ht as well go to war about the sovereignty of Pie Island. We may be right, or we may be ng in our interpretation; the Americans think re wrong. There is much to be said on both s; and we all know that when private persons gree about trifles, a courteous and conciliatory soon removes the cause of quarrel. About third point—the attempt to enlist in the Re-lician territory—we are unquestionably in the ng. In neither case is our honour engaged, in her case does any principle, which ought to be ntained, stand behind the formal terms of the greement—thus presenting a true ground of rrel, as in the Russian war, which the genius he nation can seize and accept. Our statesmen ht—and must—find in the resources of diplo-y a means of satisfying all interests without an insane appeal to the sword. Where we are clearly wrong, we should at once and fully admit our error, making whatever reparation is fairly due. It is said the Washington Cabinet requires the withdrawal of Crampton. Surely this is no extreme or revolutionary request. Personal unpopularity has always been considered a sufficient reason for requiring the withdrawal of an ambassador. We could give a hundred instances in which sovereign powers have exercised this right. Under such circumstances withdrawal does not imply censure. It merely implies that the personal relations of the ruler and the minister have become such as to impede the transaction of public business. We were wrong in attempting to recruit within the Union. Crampton was the instrument of the wrong. He has thereby rendered himself an object of suspicion at Washington. His withdrawal, therefore, at the request of the American Cabinet, would be in accordance with usage, and would be a sure pledge of the sincerity of our acknowledgment of the original error. Strong nations can afford to be graceful in their concessions.

"The other points are less clear. Yet, if a proper spirit of conciliation presides at the discussion, we have no reason to fear a permanent disagreement. We have a right to expect that our diplomatists and public writers will approach the discussion in a pacific mood. Above all things, we deprecate a menacing tone. We cannot read without indignation the elaborate display of our naval and military powers which some of our journals have thought proper to make. Every Englishman feels that he would not be put down by such a parade; and we must not forget that our descendants in America are just as haughty as ourselves. They have our blood, our passions, our acute sense of personal honour. Against ourselves the threat of force is the one argument that is sure, under all circumstances, to fail. Nor will the Americans be cowed by a menace of the Baltic fleet. We must argue our point as if no fleets were in existence, and take our stand on the ground of history and reason."

THE FRIEND.

THIRD MONTH 15, 1856.

In our last number, we gave an account of the murder of a child by its mother, in order to prevent it being carried back into slavery; the following extract exhibits slavery in a different phase, demonstrating the deadening, debasing effect it has in very many instances on those who are the active agents in maintaining the direful system, and in carrying it into effect. The account originally appeared in "The Cincinnati Commercial," and is confirmed by an inhabitant of the town where the dreadful deed was enacted, who signs himself "Aberdeen," fearing, we suppose, some violence, should he become known. It needs no comment. The writer says:—

"Sir: I cut the following extract from The Cincinnati Commercial, which is the very first public notice that has been taken in any form of the awful tragedy that was enacted here—neither of the papers published in this city having given the slightest account of the matter, believing, doubtless, that so small an affair as burning a slave to death by way of a Thanksgiving frolic is not worth publishing:

"'We are informed that on the Kentucky Thanksgiving Day a couple of young men of Maysville, whose family connections are described as of the 'highest respectability,' were on a drunken spree at the Parker House in that place, and protracting their frolic until a very late hour, after all the household had retired to bed, attempted to arouse the barkeeper to procure more liquor, and failing in this, and succeding in finding a yellow man, one of the waiters, asleep, they concluded to *set fire to him in order to awaken him!* With this view they took a camphene lamp, and pouring the fluid over his whiskers, ignited it, and the poor fellow's neck and head became instantly wrapped in an intense blaze, which continued until the fluid was consumed. The sufferings of the victim were dreadful in the extreme. No refinement of torture could have produced more excruciating misery. But, strange to say, death did not release him from torment until after the lapse of two weeks. The poor creature was the slave of Ball, keeper of the Parker House, who says, as our informant tells us, that no human suffering could exceed that of his boy during the fortnight that he lived after the burning. The young men, 'respectably connected,' whose drunkenness resulted in this horror, are said to allege that they burned the negro by accident—that when holding the lamp to his face they managed to break it and spill the fiery fluid upon him. The young men are *rich*. They have agreed to pay Ball $1,200 for the loss of his servant. Our informant says that no one in Maysville speaks of this transaction without a shudder of horror, but that no movement has been made toward a legal investigation of the matter, and that the 'high position' of the parties implicated will overawe any such movement. We ask the citizens of Maysville, in the name of their honour, if these things can be true?'

"The facts set forth in The Commercial are true, and are put in the mildest form, for it was a deliberate act of torture; flagitious beyond all precedent, ending in death after two weeks of suffering on the part of the victim; albeit the parties were on a drunken frolic, and, as the world goes, were quite 'respectable.' No examination of the circumstances had taken place, nor will there be any; the money of the friends of the parties, together with the official relative of one of them, being amply sufficient to protect them.

"They carry their heads as high as if nothing had happened, and talk about the amount they had to pay the owner of the slave as rather expensive, considering it was done for a bit of fun!

"Is not this a creditable state of things, and is it not one more powerful illustration of the beauties of slavery? Can't you get some of your Northern 'Divines' to preach in favour of the system from this text?"

Maysville, Jan. 1856.

SUMMARY OF EVENTS.

EUROPE.—The steamship Africa arrived at New York on the 8th inst., bringing Liverpool dates to Second mo. 23d. She brings no tidings of the missing steamship Pacific, which may now be given up as lost. The Pacific's officers and crew numbered 141; her passengers were 45 in number, making in all 186 persons on board. It was supposed the Peace Conference would open on the 25th ult. Great anxiety was felt as to the result, but it was generally supposed a peace would be concluded, such being the desire of the French government. The editors of the newspapers in Paris are ordered to write no more respecting war or peace while the Conference is in session. Letters from St. Petersburgh and Warsaw, in the German papers, give details of the preparations in progress for the continuance of the war, and state that on no point has the former energy of the military department been abated. The health of the armies in the Crimea is said to be remarkably good. The French engineers have effected the complete destruction of Fort Nicholas in South Sebastopol. About 120,000 pounds of powder was employed in its destruction. The Russians kept up a desultory fire from the north side, which caused the Allies but little injury.

GREAT BRITAIN.—The government has negotiated a new loan of £5,000,000. It was all taken by the Rothschilds at a rate equivalent to 90 for three per cent. consols. John Sadlier, M. P., had committed suicide. He appears to have been guilty of frauds and forgeries to an immense amount, perhaps, a million of pounds. His crimes are said to exhibit a combination of boldness, ingenuity, versatility and tact, almost without a parallel. *Liverpool Market.*—Sales of cotton for the week, 50,870 bales; prices had declined from 1-16 to ⅛d. Business in Manchester was dull. Breadstuffs were in better demand, and prices had improved. Philadelphia and Baltimore flour had advanced from 1s. to 2s. / Indian corn was also advancing in price. Consols, 90½ to 91.

UNITED STATES.—*The Pacific Whaling Fleet.*—Whitney's Whalemen's List, published at Honolulu, Sandwich Islands, Twelfth mo. 31st, says that the average season's catch of "right whales" to each ship has been 1022 barrels of oil and 11,110 lbs. of bone, and

the grand total taken by the fleet this season, as reported, is 226,626 bbls. whale oil, and 2,443,230 lbs. of bone. Other vessels have obtained furs, ivory and skins, and whales have never been so numerous in the North Pacific as this season.

Immigration to Texas.—Immigration continues to pour into Texas in a steady stream. It was recently stated that at one time five thousand slaves were on the road, together with long trains of wagons and numerous families.

Congress.—The Senate has passed a bill for the construction of ten sloops of war at an estimated cost of $5,070,000. The present bill appropriates $2,000,000 towards that object. Another bill has been reported making appropriations for fortifications and other works of defence. The Committee on Elections in the House of Representatives having made a report, presenting their reasons for renewing their demands for authority to send for persons and papers in the Kansas contested election case; the subject has been earnestly discussed in the House. The indications are, that Whitfield will be allowed to retain his seat. The Senate bill for the construction of ten sloops of war, was referred to the Committee on Naval Affairs. A bill to prevent the introduction into the United States of foreign criminals, paupers, lunatics and insane persons, has been referred to the Committee on Foreign Affairs.

Cincinnati.—The total value of exports from this city in 1823, was estimated at $855,900; in 1855, at $60,000,000. The pork trade amounts to about fourteen millions annually. The total number of steamboats employed on the Ohio and Mississippi rivers in 1823, was 80. In 1855 there arrived at this port 2915 different boats, and this embraced, perhaps, only two-thirds of the steamers employed on the Western waters.

New Orleans.—The City Treasurer, Col. Garland, is reported to be a defaulter, to the amount of $200,000. He attempted to escape, but was overtaken and committed to prison, to answer the charge. Two persons charged with being his accomplices, have also been lodged in prison.

St. Martinsville, La.—On the 17th ult., a fire broke out in this town, which soon spread to a large and handsome block of stores. In one of these, about 40 kegs of gunpowder were stored, which exploded, scattering ruin and destruction around. Thirteen persons were instantly killed, and up to last accounts, seventeen bodies had been found, and several others were missing. The loss of property is supposed to reach $200,000, very little of which is thought to be insured.

Philadelphia.—Mortality last week, 206. The persons convicted, last term of the Quarter Sessions, for selling liquor on the first day of the week, have each been sentenced to a fine of $50, and thirty days' imprisonment. The parties implicated were some of the principal tavern keepers in the city. The spring trade has fully commenced, and the "jobbing houses" seem to be full of business.

Destruction of Cotton Mills.—The Essex Cotton mill at Newburyport was destroyed by fire on the 6th inst. Loss, $90,000. The factory of Charles Kelly, in the twenty-fourth ward, Philadelphia, was burnt on the 7th. Loss, $130,000.

The Weather.—In the middle and northern States, there are as yet no indications of spring. On the 10th inst., the thermometer in exposed situations fell at Philadelphia to zero. In Boston it stood at zero. At the White River Junction, 26° below. In the vicinity of Albany, from zero to 7° below.

New York.—Mortality last week, 394, of which 98 were from consumption and other diseases of the lungs. The shipments of specie for the week, amounted to $1,204,746.

Slavery Items.—The Governor of Ohio has made a requisition upon the Governor of Kentucky for the return of the slave woman, who recently killed one of her children in Cincinnati, and who was returned to slavery by the U. S. Commissioner.

According to the Cleveland Ledger, more than two hundred and fifty slaves escaped from Virginia and Kentucky, during the Second month, 1856.

Miscellaneous.—*Indians in Texas.*—Returns from the Indian Agencies in Texas, show that the State contains 20,000 Camanches and Kioways, 3000 Arickarees, 800 Waccos, Towacanoes and Keechies, 500 Lipans, 400 Mescalegros, 960 Wichitas, and Apaches, Cadoes and other tribes in numbers not estimated, but mostly small.

Large Supplies of Sugar.—A Cincinnati paper of the 5th says, "Yesterday and the day before, there were twenty-one arrivals of steamboats at this port from New Orleans, bringing 10,000 tons of groceries, among which are 5000 hhds. sugar, and 10,000 barrels molasses."

The Fugitive Slave Law.—The Cincinnati Gazette states that, during the late slave trials in that city, four hundred persons were sworn in as special or deputy marshals, and that the aggregate sum allowed them for their services, amounts to $22,400.

The Death Penalty.—A bill giving to Judges of Superior Courts the power to commute the punishment for capital offences from death to imprisonment for life in the Penitentiary, should the jury recommend the prisoner to the mercy of the Court, has passed the House of Representatives of Georgia, by a majority of 72 to 25.

Kansas.—The Savannah Republican intimates that several companies of emigrants from that State are about proceeding to Kansas, but says that few, if any of them, are slaveholders, and that no slaves accompany them. The Republican doubts if even the votes of these men can be relied on, and mentions the case of a party of nine who went last year from one of the upper counties of Georgia, eight of whom afterwards voted with the Free State men.

The Czar and the Pope.—The latest advices from Rome confirm the report that the Emperor of Russia is doing all in his power to conciliate the Papal Government, by affording facilities for the establishment in Russia of the Roman Catholic worship.

Liberation of Slaves.—The New Orleans Commercial Bulletin tells us that cases of the voluntary emancipation of slaves are continually occurring in the Courts of that city, and that the slaves thus liberated, in almost every case, fully vindicate the good policy of their emancipation. The Bulletin observes: "Many of these slaves thus set free, become the owners of property, and some of them even rich; and, singular as it may appear, many of them become in turn slaveholders themselves."

Steel Pen Manufacturing.—At a recent trial in Paris, between a steel pen dealer of that city, and Hinks & Wells, the manufacturers, of Birmingham, it was stated that in the whole world there are but fourteen manufacturers of steel pens, and that nine of them are at Birmingham, four at Boulogne-sur-Mer, and one at Paris.

China Manufactory.—The recently established porcelain manufactory at Gloucester, N. J., near Philadelphia, is said to be in successful operation, producing wares which compare favourably with those imported from Europe.

Prohibition in Canada.—Resolutions favouring the enactment of a Prohibitory Liquor Law, have been lost in the Assembly by one majority. A stringent license law was subsequently passed by a large majority.

Weather in Florida.—Florida papers speak of the delightful spring weather, many of the earlier leaved trees being already clothed in living green. The Alligator Advertiser says, "The cropping season is fast approaching, and our planters are getting ready for it. We saw a field of corn planted two weeks ago."

A Large Animal.—A Russo-Chinese hog weighing 1400 pounds, was recently exhibited at Cincinnati; he was raised in Clinton county, Ohio.

Another Asteroid.—The 39th asteriod was discovered, on the 8th ult., by Chaconac, of the Paris Observatory.

Dr. Kane's Charts.—The British Board of Admiralty have notified our government, that they have accepted Dr. Kane's Charts, thus preferring them to the works of all his predecessors on the coasts of Greenland.

Colonization Fund.—The House of Representatives of Georgia has passed an act that the tax now imposed in that State upon free persons of colour, shall be set apart as a fund to be applied to transporting this class of people voluntarily beyond the limits of the United States, and those so disposed may voluntarily return to servitude.

France Buying Steamships.—A late English paper says, "On Saturday the purchase was made of the General Screw Steam Shipping Company, of the Jason, Indiana, Golden Fleece, Calcutta, Argo, Queen of the South, Hydaspes, and Lady Jocelyn—amounting, we hear, to nearly £500,000.

A Singular Exportation.—A vessel lately left San Francisco for China, having as a part of her cargo one hundred and seven coffins, containing the bodies of dead Chinese. This is explained in this way: Chinese speculators hire large bodies of men in China to work in the mines of California. The bodies of those who die there are taken back, to prove to those from whom they were hired that their services were at an end.

RECEIPTS.

Received from Sl. B. Smith, agt., O., $2, vol. 29, for Paul Seers, $3, to 26, vol. 29; from A. E. Winn, $2, vol. 28, for B. Ellyson, $2, to 29, vol. 30; from Sl. Leeds, B., N. J., $2, vol. 27; from Wm. Thorne, per Sl. C., Canada W., $2, to 27, vol. 30; from Chas. Perry, agt., R. I., for N. S. Babcock, $2, vol. 29.

FRIENDS' ASYLUM.

A stated annual meeting of "The Contributors t Asylum for the Relief of Persons deprived of the u their Reason," will be held on Fourth-day, the 19 Third month, 1856, at 3 o'clock, P. M., at Arch s meeting-house, Philadelphia.

iam Penn: an Historical Biography.—y Hepworth Dixon. A new edition, with a ply to T. B. Macaulay's Charges against Penn, apman and Hall.

e shall abstain from expressing any opinion controversy between H. Dixon and T. B. ulay. But as many of our readers look to our ns exclusively for a record of literary facts, hall present a few extracts from the defence un against T. B. Macaulay's accusations. We present these without comment, and leave eader free to draw his own conclusions. Of e, the reader will understand that our exs offer only a small part of the defence, and they do not here follow their natural sequence e "reply."

MR. DIXON'S STATEMENT.

ith the first impression of this memoir I issued apter on Mr. Macaulay's charges against n. I called it an extra chapter, and placed it e end of my volume, having no desire to see m a permanent part of the work. The more rtant organs of critical opinion received the ace of Penn as conclusive; and I had reason fer that Mr. Macaulay acquiesced in the non verdict. The Edinburgh Review, the n of his party, and the defender of his fame, ed that the most serious charge against Penn, disproved by evidence. My object, therefore, riting the extra chapter, appeared to have gained. In the belief that Mr. Macaulay d withdraw his accusation as an error, when pular edition of Wm. Penn was passing through press, I withdrew the extra chapter from the ic eye, promising merely to reproduce it in roper place—the appendix to a literary edi-

This abstinence is no longer just towards public. A character like that of Penn, is a d inheritance. Mr. Macaulay has *not* with- n his charges. In the 11th edition of the ory of England, bearing the date of 1856, n still appears as the Pardon Broker, who ac- d an infamous commission from the maids of ur—as the agent employed to seduce Kiffin—ideavouring to persuade the Prince of Orange upport the Declaration of Indulgence—as a of the Jesuits—and as trying to corrupt the ws of Magdalen. Not a word is withdrawn. harge is softened. All proof of mistake is looked. In the 3d and 4th vols. of the His- of England, the same principle of incessant sation prevails. Every reference to Penn is accompanied by an epithet. His conduct is spoken of as "scandalous"—his life "as unfavourable to moral purity"—his word as a "falsehood." Yet, from first to last, not *one fact* inconsistent with the highest character and the purest principle, is proved against Penn.

PENN ACCUSED OF FALSEHOOD.

"Did Penn excuse himself to the council with a falsehood?" Mr. Macaulay writes:—

"Among the letters which the Government had intercepted, was one from James to Penn. That letter, indeed, was not legal evidence to prove that the person to whom it was addressed, had been guilty of high treason; but it raised suspicions, which are now known to have been well founded. Penn was brought before the Privy council, and interrogated. He said very truly, that he could not prevent people from writing to him, and that he was not accountable for what they might write to him. He acknowledged that he was bound to the late king by ties of gratitude and affection, which no change of fortune could dissolve. 'I should be glad to do him any service in his private affairs; but I owe a sacred duty to my country, and therefore I never was so wicked as ever to think of endeavouring to bring him back.' This was a falsehood."

Mr. Macaulay quotes Gerard Croese. Croese is a poor authority. He knew little of his subject, and was unscrupulous in his use of facts. But such as he is, he does not afford a ground for Mr. Macaulay's accusation. Croese reports one part of Penn's speech, which is of importance. Penn told the council the reason why he was grateful to James personally, and yet could not desire to see him back as king. *He had never been able to agree with him in State affairs.* Why does Mr. Macaulay suppress this passage? In a few words it explains the relations of king and Quaker. Penn felt towards James as a ward ought to feel towards a guardian; but there is the amplest evidence that he was opposed to his political and religious views. Van Citters wrote:—"Penn has had a long interview with the king, and has, he thinks, shown to the king, that Parliament will never consent to a revocation of the Test Act and the penal laws, and that he will never get a Parliament to his mind, so long as he rejects moderate counsels, and refuses to drive away from his presence, (or, at least until he refuses to listen to,) the immoderate Jesuits and other Papists, who surround him daily, and whose advice he now follows." Clarendon says in his diary, that Penn "laboured to thwart the Jesuitical influence that predominated." Johnstone says expressly, that Penn was against the order, commanding the Declaration to be read in the churches. Penn advised the king to release the bishops; and he pleaded for a general amnestry to the exiles. He counselled James to submit to the will of his people, and be content with a toleration of his religion. Most of all he advised the king against relying on the Catholic king of France, in preference to the good sense and high spirit of his own countrymen. As Van Citters says:—"He has advised the king, so long as his affairs at home are so changeable, and remain so uncertain, above all things to be cautious in his connexion with France lest the country should be discontented." The truth is, James regarded Penn as a young fellow of very good parts and very odd opinions. He thought him a dreamer; and he allowed him a freedom of speech and remonstrance such as few men have ever exercised in a king's closet, *because* he entered that closet as a private friend, not as a public man. Though James himself was always glad to see the son of his old comrade, the admiral, James's ministers treated him as a foe, and James's foes treated him as a friend. As a public man, Penn was the friend of Algernon Sidney and John Locke; and the supporters of Monmouth set him down in their secret lists as favourable to their cause. How in the face of all this evidence that while James was on the throne, Penn *did* oppose his policy in speech, in writing, and in thought—can this simple statement before the council, that he respected James personally, yet did not wish to see him restored as king; be termed "a falsehood?"

"VERY LIKE A LIE."

Did Penn tell Lord Sidney something very like a lie, and confirm it by something very like an oath? Mr. Macaulay writes, "Sidney received from him a strange communication. Penn begged for an interview, but insisted on a promise that he should be suffered to return unmolested to his hiding place. Sidney obtained the royal permission to make an appointment on these terms. Penn came to the rendezvous, and spoke at length in his own defence. He declared that he was a faithful subject of king William and queen Mary, and that if he knew of any design against them, he would discover it. Departing from his yea and nay, he protested as in the presence of God, that he knew of no plot, and that he did not believe there was any plot, unless the ambitious projects of the French Government might be called plots. Sidney, amazed probably by hearing a person, who had such an abhorrence of lies, that he would not use the common forms of civility, and such an abhorrence of oaths, that he would not kiss the book in a court of justice, tell something very like a lie, and confirm it by something very like an oath, asked how, if there were no plot, the letters and minutes found on Ashton were to be explained? This question Penn evaded."

"I entreat Mr. Macaulay to re-read Lord Sidney's letters, the sole authority for his statements. There is no mention in it of any 'hiding place.' Sidney says, 'I found him as he used to be, not at all disguised, but in the same clothes and the same humour I have formerly seen him in." Sidney never hints that he was "amazed" at Penn's words. Sidney never suggests that he thought Penn was telling anything "very like a lie." Sidney evidently believes Penn's words. Mr. Macaulay declares that "he (Penn) assured Sidney that the most formidable enemies of the government were the discontented whigs." Sidney's letter never names the discontented whigs. Sidney does not say that he asked how the letters and minutes which had been found on Ashton, were to be explained." Mr. Macaulay makes Penn say, very nonsensically, "The Jacobites are not

dangerous." Sidney makes him say something very sensible and very true; that some of those who came over with William, and some of those who were the first to join him, "were *more* dangerous than the Jacobites." Mr. Macaulay's 3d and 4th volumes are an elaborate vindication of the truth of Penn's statement."

"PENN, NOT A JACOBITE."

"A Jacobite was not necessarily a rogue. Many of the best men in England were Jacobites. The most pious and learned men in the church, the most independent of the country gentlemen, were Jacobites. But Penn was not a Jacobite; he did not share the king's views; although gratitude and early association attached him personally to king James. King James was William Penn's guardian. The old admiral had written to the Duke of York from his dying bed, to solicit good offices for his son; and the Duke had cheered the dying sailor with an assurance, that he undertook the office of guardian and protector of the youth. James had fulfilled his pledge. He had helped Penn out of the tower, and more than once had interfered to protect his co-religionists. He had conveyed to him his American province, and had supported his title to that property against all claimants. As Penn told the deputies of Magdalen College, the questions which had made him so intimate with James, were such as affected his property, not his religion. All that is odd in the correspondence of king James and William Penn becomes clear, when it is remembered that the aged king and the young Quaker stood in the relation of guardian and ward; a fact which Mr. Macaulay has forgotten."

PENN ON INVASION OF ENGLAND.

"As to the charge of doing his best to bring a foreign army into the heart of his country, Mr. Macaulay prefers the charge, and cites an ambassador, Avaux, as witness. The moment his witness enters the court, his case fails. Avaux never says that Penn did his best to bring a foreign army into the heart of his country; he never suggests any such idea. Attention to dates and minute facts, is of consequence when dealing with extremely loose assertions. Mr. Macaulay says, "Penn wrote to inform James." Avaux never says the letter was written to James. It may have been an ordinary letter to a private friend. Penn had property in Ireland, and many of his friends lived in that country. Mr. Macaulay says, Avaux thought Penn's letter so important that he sent a translation of it to Louis. Avaux sent no translation of it to Louis. At most he only embodied a few lines in a budget of news from England and Scotland. Mr. Macaulay places the passages cited above in his narrative of the year 1690, after the capture of Charlemont. But Penn's letter was written in the previous year. Avaux's despatch is dated June 5th, 1689; and Penn's letter, (to whomsoever it was addressed,) must have been written in an earlier month, as the means of communicating with Ireland were very irregular—probably in April, before the king and queen were crowned, and in the first excitement of the revolution. The date may help to explain the supposed contents of the letter; and considering the relation of the two men, and the phrenzy, it will probably appear to most readers remarkably cold and neutral. Avaux nowhere represents Penn as desirous to see foreign troops in England. Avaux makes Penn say, "The Prince of Orange begins to be disgusted with the English." At the same date, Mr. Macaulay says the same thing. Avaux makes Penn say, 'the aspect of affairs is changing fast, as is usual with the English." Mr. Macaulay says the same thing: "The ill humour of the clergy and the army could not but be noticed by the most heedless * * *; but the discontent was not confined to the black coats and the red coats. The enthusiasm had greatly abated before the close of February. The public was as it always is during the cold fits which follow its hot fits, dissatisfied with itself, dissatisfied with those who had lately been its favourites." Avaux makes Penn say, the health of William is bad. Mr. Macaulay says the same thing: "His constitutional asthma made rapid progress. His physicians pronounced it impossible for him to live to the end of the year." So far it is possible that Avaux may be following Penn. The next sentence in the budget of news cannot come from the same source as it refers to Scotland:—"A mist is gathering in the north of the two kingdoms where the king has many enemies, which causes great anxiety to the partisans of the Prince of Orange; these being wealthy, begin to fear that their fate will be decided by the sword, which they have been above all things anxious to avoid. They apprehend an invasion from France and Ireland; in which case the king would have more friends than ever. Commerce is ruined not so much by the Turks as by the fear of a war with France, and even by our own fleet." Yet whoever wrote these words, wrote no more than Mr. Macaulay repeats under the same dates, and at a length unmanageable in quotation. The facts stated were true. James *had* a great many friends in the north, and the loyalists clung to his family for three generations. The men who were the first to join William on his arrival in England—Danby, Russel, Shrewsbury, Marlborough, Godolphin—*were* afraid of a restoration by force. They expected an invasion from France and Ireland, and they dreaded such an event as the signal of their own overthrow. Mr. Macaulay asserts that Penn convinced "the old tyrant," that he "could only recover his dominions sword in hand." Avaux says no such thing. He says that the "letters from Scotland and England" have produced a good effect—putting first, the Scottish news, which, the reader will see, was very warlike and hopeful. There is nothing in that part of Avaux's budget, which can possibly have been taken from Penn's correspondence, to induce such a conviction in the mind of James. Such seems to have been the opinion of Louis himself, who, in his reply to Avaux's budget of news, treats the news from England, as of no importance, but pays a particular attention to the news from Scotland."

The foregoing are quoted merely as examples of the way in which Mr. Macaulay's accusations are met. Every assertion is sustained by an authority, and the originals are cited in the notes. More than this we abstain from saying.

A Watch-Word.

Selected.

Without holiness no man shall see the Lord.

The most direct and powerful means of promoting the Saviour's kingdom, is the vigorous cultivation of our own growth in grace. There is a great tendency among Christians to look too much away from themselves, and think that they are to do good to their fellow-men by bustling efforts, bearing directly upon them, without the light of a high and consistent and unsullied example of holiness. "Ye are the salt of the earth," said our Saviour, and the very expressive metaphor seems to imply, that Christianity is to influence mankind, not so much by its outward and open triumphs in the world, as by silent and unseen, and yet most powerful operations of its principles in the hearts and lives of its professors. We are all far more willing to watch one another, th watch ourselves. It is easier and more plea to see the faults of others than our own. there is unquestionably such a fault as t ing our thoughts too exclusively to ourselv but such cases are rare. The mass of Christi especially in this busy age, are far more incl to be watchful over all their neighbours than themselves; and especially to see the badnes heart, and the base ingratitude exhibited by ot whilst they overlook their own. The best wa spread religion, is to exemplify it. The Chris armor consists of the Christian graces, and with these that victories really valuable, are t won. It is easier, with hearts such as ours give money, to exhort, or to write good advic others, than to come and humble ourselves, crucify the flesh, with its affections and lusts, then you wish to do anything effectual for Saviour, *look within*. Labour first, and most stantly, with your own heart, so that the ligh pure religion may beam in beauty and gentle there. The world around will see and feel power; many will be led by it to the foun which has purified you; they will follow example; they will imbibe your spirit; and t while coming nearer and nearer to the Sav yourself, you will, in the most effectual man extend his kingdom.

The fertility of Kansas.—Sterling G. Cato, Territorial Judge, in a recent letter to his brot of Enfalta, Ala., says:

"The people here are quiet and orderly, sl and intelligent; a little rough in manners, warm hearts and cordial. This is as fine a cou as any on the face of the earth, and the profit its productions would far exceed those of the co fields of the South. All kinds of grain, gr clover, and hemp yield a rich product. I have doubt but that slave labour would yield in he corn and grain at least from thirty to forty dol per acre annually. I have seen no poor land all seems to me richer than the best Chattaboo bottom, and most of it is just such land as in adjoining Missouri counties is now selling at two to fifty dollars an acre. Corn is now selling twenty cents per bushel, and the product estima at one hundred bushels an acre: and hemp crop tons per hand) at $140 per ton, and you see at o how labour is more productive here than at the so

"It is impossible to give an adequate idea of beauty and fertility of the soil and country; gr rally rolling, without a great deal of timber, as I understand, abounding in coal for fires, stone for building and fencing; good wells of wa can be obtained anywhere, besides frequent stre running through the prairies."

"Be pitiful, be courteous."—1 Peter, iii. 5.

How many hearts are continually bleeding, fr wounds inflicted by incivility and rudeness. should be careful to avoid this; for religion gi no man release from the courtesies of life. In private intercourse with our brethren, we sho be anxious to give no offence. If we feel it duty at any time, as we may, and ought to ex postulate with a brother on the impropriety of conduct, we should be cautious to abstain from appearance of what is impertinently, officiously offensively blunt. Reproof, or even expostulat is rarely palatable, even when administered w the sweetness of christian kindness; but it wormwood and gall when mingled up with mor ness and severity. We must never think of ing the part of a reprover, till we have put humility as a garment, and taken up the law kindness in our lips.—*J. A. James.*

From the Christian Advocate and Journal.

The Cinchona Tree.

h those lofty regions, the Andes of South Ame-
, are found some of the richest productions of
whole world. Here are the mines of quick-
r, tin, gold, and silver, with rubies, precious
es, and diamonds; and here too are found drugs
valuable woods, and especially the Cinchona
, from which is extracted the celebrated *Qui-*
. The gathering of this bark is free to all.
t from the trunk "*Tabla*" is the best; the
arque," or larger branches, is of second qua-
; while the "*Canulo,*" or upper and smaller
s, is the poorest.

workman can cut two quintals a day which,
d and ready for market, yields one quintal, or
hundred pounds. At the stump of the tree
woodman will dispose of his bark at $8 or $10
quintal. It is a strange law of the country
all the Cinchona bark gathered in Bolivia
first be sold to chartered companies, who mo-
lize the traffic. The article has to be carried
ss the Andes, and delivered at La Paz or
abamba, where the banks are established for
urchase. $60 are paid per quintal for the
quality, $35 for the second and poorest.
n the government imposes a tax of $25 per
tal on the best, and $18 for the other qualities,
ch the banks have to pay.

he bark is packed in bales, weighing 150 pounds
, and covered with raw-hide: two of these
e a mule-load across the Cordilleras to the port
Arica, on the Pacific. This journey consumes
days from La Paz, the bank paying $12 for a
e load; so that the bark landed at this port
s the purchasers $89 for a quintal.

t Arica, the usual price of the Cinchona is
s $50 to $150 the quintal, depending altogether
n the foreign demand. Shipped and conveyed
nd Cape Horn, the chemists of our own country
of Europe manufacture it into Quinine, and,
ded, the valuable powder is re-shipped, and
again at Arica, in its new, concentrated form,
he apothecaries. Purchasers carry it into the
rior for sale, where it is esteemed a specific
he treatment and cure of certain fevers? and
Cinchona woodman pays, where he stripped
tree, for a single ounce of *Quinine*, the same
e he sold one quintal of the bark from which
made.

h all civilized countries the use of Quinine has
me common, and 10,000 pounds are supposed
e a small estimate of the quantity annually
umed. The bank at La Paz has received 14,-
quintals per annum; and the government of
via, by a public decree, forbid the gathering
he bark for two years, from January, 1852,
1854. We have imported from Europe into
United States as much as $200,000 worth of
bate of quinine in a single year.

he Arricos have hard work, even with their
ted mules, to reach the Pacific, carrying heavy
s of Cinchona, having to ascend and cross two
ges of the Cordilleras. Here the article finds
chasers for shipment.

Jesuit's bark," as the Cinchona was formerly
d, has been known a long while for its medi-
l qualities, but was never gathered into quan-
s until 1849. In 1851 the bank to purchase
bark was established at Cochabamba. The
ers in La Paz not liking this movement of a
nd company or monopoly in the trade, the
ves bark was first to have its quality determined,
n the La Paz bank pronounced it bad, in op-
tion to the opinion of the merchants of Lima
Valparaiso. A shrewd, cunning merchant of
abamba requested his agent in La Paz to send
a quintal of their bark, which had passed the inspection of the bank there. This was unpacked, and made up in the Cochabamba fashion, and sent back, when the bank declared their own article not to be good. The case was forthwith laid before the government, a new company granted, and its bank established, in 1851, at Cochabamba.

The Cinchona trees of Bolivia are found in a lonely, uninhabited region on the east side of the Andes, 10,000 feet above the ocean, forming a sort of belt along the sides of the mountains, and stretching from half way down to their feet. They present a beautiful leaf which is clearly distinguished from the other foliage, and are in location about 22 deg. south latitude, and 10 deg. north latitude. In Bolivia it is thought that the Cinchona forests are giving out. The only way to save the valuable tree is to take the bark off in strips, and not cut it down; then it would have the chance of a new coating. This method would do more to save the Cinchona than all the royal edicts forbidding its destruction. When once cut down it requires the time of a man's life for a young shoot to reach full size. A truly valuable tree, planted in mercy to man by our bountiful Creator. Great care and protection, wherever it grows, should be given to its preservation.

As before stated, the forests are open to all, and the getting Cinchona is thought to be more profitable than mining. This region of Bolivia has its rainy season, and many woodmen sacrifice their lives from sickness, caused by remaining in the forests after this period. Thus they perish, while seeking fortunes, in obtaining the very article that saves myriads from the grave. It is a singular fact that the native Indian population pay little attention to this traffic; and it is said there is a bark found in the province of Matto Grasso, which they prefer, and use in cases of fever and ague. They consider it a specific, a certain cure for the disease, but not yet known as an article of trade.

By whom the medicinal qualities of this tree were first discovered is not known. Humboldt states that the Jesuit missionaries probably earliest became acquainted with them, and derived much wealth from its sale. In 1640 the Spaniards introduced the Jesuits' bark into Europe.

On the quickness with which the bark is dried depends its price. Hence the green bundles are despatched as rapidly as possible from the forests to some open place, for the full action of the sun. A few hours' dew turns it black, and will lessen its value one-half.

Travellers heretofore have known but little of those lofty South American forests where the Cinchona grows, and we are chiefly indebted to Lieut. Herndon, of the United States army, for our present knowledge on the subject. It is contained in his Report to Congress on the Exploration of the River Amazon, an arduous journey, which he has recently and successfully accomplished by order of our government. G. P. D.

The Clove, October, 1855.

Gypsum as a manure.—Experience seems to have established, in reference to the use of plaster, the following conclusions: It has little or no effect in a marine atmosphere, or upon low and moist lands: it is peculiarly adapted to light warm soils; when used upon tilled ground, it should be plowed in, or mingled with the earth by the harrow or hoe; it may, however, be strewed upon corn, potatoes or beans, immediately after hoeing; its effects are much more decided upon tilled land, when the turf or dressing of manure has been plowed in; when a clover crop has been turned under, the fertilizing influence of that crop is much enhanced by an application of plaster immediately preceding the plowing.

Natural Affection.

Natural affection needs a careful examination; operating upon us in a soft manner, it kindles desires of love and tenderness, and there is danger of taking it for something higher. To me, it appears an instinct like that which inferior creatures have: each of them, we see, by the ties of nature, love self best; that which is a part of self, they love by the same tie or instinct. In them it in some measure, does the offices of reason, by which among other things, they watchfully keep, and orderly feed their helpless offspring. Thus, natural affection appears to be a branch of self-love, good in the animal race, in us likewise, *with proper limitations*, but otherwise is productive of evil, by exciting desires to promote some, by means prejudicial to others. Our blessed Saviour seems to give a check to this irregular fondness in nature, and at the same time a precedent for us: "Who is my mother, and who are my brethren?" thereby intimating, that the earthly ties of relationship, are, comparatively inconsiderable to such, who through a steady course of obedience, have come to the happy experience of the Spirit of God bearing witness with their spirits, that they are His children. "And he stretched forth his hands towards his disciples, and said, Behold my mother and my brethern: For whosoever shall do the will of my Father who is in heaven" (arrives at the more noble part of true relationship) "the same is my brother, and sister, and mother." This doctrine agrees well with a state truly complete, where love necessarily operates according to the agreeableness of things on principles unalterable, and in themselves perfect. If endeavouring to have my children eminent amongst men after my death, be that which no reasons grounded on those principles can be be brought to support; then to be temperate in my pursuit after gain, and to keep always within the bounds of those principles, is an indispensable duty, and to depart from it a dark unfruitful toil. In our present condition, to love our children is needful; but except this love proceeds from the true heavenly principle which sees beyond earthly treasures, it will rather be injurious than of any real advantage to them: where the fountain is corrupt, the streams must necessarily be impure.—*J. Woolman.*

Scaling Turtles.—The tortoise shell of commerce is merely the scales that cover the bony shield of the turtle. These scales are 13 in number, varying from an eighth to a quarter of an inch in thickness. A large turtle will furnish about eight pounds. To detach this shell from the living animal is a cruel process, which it made my flesh creep to witness. The fishers do not kill the turtle; did they do so, they in a few years would exterminate them. When the turtle is caught they fasten him, and cover his back with dry leaves or grass, to which they set fire. The heat causes the plates to separate at their joints. A large knife is then carefully inserted horizontally beneath them, and the laminæ lifted from the back, care being taken not to injure the shell by too much heat, nor to force it off until the heat has fully prepared it for separation. Many turtles die under this cruel operation, but instances are numerous in which they have been caught a second time, with the outer coating reproduced; but in such cases, instead of 13 pieces, it is a single piece.—*Brad's Adventures on the Mosquito Shore.*

The business in which we cannot ask the protection and assistance of God, cannot be an innocent pursuit; the amusement for which we dare not thank him, cannot be an innocent pleasure.

For "The Friend."

Early Anti-Slavery Advocates.

BENJAMIN LAY.

(Continued from page 212.)

The Yearly Meeting held at Philadelphia, in the Seventh month, 1737, by minute, repeats its "advice and caution against encouraging the importation of negroes, by buying them after imported, and recommends it to the several Quarterly Meetings belonging to this meeting, not only to be careful in the verge of their respective meetings in this particular, but to return an account thereof to the next Yearly Meeting." In accordance with this direction, the next year it was presented with reports on the subject. Philadelphia Quarter does not find "that many, if any, Friends are chargeable with breach of the Yearly Meeting direction." Chester, "that Friends, in the verge of their respective meetings, have been careful to observe" 'the advice and caution of last Yearly Meeting.'" Burlington finds Friends within their limits "mostly clear." Gloucester and Salem also report mostly clear. Shrewsbury states its belief that "there has been but a very few, if any, bought amongst us for some years." Great satisfaction was expressed by many honest Friends at the Yearly Meeting to find that the subordinate meetings could give such clear reports, and the subject was again sent down to Quarterly and Monthly Meetings to continue their care on this subject. This was all very well to those who were disposed to be thankful for every step of the Yearly Meeting in the right direction, however small, but it did not satisfy Benjamin Lay, so long as Friends who bought slaves, or imported them, were not immediately disowned. He would have had all disowned, who still retained their slaves, if they did not evidence that they were, by education, preparing them to be set free.

The Yearly Meeting this year, (1738), was held at Burlington. Thither our eccentric philanthropist went to carry out a whim which he had conceived, and which he thought might make an impression on the company assembled. He was there over First and Second-day, and on Third day morning, Seventh mo. 19th, he enacted the scene according to his intention. He had procured a bladder, full of a red fluid—some accounts say blood, others that it was poke-berry juice. This bladder he placed in the cover of a large book, from which the leaves had been taken, and a hole made through one side. Roberts Vaux's account says, "He then put on a military coat, and belted a small sword by his side. Over the whole of this dress he threw his great coat, which was made in the most simple manner, and secured it upon himself with a single button. Thus equipped, he entered the meeting-house, and placed himself in a conspicuous situation from which he addressed the audience in substance, as follows.

"Oh, all you, negro masters, who are contentedly holding your fellow-creatures in a state of slavery during life, well knowing the cruel sufferings these innocent captives undergo in their state of bondage, both in these North American colonies, and in the West India Islands; you must know they are not made slaves by any direct law, but are held by an arbitrary and self-interested custom, in which you participate. And especially you who profess *to do unto all men, as ye would they should do unto you*, and yet in direct opposition to every principle of reason, humanity, and religion, you are forcibly retaining your fellow men from one generation to another, in a state of unconditional servitude; you might as well throw off the plain coat as I do," [here he loosed the button, and the great coat falling behind him, his warlike appearance was exhibited to his astonished audience,] and proceeded, "It would be as justifiable in the sight of the Almighty, who beholds and respects all nations and colours of men with an equal regard, if you should thrust a sword through their hearts as I do through this book." He then drew his sword, and pierced the bladder, sprinkling its contents over those who sat near him. The above speech does not appear to be in the style of Benjamin Lay's writings, nor such as in the excitement of the moment he would be likely to use. John Forman, a minister of the last century, who appears to have been present at the Yearly Meeting in 1738, says that when he thrust his sword into the bladder, he declared that "so the sword would be sheathed in the bowels of the nation, if they did not leave off oppressing the negroes."

I have in my possession a paper, describing the scene, evidently in the handwriting of John Kinsey, the clerk of the Yearly Meeting, written on the day when it occurred. If the account had been completed, no other would have been necessary. It bears date Seventh month 19th, 1738, and runs thus,—

"One Benjamin Lay, a little whimsical fellow, having wrote a book against keeping of negroes, highly reflecting on Friends for so doing, this day appeared in the Yearly Meeting, and with his back to the gallery fronting the people, with a sword, or tuck in his hand stood, fixed like a statue the whole time. When the meeting broke up, he threw off his coat, and with a loud voice signified that so those who wore plain coats, and kept slaves, should be served. He then took the book,* already prepared with a hole made through it, and as was supposed, a bladder containing blood placed against the hole. Through the book and bladder, [he thrust his sword,] and made the blood sprinkle about, declaring that it was by such cruel practices the negroes were brought from their own country, &c., [inquire the words.] He had been there some days, and during the whole time, declared his food was acorns and peaches only."

The attention of the Yearly Meeting being drawn to Benjamin Lay and his book, John Kinsey was directed to draw up an advertisement for insertion in the newspapers, exonerating the Society of Friends from any responsibility relative to his book or actions. In pursuance of the directions given, John Kinsey had the following inserted for a few weeks in the "American Weekly Mercury" and the "Pennsylvania Gazette."

"It is now some months since a book was published in this city with the title of 'All slaveholders Apostates,' in the preface to which are these words, viz. 'These things following are so far from offending or grieving my very dear Friends called Quakers, who love the Truth more than all, that it is by their request, and desire that they are made public.' From which paragraph it is not improbable some readers may be persuaded to believe the author was one of the people called Quakers, and that his book had been printed at their request, especially were they to be altogether silent on the occasion. Therefore, they have thought fit, and hereby do give public notice, that the book aforesaid contains gross abuse, not only against some of their members in particular, but against the whole Society; that the author is not of their religious community; that they disapprove of his conduct, the composition and printing of his book; and, therefore, are not to be accountable for its contents.

By order of the Yearly Meeting, &c.,
JOHN KINSEY, Clerk."

His eccentricity was not confined to acts, bearing testimony against slavery. John Forman used to relate what he saw Benjamin do, by way, as he supposed, of a testimony against smoking toba He came into a meeting for worship, during holding of the Yearly Meeting, with three l tobacco pipes stuck in his bosom, and took a on the steps between the galleries where the and women ministers and elders sat. When thought the meeting was about over, he rose dashed one pipe among the men ministers, among the women ministers, and the third am the congregation assembled. It does not ap that he said anything, but by the act merely w ed to imply that they were men and women o classes, guilty of the sin of smoking.

Beside this testimony against smoking, he another against drinking tea. This probably a from an idea, that tea was a luxury, causing expenditure of much money, and producing li good. His wife had been probably a tea drink and when Benjamin thought it necessary to b a public testimony against the practice, he had tea service to begin with. Taking the cups to market-place in Philadelphia, he commenced bre ing them to pieces. A number of boys gathe round, and one, a stout youth, stepping beh the light little man, adroitly slipped his head tween his legs, and suddenly rising, lifted him and carried him off, whilst the other boys sa the balance of the tea-set from destruction, taking them away.

(To be continued.)

* Probably, a copy of his own.

Selected.

It is our comfort while we are obnoxious to many accidents of life, that we are under the c of one who directs contingencies, and has in hands the management of everything that is ca ble of annoying or offending us; who knows assistance we stand in need of, and is always re to bestow it on those who ask it of him. The tural homage which such a creature bears to infinitely wise and good a Being, is a firm relia on him for the blessings and conveniences of l and an habitual trust in him for deliverance ou all such dangers and difficulties as may befal The man who always lives in this disposition mind, has not the same dark and melancholy vie of human nature, as he who considers himself strictedly from this relation to the Supreme Bei At the same time that he reflects upon his o weakness and imperfection, he comforts him with the contemplation of those divine attribu which are employed for his safety and welfi He finds his want of foresight made up by Omniscience of Him who is his support. He not sensible of his own want of strength, when knows that his Helper is almighty. In short, person who has a firm trust on the Supreme Bei is powerful in His power, wise by His wisdo happy by His happiness. He reaps the benefit every divine attribute, and loses his own insi ciency, in the fulness of infinite perfection.—*Addison.*

Cost of books among the Ancients.—What immense reduction has been made in the price books by the invention of the art of printing. is recorded of Plato, that although his pater inheritance was small, he bought three books Phylolaus the Pythagorean for ten thousand narii nearly $1500. We are also informed t Aristotle bought a few books belonging to Sp cippus the philosopher, for three attic talent sum equivalent to about $2,800. St Jerome, a ruined himself by purchasing the works of Orig

"Always remember that you are in the mi of temptations and never more so than when n pleased with outward objects and intercourse.'

The *Novel*, strictly so called, is substantially moral. Of the class, *as a whole*, it is easy to ve that their tendency is not *good*. They are er the handmaids of vital godliness; and even h of them as claim to be the pleaders of mora- , miserably fail of their object, and *often* stul- or destroy the special virtue which they pre- d to exalt and protect. * * They uniformly e false impressions and views of life, and com- sion their devourers into this plain matter-of- world, to be victims of disappointment or ctacles of indecision. They help to make and eep *thousands* among the silliest and most less of mankind and womankind. They con- ne, for the most ignoble of ends, hours and years precious time, never to be redeemed. They are proper and peculiar food of worldly minds, and ecule the plain and wholesome nourishment ich soberminedness requires. They are sad lers to the fervency of devotion * * There er was an eminently pious man a novel reader. *Selected from "The Narrative of A. M. Macfar- e of Scotland."*

Epistle of George Fox.

My dear Friends,—Keep your first love in the th, power, and Seed of life in Christ Jesus; for s last night, as I was lying in my bed at Amster- n, I had a great travail in the holy Seed of life peace, and my spirit was troubled with that rit of strife and separation. I saw it was a troying spirit, and did speak not only to get over Seed, but to destroy it, and to cat out the minds he people from it by strife and contention; and, ler pretence of standing for the ancient truth, work is to root it out, and destroy the appear- e of it, to set up itself. It is a creeping spirit, king whom it can get into; and what it cannot itself, it stirreth up others to do, and setteth ir spirits afloat with the dark wisdom to des- y the simple. This spirit is managed by the nce of the air, and leadeth some to do things ich they would have been ashamed to have done nen, which doth unman them; and they would have suffered them, if they had kept to the der principle of God, which leadeth to peace. s a despising, back-biting, secret, whispering rit, a sower of dissension, and a taker of advan- e of all prejudiced spirits, that are disobedient their first principle, and love of truth, and 'etteth into hatred; so it begetteth all into that rit, whose work is to destroy both the good hin and the good order without. Nay, it would t could, destroy the government of Christ, and order of the gospel to set up its own will and rit, which is not of God; and, under pretence crying down man, is setting up man and gather- into a separation of disobedient men, who float ve their conditions. This spirit which neither eth in the truth, nor its order, but opposeth m that do, I cannot express it, as I see it and work, whose end will be accordingly. There- e, Friends, I am to warn you all that have not t your simplicity, not to touch it, nor to have y unity with it, lest you be defiled, and lose your rnal estate, and everlasting portion; and that r inward man, which is after God, may be pre- ved, and Christ may reign in all your hearts. will be very hard for those that are joined with m, ever to come down to truth in themselves, see their own conditions, and to have that spirit strife and contention (which eateth as a canker) ought down in them; which is carnal and slay- the tender babe which was once begotten in mselves. The Philistine is got up in them, t stoppeth the wells and springs, maketh a great stle, and is crying up men, and pleading for them, tead of Christ. So, Friends, strive not with them, but let those take them that cry them up. Keep you to the Lord Jesus Christ, with his light, that cometh from him, that he may be your Lord; and ye in him may be all in unity, in one light, life, power, and dominion in Christ your head. The God of peace, and power preserve you all in Christ Jesus, your Saviour; and out of and from that mischievous spirit which is idle and slothful, as to the work of the power, and Spirit, and light of God, and Christ. Its very act worketh strife and disturbance against the peace of the Church of Christ. It thinks, in its wilfulness, stubbornness, and unruliness, to set up itself, and in that to have peace; but destruction will be the end of it, and it is sealed for the fire and eternal judgment. Therefore let Christ, the Seed, be the head and crown of every one of you, that nothing may be between you and the Lord God. Be not deceived with vain, feigned or rough words; for Satan is transforming himself as an angel of light to deceive; but God's foundation standeth sure, and God knoweth who are his, and will preserve them upon the rock and foundation of life, in his peaceable truth and habitation, that in the same they may grow. Keep out of strife and contention with it, after ye have borne your testimony in the Lord's power and truth against it, then keep in the truth; for it hath a life in scribbling, strife, and jangling, because it would enlarge itself, and bring others into its misery with the airy power, and would get power over the good, disjoin people from it, and so commit rapes upon the simplicity by its subtility. But I do believe the Lord will defend his people, though he may try them and exercise them with this spirit for a time, as he hath done in days past, in other vessels it hath made use of, as it doth of these now, who have a more seeming fair outside, but foul, rough and rugged enough, within, against the Seed of Christ as ever were the Pharisees to destroy it. They, under a pretence of preaching Christ, are destroyers and crucifiers of him, and killers of the just, not only in themselves, but are endeavouring with all their might, to destroy it in others, where it is born. Pharoah and Herod slay the young Jesus in the spirit, as the old did. I feel it worrying them. That is got up to be king, which knew not suffering Joseph. But God will plague him, and the Seed will have more rest, and be better entertained in Egypt than under Herod, into whom old Pharoah's spirit is entered. He that hath an ear to hear, let him hear; and an eye to see, let him see, how this spirit hath transformed in all ages against the just and righteous; but mark, what hath been its end? The Seed reigneth, glory to the Lord God over all for ever! His truth spreadeth, and Friends here are in unity and peace and of good report, answering the good, or that of God in people. My desires are, that all God's people may do the same in all places, that the Lord may be glorified in their bringing forth much fruit that is heavenly and spiritual.

Amen. G. F.

Amsterdam, the 25th of the Seventh mo., 1677.

The Largest Mill in the World.—The largest and most comprehensive mill in the world is the Pacific, at Lawrence, Mass. The floor surface of this immense structure is 16 acres. The largest mill in England is 11½ acres. There are now in operation 40,000 cotton spindles and 10,000 worsted spindles; and these are to be increased to 80,000 and 20,000 respectively. There are 1200 looms in operation, to be increased to 2,400. These, with 2000 persons produce 300,000 pieces of cloth per annum—one half de laines. The weekly consumption of cotton is 20,000 pounds, or 1,500,000 pounds per annum, and 500,000 pounds of wool. Once a month, the two thousand persons assemble at the cashier's office, where he pays out $50,000 to them for wages, appropriating to each one the exact amount she has earned.

Selected.

WE WOULD SEE JESUS.

We would see Jesus—for the shadows lengthen,
Across the little landscape of our life—
We would see Jesus—our weak faith to strengthen
For the last weariness—the final strife.

We would see Jesus—for life's hand hath rested,
With its dark touch upon both heart and brow;
And tho' our souls have many a billow breasted,
We see them rising in the distance now.

We would see Jesus—other lights are paling—
Which for long years we have rejoiced to see—
The blessings of our pilgrimage are failing—
We would not mourn them, for we go to thee.

We would see Jesus—yet the Spirit lingers,
Round the dear objects it has loved so long;
And earth from earth will scarce unclose her fingers,
Our love to Thee, makes not that love less strong.

We would see Jesus—sense is all too blinding,
And heaven appears too dim—too far away;
We would see thee to gain a sweet reminding
That Thou hast promised, our great debt to pay.

We would see Jesus—this is all we're needing,
Strength, joy and willingness, come with the light,
We would see Jesus, dying, risen, pleading,
Then welcome day, forever farewell—night.

Collieries on fire.—There are now four collieries on fire in various parts of the coal region. The first is at Coal Castle, the second at Tamaqua, the third at Beaver Meadow, and the fourth on the Mill Creek, between St. Clair and Port Carbon, in a colliery which belongs to Wallace and Rothermell, which has been unworkable for the last three weeks, though we are informed that the fire has been smouldering there for several years, and as yet, we believe, no steps have been taken to extinguish it—neither has any attempt been made, as far as we can learn, to extinguish the fire at Beaver Meadow. At Coal Castle, the "Burning Jugular," has for many years attracted attention and afforded paragraphs for the papers. The fire still smoulders in its vast caverns, beneath the Broad Mountain, but its progress is evidently slow, as the small quantity of atmospheric air that can penetrate through the thick strata of earth and ashes which cover it is not enough to support combustion; neither can it penetrate beneath the water-level, and its ravages have been and still are confined in a western direction. If the Jugular unites with the Mammoth, as it undoubtedly does, there may be reason to suppose that it will, in time, if not subdued or cut off, communicate with it—but the danger cannot be great, since the coal in that direction has been generally extracted above water-level.

There is every prospect of extinguishing the fire in the Tamaqua vein, notwithstanding public opinion to the contrary. The former unsuccessful attempt does not by any means render future attempts abortive. On the contrary, the result of the first trial was such as to warrant new efforts to extinguish it, and so complete are they now that there seems to be no chance for a second failure. The mode made use of by R. A. Maingy, which is the same as that used for the same purpose, with invariable success in the mines of Great Britain, will extinguish the most extensive fire, if properly brought in contact with it, as effectually as if the burning mass was plunged into the Pacific. The gas will be ejected into the burning mine, for two or three weeks longer, until the ignited body is entirely enveloped and saturated with it, and then the locality of the fire will be allowed to remain for two or three months, completely enclosed and

isolated from the atmosphere before being again opened. The damage sustained by the burning of the coal will be very small. The fire having fortunately originated in an old pillar, many hundreds of yards from the main body of coal above water level, and the cost of extinguishing it will be, for the object to be attained, comparatively trifling.—*Pottsville Miners' Journal.*

For "The Friend."

Happy Prospects.

No doubt all my readers know how exhilarating is a pleasant prospect; my young readers especially, and we have all been young, though years or sickness may now have worn off the enthusiasm of youth. For myself, I try to have always some pleasant prospect before me to stimulate me to industry, and to throw its sunlight over the hill-country through which life's pathway lies. Many a time when one or another care or thing to be done has weighed heavily upon me, I have laid some simple cheering plan to occupy the earliest leisure, and it would surprise me how quickly that leisure would come; and if the plan proved but an air-castle, who shall say the air-castle did no good? And even now when the spring shall open upon us, and the earth shall blossom, with the blue and gold of the skies, I have in prospect a long talked of journey, and the present is shaping itself accordingly, and listlessness and discouragement are dispelled by its hopeful rays.

But listlessness, and discouragement and disappointment, though neither easy nor agreeable, are among the trifling ills of life. There are great and heavy ones, to which no social plans are commensurate, which the "hope set before us" alone can brighten. And it was of the journey we have all to take, that I was thinking as I took up my pen—a journey so great and so wonderful that I marvel, it is not always in our thoughts. Its termination will open the eyes of the blind, give hearing to the deaf, and speech to the dumb. It will unfold the deepest mysteries; it will teach the sum of truth. If we are prepared for it, it will reveal to us such beauty and glory as even our hearts have not conceived; it will make all pain to cease, bring all doubt to an end, show to us the reason and the cause of all things!

There need be no fear of disappointment respecting this journey, therefore, my friends, let us keep it ever in view. How little will all other prospects seem with this glorious one kept constantly before us! How much of our thoughts will it occupy, and how diligently will we work that we may be ready by the time. And if we find that do all we can, we cannot of ourselves make ready for this journey, and we have a friend, who, we know, is willing and waiting to help us, how gladly and gratefully will we accept His aid! The Son of the King of that wonderful country to which our journey tends, will be to us such a friend. He will give to us the robe of His righteousness if we will deny ourselves, and let fall our own. He will clothe us with humility if we will cast off pride. He will give us the shield of faith, if we will renounce unbelief. He will gird on us the whole armor of God if we will throw down the armor of the creature. If we resist the promptings of our evil passions, by Him our feet will be shod with the preparation of the gospel of peace; and from Him we will receive for an helmet, the hope of salvation!

Thus equipped for the journey to joys unseen and full of glory, how great would be our solicitude lest contact with the world and the things of the world, should tarnish the fitting apparel granted us, to appear before the Sovereign of that glorious land. How we would shrink lest the pleasures of time should leave a stain, how rejoice if trial and crosses brighten our armor! How insignificant would be our temporal disappointments with this transcendant prospect before us! How cheerfully we could bear; how hopefully labour with an eye to this recompense of reward!

But without this sufficient attire, the glorious prospect and all the peace and contentment—all the hope and confidence and joy it bestows—must give place to doubt and dismay—to an uneasy consciousness present with us, that we are busy about, we know not what, that we are making friends with a thief and a robber, that all is vanity and vexation of spirit. And the prospect before us must be a fearful looking for of judgment and fiery indignation!

May we then work diligently with fear and trembling to gain possession of these faultless garments, have them in *daily wear*, and watch and pray lest an enemy steal them from us. Then assuredly we will be enabled in everything to "give thanks," to "rejoice in the Lord always," and in *all* trials and afflictions to look forward, believing they are but for a moment, and will work out for us a far more exceeding and eternal weight of glory!

F——, H——, Pa.

For "The Friend."

"My Light is gone Out."

This was the solemn and impressive language of one, who a few moments afterwards fell back in his chair and suddenly expired. The thread of his life was suddenly snapped, the poor frail tenement of clay returned to the earth from whence it came, and the immortal soul to God who gave it, there to receive the recompense of reward for the deeds done in the body. He was a man who had sought the honours and treasures of this world, and had not sought in vain. In seriously considering this circumstance and the solemn lesson it is calculated to impress upon our minds, I have remembered the language of our blessed Saviour, "What is a man profited, if he shall gain the *whole world*, and lose his own soul, or what shall a man give in exchange for his soul?" I well remember an old man, with whom I was intimately acquainted when a child, whose all-absorbing concern was, how he could make and save money, and when reminded of the uncertainty of time, and the awfulness of an endless eternity, he used to reply, that he hoped, just before his end, he would be enabled to commit his soul to the keeping of Jesus and he believed it would be well with him. And thus, day after day, and season after season, rolled away, until in advanced age, he was brought down upon a sick bed; here he lingered about five weeks, mostly wandering in his mind, and near the solemn close, instead of imploring the mercy and forgiveness of our blessed Redeemer, his last words were—*an awful curse.* Though young at the time, my thoughts still turn at seasons to the remembrance of the solemn considerations awakened in my heart, by his sorrowful end.

How many of us up and down, even in our favoured Society are practically putting off the great work of our soul's everlasting salvation, for a death-bed opportunity; are in effect saying, by and by, "at a more convenient season," we will prepare for these things. Let us remember it is emphatically declared, "my spirit shall not always strive with man;" and if we are resolved to go on pursuing the pleasures and treasures of this transitory world, and neglecting or putting off the all important concerns of our future welfare, "In a day when we look not for him," our master may call for us, saying, "Steward, give an account of thy stewardship, for thou mayst be no longer steward."

Then perhaps the language may be applicab
us, which was addressed to the rich man form
who had laid up "much goods for many yea
"Thou fool! this night thy soul shall be requ
of thee, then whose shall those things be, w
those hast provided?" What then would be

For "The Friend

Faith and Trust in the Lord.

In 1670, the British Parliament passed an
against seditious conventicles, designed to prev
Friends from holding their religious meetings, s
jecting them where five persons or more were
sent, to a fine of five shillings each, and two
pounds for a preacher, which the company w
liable to pay if the preacher had not the prop
to be distrained, or did not reside in the pl
Persecution followed the passing of the act to a v
severe degree. Many Friends were beaten w
swords and pikes and muskets, so that their bl
ran to the ground; and the informers were
eager in hunting their prey, that they repor
meetings where there were none. At Droitw
John Cartwright came to a Friend's house,
sitting down to supper prayed before they
which was heard by an informer, the room be
next to the street. He thereupon went imm
ately and informed that there was a meeting
that house, and obtained a warrant to distr
the goods, and when he came riding with them
the evening, he fell from his horse and broke
neck, thereby getting his death instead of the p
which he hunted after. Such a state of deprav
and blindness to the rights of religious persc
among a people having the opportunities of c
cation and possessing talents of a high grade
almost incredible. The principles and the sp
of the gospel have surely exerted a powerful
fluence since that period, as no such law could
enacted or enforced at this day, either in Gr
Britain or in this country. We often dwell u
the great wickedness and the want of truth,
justice and sincerity, conspicuously prevalent e
among many professing christians, besides the inf
lity in which hundreds are lost to all sense of the

religion; but we have need to be on our guard
just the insinuations of a false spirit, tempting
o believe that Satan will finally prevail, so as to
waste the kingdom of Christ in the earth. That
devil is permitted to use great power and to
ate divisions in church and state, by which he
ks to weaken the hands of righteous men, there
be no doubt. He is also striving to destroy
ir faith in the mercy and goodness of the Lord
ovah, and in the certainty that his power is
r all the powers of darkness, and that he will
nifest it to the exaltation of the kingdom of his
r Son, and to the unspeakable consolation of his
ldren, who mourn over the wickedness that is
the world.

t is one of the peculiar artifices of the evil one,
ile he lulls many into ease and indifference
but the cause of religion, to magnify in the view
onest souls, the trials and dangers of the day
which they live, tempting them to cast away
shield of faith, wherewith they have often
nched his fiery darts, that he may thereby pre-
l upon them to throw down their armor, and
ggle onward no longer. This is a powerfully
tting temptation, and particularly upon those
o have often proved in their prime, the com-
sionate regard of the Great Captain of salvation,
ivering them out of the hand of their cruel
my, and enabling them to put him to flight;
who, in the decline of their natural vigour of
ly and mind, and for their humiliation, experi-
e at times the spring of divine life seemingly to
m almost dried up, and are encompassed with
rs, that they shall be entirely deserted. In this
e they cannot always see the goodliness of the
ts of Jacob and the tabernacles of Israel, com-
able to the glory of Lebanon and the excellency
Carmel and Sharon, but conclude that in the pre-
t state of the church, the gold has become dim
t the fine gold so changed, that there are few
who steadily uphold the ark of the Lord's tes-
onies, and the order of the gospel, and that
se precious testimonies are in danger of falling
the ground.

But how much better for each one to keep his
turned to the Holy One of Israel, praying to
ve it afresh anointed to see his own condition;
at the Lord calls him to leave undone and to
and humbly and fervently asking Him for
ength to perform his will. When a host com-
sed the city in order to take the prophet, Elisha's
vant said, "Alas, my master, how shall we do?
d he answered, fear not, for they that be with
are more than they that be with them. And
sha prayed and said, Lord, I pray thee, open
eyes, that he may see. And the Lord opened
eyes of the young man; and he saw and behold
mountain was full of horses and chariots of fire
nd about Elisha. And when they came down
him, Elisha prayed unto the Lord and said,
ite this people, I pray thee, with blindness, and
smote them with blindness, according to the
rd of Elisha;" and thus their evil purpose was
eated. The Lord's hand is not shortened; nor
angel of his presence withdrawn from his
rch, and he can as easily defend it, as he de-
ered the prophet from his enemies at that day.
e need more of the faith, and the patience, and
steadfast obedience of the saints. For want
keeping the word of the Lord's patience, and
during the emptying, reducing dispensations of
inscrutable wisdom, many are not furnished
h the supplies of living faith which they would
erwise be favoured with. But where the Lord's
pensations are rightly abode under, he that
unds to heal again, renews the faith of his chil-
n, enables them *to trust in Him in whom is
rlasting strength*, and then he casts up the way
for them to walk in, and anoints them with
the unction from the Holy One, by which he
afresh qualifies them for his work.

George Fox was remarkable for sympathy with his suffering brethren, and from living experience, could testify to the power of the Grace of God to support and carry through, and give the victory over all temptation, and the afflictions to be endured for the Church. In the year 1655, he addressed them in this wise: "My dear Friends, in the power of the everlasting God which comprehends the power of darkness, and all the temptations in it, in that power of God dwell; which will keep and bring you to the Word which was in the beginning; which will keep you up to the life, and to feed upon the same over the power of darkness. In that ye will find strength, and feel dominion and life, and that will let you see over the tempter; and into that the tempter cannot come; for the power and truth, he is out of. In that life dwell, in which ye will know dominion. Therefore, let your faith be in the power, and over the weakness and temptations, and look not out at them; but look in the light and power of God, at the Lord's strength, which will be made perfect in your weakest state. Look at the Grace of God in all temptations, to bring your salvation, which is your teacher to teach you. When ye do look or hearken to the temptations, ye go from your teacher, the Grace of God, and so are darkened. The Grace of God is sufficient in all temptations, to lead out of them, and to keep over them."

Another epistle "to Friends to keep in the life, out of janglings," says, "Friends, stand faithful to your measures of the gift of God, which cometh from Him, who was before the world was made, that ye may stand over the world, and all the betraying spirits in it, that nothing may reign but life in you all. And keep out of janglings and parties, in that which is able to keep you above them all to God; and in that all wait. And the bustlings of the world keep out of, *in the covenant of peace with God.*

THE FRIEND.

THIRD MONTH 22, 1856.

We have received three communications on "Separations" in our religious Society; one from Maryland and one from N. England advocating them under certain circumstances, and one from Ohio disapproving of them as a means for maintaining or promoting the truth. The discussion of the subject in "The Friend," being unlikely to promote harmony, it is deemed better that it should not be continued. We mention this, that the writers may not think their productions treated with disrespect.

We insert on another page a review of the new edition of Hepworth Dixon's Life of William Penn, from the London Athenæum.

It is an account of the manner in which he meets the charges against William Penn, in the new volumes of Macaulay's History of England. Our readers, we think, will agree with us in thinking the refutation complete, as far as it goes. We shall insert the whole refutation, as soon as we receive the volume.

The London Leader, a well conducted weekly paper of the same politics with Macaulay, in noticing the work of Dixon, observes,—

"In this argument, Mr. Dixon has the advantage over Mr. Macaulay. He has concentrated his attention upon Penn. Mr. Macaulay has studied events and men in groups. Mr. Macaulay allows his rhetoric to escape his facts; Mr. Dixon tests every statement by a close and penetrating analysis. It would have been fortunate, had historians of every age been watched by critics as vigilant and as largely informed. We think that Mr. Macaulay is bound to modify his assertions, or to vindicate them by additional evidence. At the same time he may have judged from impressions produced by a multiplicity of the flying satires of the day, and as Mr. Dixon will acknowledge, it is impossible by an exact reference to justify an impression. From the facts that appear, however, and from the inferences they permit, the general case against Penn has failed.

"Mr. Dixon's biography of Penn occupies a permanent place in the library of historical memoirs. It has passed out of the courts of criticism. We have, therefore, restricted our notice to the mere preface, which deals with new aspects of an old topic. The narrative itself is a master-piece, pictorial, bright, and written with as much integrity as eloquence, and will increase in popularity, as the study of English personal history becomes more general."

SUMMARY OF EVENTS.

EUROPE.—The steamship Arabia brought Liverpool dates to the 1st inst. The Arabia encountered no ice on the passage.

The Peace Congress.—Three sessions of the Congress have been held in Paris, but the proceedings have not been suffered to transpire. The first meeting was held on the 25th ult., at which Count Walewski, the French Plenipotentiary, presided. After exchanging credentials, a written guarantee was signed by the members not to divulge the proceedings until the Conference closed its sessions. An armistice has been decided on, to continue until the end of the present month, which is, however, not to affect the blockade of the Baltic ports. Orders have been forwarded to the Allied Generals respecting the armistice. It is stated that Napoleon has intimated to the Generals and Admirals in Paris, that they probably will not be required to return to the Crimea. Leave of absence is now freely given to the officers on duty in the Crimea. The Allies are about to destroy the sunken ships in the harbour of Sebastopol by dropping heavy shells designed to explode beneath the water. Vienna advices state that Ismal Pacha succeeds Omar in the Asiatic command. Omar recently demanded from the Porte the appointment of Minister of War, and on his refusal resigned.

RUSSIA.—The Government has directed the immediate issue of treasury notes, amounting to 21,000,000 roubles. Large amounts of specie have been recently forwarded across the Prussian frontiers into St. Petersburg. Three thousand men were employed day and night in the construction of a triple row of piles across the Gulf of Finland, six miles from Cronstadt, behind which is the Russian steam fleet, consisting of 18 ships, 14 corvettes and 70 gunboats.

GREAT BRITAIN.—The latest intelligence from India states that the kingdom of Oude has been formally annexed to the British dominions. On the 27th ult., the Lord Mayor of London assembled a party at the Mansion House to meet the American Minister, prior to his return to the United States. Buchanan was not present, having been invited on the same day to dine with the Queen. The Lord Mayor made a speech, regretting Buchanan's absence, as the reception he would have met with from the representatives of the leading interests of England would have proved to him the absence of all unfriendly feelings with regard to America, and that the interests of commerce, peace, civilization and humanity were too powerful to permit a collision between the two countries. Similar feelings were expressed by other speakers, including Cobden and Earl Elgin.

Liverpool Market.—Cotton was unchanged in price; the sales of the week were 66,000 bales. Breadstuffs have declined. Philadelphia and Baltimore flour was quoted at 36*s.* a 37*s.* Western Canal, 34*s.* a 36*s.* Consols, 91¾ a 91¾.

JAPAN.—On the 14th ult., the schooner Page arrived at San Francisco, from Hakodadi, (Japan) whence she sailed First mo. 6th. On the 11th of Eleventh mo. last, at 10 o'clock, P. M., a violent earthquake occurred at Jeddo, which is reported to have destroyed 100,000 dwellings, 54 temples, and 30,000 of the inhabitants.

The horrors of the scene were increased by fires breaking out in thirty different parts of the city. The earth is said to have opened and closed over thousands of buildings with their occupants. The shock was severe at Simoda. The Japanese treaty with the French was not yet concluded. There had been 78 arrivals of ships at Hakodadi, since the port was opened to foreigners. The Bay of Hakodadi was covered with ice on the 2d of First mo., and the snow was three feet in depth in and around the town on the 6th of First mo. The Page brought a miscellaneous cargo from Japan, which, it was believed, would find a good market in San Francisco.

MEXICO.—The Mexican Congress met on the 17th ult., with eighty members in attendance. The opposition to the government of President Comonfort appeared to be subsiding. Revolts which had broken out at various points, had been quelled, and the whole country was undisturbed, except in Puebla. The priests are severely censured for their support of the revolutionists, who are endeavouring to throw Mexico again into anarchy. The pretext is, that the present government is inimical to the church.

NICARAGUA.—Walker is reported to have seized all the boats of the Nicaragua Transit Company. He has also annulled their charter, and granted a charter to a new company. His Commissioner to the Republic of Costa Rica was rejected by that Government. Guatemala and the other Central American States have formed an alliance, offensive and defensive, against the Nicaraguan Walker government, and were making ready to expel the invaders.

UNITED STATES.—*Congress.*—In both Houses the Kansas question has been discussed with much earnestness. A bill for the improvement of the Ohio river has been referred in the House of Representatives to a Select Committee A bill establishing a uniform rule of naturalization, and repealing the present laws, has been referred to the Committee on the Judiciary. A bill to remit and refund the duty on railroad iron, has been referred to the Committee of Ways and Means.

New Hampshire.—The Americans and Republicans carried the State at the election last week. They elected a majority in both branches of the Legislature.

Kansas.—The Free State officers elected under the new State organization in Kansas, were sworn in at Topeka on the 4th. In order to avoid any difficulty with the Federal Government, the Legislature will merely meet and elect two United States Senators, to complete their representation in Congress, and then desist from further proceedings until the State is admitted.

New Orleans.—On the 7th, the lower cotton press was destroyed by fire with most of its contents. Loss, $180,000.

California.—On the 15th ult., the people of San Francisco were alarmed by an earthquake of considerable violence. It occurred at 5.23 in the morning when most of the inhabitants were asleep, but they were generally roused from their slumbers, and great numbers of them rushed into the streets in extreme terror. The vibration was from N. E. to S. W., and the first movement of the earth was very sudden, causing the buildings to sway to and fro heavily; afterwards the vibrations were short and rapid. They were attended with a report resembling the discharge of distant artillery, but the noise was continuous, consisting of a deep, low rumbling sound. The walls and plastering of many houses were cracked, and in some instances the latter fell off, but no buildings were thrown down, or even seriously injured. At San Jose the shock was quite severe, but it does not appear to have been felt over the Sierra Nevada. Six persons had been heavily fined in San Francisco for keeping gambling-houses. Much surprise and indignation were felt in consequence of the appointment of a professional gambler, named McDuffie, to the post of U. S. Marshal for the Northern District of California. It was presumed the President must have been imposed upon by false representations. About thirty lives were lost by the explosion of the steamer Belle, in the Sacramento river on the 5th inst. The miners were said to be doing well. The melting of the snows on the mountain tops furnished them with the requisite supply of water for washing out. Captain Zerman and the party of Expeditionists who sailed from here in the Archibald Gracie and R. Adams to Lower California, have been captured by Gov. Blancarte, and sent to Mazatlan. The California farmers had nearly done sowing their wheat.

Virginia.—The House of Delegates of Virginia last week, having declared, in a preamble, that the Fugitive Slave Law is a nullity in the Northern States; as a fair deduction from the assumed case, they also declare that it is the duty of the Federal Government to make full compensation to the owner for the loss resulting from the escape of slaves into free territory.

New York.—Mortality last week, 434. The Chief of Police states the whole number of arrests for vagrancy and drunkenness for the last six months to be 25,091, being a large increase upon the previous six months. Houses are said to be in great request, and rents have advanced 30 per cent. from last year.

Philadelphia.—Mortality last week, 230. The expenditures on account of the public schools for the year ending Tenth mo. 1st, 1855, were $520,786. The number of pupils instructed in them, was 54,813—28,150 boys and 26,661 girls. The number of teachers was 935, of whom 854 were females. The city tax for the present year has been fixed at $1.90 on every hundred dollars assessed. Last year it was $1.50. One of the persons convicted of a violation of the law prohibiting the sale of liquors on the first day of the week, having brought the case before the Supreme Court, that tribunal has given its decision fully sustaining the law in question, and affirming its validity.

Frightful Disaster.—On the evening of the 15th inst., between eight and nine o'clock, the steam ferry boat New Jersey left Walnut street wharf for Camden, with passengers estimated at from 75 to 100 in number, most of whom were residents of Camden. The boat attempted to make the usual passage through the Wind-mill island canal, but this was found to be impracticable on account of the ice. It was then backed out and turned northward so as to cross the bar above the island. When nearly opposite Arch street, the boat was discovered to be on fire below deck, near the smoke stack. An attempt was then made to get to Arch street wharf, which was nearly successful, but the flames had progressed so rapidly, raging around the pilot house and the engine, that both engineer and pilot were driven from their posts before the wharf was quite reached. The boat being now unmanageable, was carried out by the flood tide, and drifted helplessly up the river, until she struck the wharf on the ledge. In order to escape the flames, most of the passengers threw themselves into the river—many of these were drowned; others were picked up by boats, or saved themselves by swimming to the shore or to vessels in the harbour. Some were burned to death. It is probable that about fifty persons of both sexes perished by this mournful catastrophe.

Miscellaneous.—Indemnity.—The Legislature of Kentucky at its recent session enacted a law making all the cities and towns of the State responsible to the owners, for property destroyed by mobs.

Railroad Disaster.—On the 10th inst., a terrible accident occurred on the Seaboard and Roanoke Railroad, near Margarettsville, and 16 miles from Weldon, N. C. At a point where the road is carried over tressel work, thirty feet high, the engine ran off, followed by the whole train. The cars immediately took fire, and were entirely consumed with a great quantity of valuable freight. Four persons perished in the flames, and a number of others were much injured.

Steamboat Collision.—On the 8th, a collision took place on the Ohio river, between the steamboats Henry Lewis and E. Howard, which caused the former to sink in three minutes, in twenty feet water. The H. Lewis had a full cargo for New Orleans. About twenty persons were drowned. Among the passengers were four of the Cincinnati fugitive slaves, including Margaret and her infant child. The slaves were on their way to Arkansas. The child was drowned, and the others saved. The wretched mother exhibited no other feeling than joy at the loss of her child.

The Population of Pittsburg, and the seven or eight boroughs which surround it, is set down at the present time at 122,626, being an increase of 55 per cent. in less than six years.

The First Ship Load.—Ship Vanguard has arrived at London with a cargo of rice, from Madagascar, being the first importation of the kind direct from that island.

Georgia Gold.—The editor of the Savannah News recently saw two nuggets of gold from the Parks Mine, in Columbia county, Ga. One of these masses of solid and pure gold weighs 1400, and the other 1031 dwts.

RECEIPTS.

Received from Asa Garretson, agt., O., for B. Michener, $4, vols. 28 and 29; from M. Atwater, N. Y., for Mary Brownell, $1, to 27, vol. 29, for E. T. Weaver, $3, to 27, vol. 29; from C. Bracken, agt., O., for J. Hirst, Abm. Packer, $2 each, vol. 29, for Saml. Fisher, $2, to 23, vol. 30, for Isaac Mitchel, $4, vols. 28 and 29; from Lewis Forsythe, Del., $2, to 23, vol. 30.

TRACT ASSOCIATION.

The annual meeting of the Tract Association of Friends, will be held in the Committee-room on Arch street, at 8 o'clock of the evening of the 26th instant.

Those interested in the object of the Association are invited to attend. NATHAN KITE,
Philad., Third mo. 19th, 1855. Clerk.

WEST-TOWN BOARDING-SCHOOL.

The Winter Session of the School will close on the 11th of Fourth month, and *not on the 4th, as was heretofore stated in the late notice.*

The Summer Session will commence on Second-day, the 12th of Fifth month.

Application for admission must be made to John Snowdon, Superintendent at the school, or to John Scattergood, Treasurer, No. 84 Arch street, Philadelphia.

West-town, Third mo. 3d, 1856.

"A concise account of the Religious Society of Friends, commonly called Quakers, embracing a sketch of their christian doctrines and practices."—pp. 136.

This little book is designed to present to inquirers both within and without the pale of the Society, a condensed view of the principles and testimonies of Friends. It contains a sketch of the rise, organization and discipline of the Society, of its belief in the fundamental doctrines of Christianity, its views on worship, ministry, prayer, war, oaths, public fasts, slavery, trade, business, simplicity of apparel, the plain language, disuse of compliments, names of the months and days of the week, moderation and plainness in living, amusements, reading and music.

It is for sale at Friends' Bookstore, 84 Arch street, and Uriah Hunt & Sons, No. 44 N. Fourth street.

WANTED.

A suitable Friend and wife, to superintend the school and manage the farm belonging to Adrian Quarterly Meeting, Michigan. Apply to Richard Harkness, Adrian, or Samuel Satterthwaite, Tecumsey, Mich.

Friends' Boarding-School for Indian Children, at Tunessassah.

A man Friend is wanted to aid in carrying out the concern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTON,
377 S. Second street,
THOMAS EVANS,
Philad., Eleventh mo. 1st, 1855. 180 Arch street.

DIED, at his residence in Stanford, Dutchess county, N. Y., the 27th of Eleventh month last, STEPHEN UPTON, in the 74th year of his age. He was a member of Stanford Monthly Meeting, and an upright faithful elder many years. He was one of the first to detect and explore the unsoundness of Elias Hicks, and in subsequent years, when writings were circulated in the Society calling in question the soundness of some of the doctrinal views of our worthy ancient Friends, he was equally vigilant and discriminating, and bore a decided testimony against them; expressing near his close, that it was a great comfort to him *then*, that he had invariably done so. His end was peaceful, and his friends have the comforting assurance, that the Master who he endeavoured to serve, seeing his day's work was finished, has in great mercy gathered him to his everlasting reward.

——, at Someston, Belmont county, Ohio, 22d of First mo. last, after an illness of three weeks, EDMUND GIBBS, son of Joseph and Peninah Gibbins, aged thirteen years. Whilst in health, he spent most of his leisure time in reading "Piety Promoted" and other books of a similar character. When brought to a bed of sickness, he was anxiously concerned for the future, and when informed that it was not probable he would recover, he was much affected, and expressed a desire to live, but said if it was the Lord's will, he was resigned. He observed, "I have been too light and airy, but it is a great satisfaction that I have been preserved from using profane language," and expressed a desire, should he "dear Lord spare" him, to be more diligent in the attendance of meetings. He was repeatedly engaged in supplication, and a short time before his close, he bade those around him affectionately farewell, saying he was willing to die, and there was nothing in the way. His articulation became too indistinct, for all that he said to be understood, but the closing sentence was audible: "O Lord, receive my spirit, blessed and adored be thy name forever and forevermore. Amen."

Moreover, woods shelter the d beneath, and materially retard the evapo- of the water that falls as rain; consequently, rings are kept flowing, rivers do not dry up, he lowland cultivator can always depend on istant hills for the means of irrigating his

e question once started, became of too much tance to be slighted—great interests were ed in it. Most people remembered to have something about the prodigious waste of r by enterprising Yankees in their advance West; but at the same time a notion pre- that to clear the land was a public and pri- enefit. And now and then a grumble went und of the papers about the mismanagement Woods and Forests; but this was a new f the matter. Could it be true that the ts of civilization were in such a dilemma? cut down the forests, we deprive ourselves l and water; if we do not cut them down, all we obtain corn-fields?

ts were called for, and were from time to ublished in the scientific journals. The re- ns concerning forests that prevailed on the ent, were shown to have reference to the which had been signalized. The British ation had a report on the subject at their h meeting in 1851, embodying a large t of highly valuable information.

ar as this information goes, it confirms the thrown out by Humboldt. It is interesting e respects than those immediately concern- we hope to show before finishing our article. alley of Aragua, in South America, affords rkable example of increase and decrease of rresponding with increase and decrease of

'It is completely enclosed by high ranges giving rise to various streams and rivulets, the waters of which form a lake at the extreme end of the valley. The lake has no exit, and its superfluous waters are carried off by evaporation. Between 1555, when it was described by Oviedo, and 1800, when it was visited by Humboldt, the lake had sunk five or six feet, and had receded several miles from its former shores; the portion of the basin thus left dry appearing the most fertile land in the neighbourhood. These effects were ascribed by the eminent traveller to the destruction of the trees on the mountain. When the war of liberation broke out, agriculture was neglected, and the wood from the hills being no longer required by human industry, a great jungle began to prevail over all. The result was, that within twenty years, not only had the lake ceased to subside, but began once more to rise and threaten the country with general inundation.' Other cases precisely similar might be cited; but we take one in which there were means for measuring the alterations. At Marmato, a mining district amid dense forests in the province of Popayan, a decrease of the streams that drove the stamping-mills was observed, proportionate to the clearing of the woods. The mills served as gauges, and gave pretty accurate measures of the diminution, which went on to such an extent that, at the end of two years, there was an anxious cry: What shall we do for water? The defect was the more unaccountable, as the fall of rain had not diminished. The clearing, though sufficient to cause a local disturbance, had not affected the general climate. By way of experiment, the cutting down of the woods was stopped: and gradually the rivers resumed their former flow. In the tropics, this result would naturally be produced more rapidly than in northerly latitudes: the quick-growing vegetation sheltered the soil, checked evaporation, and the surface-water, retarded in its flow, found its way slowly and steadily to the beds of the streams.

The same thing has been noticed around Rio Janeiro: the terrible droughts which at times afflict the Cape de Verd Islands are attributed to loss of wood; and in Madeira, a change of climate has been observed since the island was first discovered, from the same cause. There is less humidity than formerly. The Socorridos, the largest river, was at one time deep enough to float timber to the sea; while now, except in occasional floods, it is a mere rivulet, scarcely discernible in its loose stony bed. The soil of Madeira is so light and porous, that it speedily suffers from deprivation of moisture. The fact was early noticed, and a law was passed forbidding the cutting down of trees near a spring or source of a stream; but as Portuguese laws are too often disobeyed, the evil has gone on increasing. The foliage is of a nature to favour a large deposit of dew; so large, indeed, as to keep the ground underneath constantly moist. Thus, the trees become condensers between the atmosphere and the earth. The well-known trees on Ferro, one of the Canaries, present undoubted evidence as to the condensing function. They are always wrapped in a cloud, from which they so rapidly and effectually draw off the moisture, that a continuous stream flows down the stem into reservoirs made to receive it. They are perennial fountains for the inhabitants, who prize them highly.

Every one has heard of the destruction of trees in the Spice Islands by the Dutch, who, to increase the value of their monopoly, cut down nearly all the spice-bearing woods, and thereby converted the islands into deserts: even now, those once luxuriant ocean-ringed oases have not recovered from the effects of such wicked waste. At Penang, the Chinese settlers make such reckless havoc in the clearings, that the English governor has prohibited any further cutting down of trees on the hill-slopes. These slopes are too steep for permanent cultivation, and the Chinaman was content to get one crop from the virgin soil, and then clear another spot; but this short-sighted process is happily checked. Besides the effect on the climate, the trees preserve the soil on the abrupt declivities from being washed away. To come to Europe: springs that once flowed in the highlands of Greece, have disappeared since the trees were cut down that formerly sheltered them. 'In Switzerland,' says Dr. Balfour, 'it has been perfectly ascertained, that rivulets formerly full have shrunk or dried up coincidently with the denudation of the mountains, and that they have once more returned to their former size on the woods being restored.' It appears to be certain that the planting of trees on the slopes of the French Alps has prevented the occurrence of the 'torrential floods' that once devastated the lower valleys. We may add, but without attaching any importance to it, that Pliny mentions the occurrence of contrary instances, where, by the cutting down of trees, the water that had nourished their roots bubbled up to the surface in springs. Cassander's troops, he remarks, were struck by those outbursts while felling timber for their intrenchments on the Balkans.

Another consideration presents itself: besides the dearth of fuel and water, consequent on the decrease of forests, there are the danger and destruction from torrents and floods that follow as a natural consequence. As Humboldt says: 'The beds of the rivers, remaining dry during a part of the year, are converted into torrents whenever great rains fall on the heights. The sward and moss disappearing with the brushwood from the sides of the mountain, the waters falling in rain are no longer impeded in their course; and instead of slowly augmenting the level of the rivers by progressive filtration, they furrow during heavy showers the sides of the hills, bear down the loosened soil, and form those sudden inundations that devastate the country.'

Clearly, civilization and nature do not always go hand in hand in the promotion of social interests, as we may see in our own highly cultivated country. Forests we have none to speak of; but improved drainage is attended at times with consequences such as are mentioned above. The rain-water, instead of lingering on the fields and in the ditches, now runs off so rapidly that the rivers cannot discharge quickly enough, and the consequence is an inundation. In some places, there are ten floods now for one formerly. The farmers on the levels of the eastern counties of England can tell of how many times their hay has been drowned in the course of a single season. But to return to the

forests. In St. Helena, the quantity of wood has been considerably increased of late years by planting; and, as careful observation shows, the quantity of rain has increased—almost doubled since the great Napoleon was a prisoner at Longwood. And now the destructive floods, which used to follow every storm, have entirely ceased. In 1849, there had not been one for nine years; nor have we heard of any since. In the neighbouring island of Ascension, as the report states, 'a beautiful spring, situated at the foot of a woody mountain, was observed to diminish in flow as the trees were cut down, and to vanish altogether when the wood disappeared. After a few years, during which no water flowed, the mountain became wooded again; the stream began to run, and, as the vegetation increased, resumed its former volume.'

We have abundant evidence of a similar kind from India—a country where the phenomena occur on the grandest scale. The average yearly rainfall along the shores of Hindostan is from sixty to eighty inches; but in the interior, at elevations 2000 to 4500 feet above the sea, it amounts to 200 inches. On the great plateau, however, and in places scant of trees, the fall is not more than from ten to thirty-five inches. The change is not gradual, but sudden: of little wood, you may safely predicate little rain. Humboldt mentions the great plain he travelled over between the Andes and the Orinoco, as extremely arid and desert-like, though, according to the early settlers, it was once well watered and sprinkled with forests.

Scarce as wood is in some parts of India, it is so abundant in others, that any recommendation in favour of economy is treated with a laugh. Protect the forests, indeed! Let us take a glance at what goes on in the magnificent teak-forests of Tenasserim and Malabar. The Parsee merchants go with the wood-cutters, and chop down spars of from five to nine inches diameter, and seventy-five feet long, without regard to the future condition of the woods, and with so little regard to the demand, that one observer saw hundreds of these spars rotting on the beach. In the Canara forests, the jungle-people 'girdle' the largest, as the Americans call it, and set fire to the rest; and then, without stirring the soil, sow millet or castor-oil among the blackened stumps; and after taking one or two crops, repeat the process in another spot. Thousands on thousands of acres have been destroyed in this way. 'Far as the eye can reach,' says Superintendent Onslow, 'not a tree is to be seen. It may be supposed,' he continues, 'that clearing the forest would make the country more healthy; and so it would, if the clearing were more permanent: but the forest is now destroyed only to be replaced by a thick jungle of rank vegetation, still more unhealthy,' as it impedes the circulation of the air. In some of the clearings, it was found that scores of sandal-trees had been destroyed, worth from five to fifteen rupees apiece, and gamboge-trees innumerable. The more intelligent among the natives of this Mulnaad (rain-country) complain of want of rain: the fall is not of the same amount as formerly.

'To give you some idea of the waste of valuable and ornamental timber in this country,' says Captain Harvey, in one of his letters, 'I will just mention what I discovered at Hyderabad. I was in want of light-coloured wood for picture-frames, and applied to the regimental contractor. What was my surprise to find that every third or fourth log in his great store of firewood was most beautiful satin-wood of large size! Only imagine the victuals of a whole regiment, not to say of a large community, being cooked with satin-wood!' Look also at what took place on the demand arising for gutta-percha as an article of commerce. Two hundred weights of this useful product were exported from Singapore in 1844; but such was the increase, that in three and a half years from that time, not fewer than 270,000 trees were felled for the sake of their sap, without a single effort being made to replace them.

According to Dr. Cleghorn, the natives were thinking of abandoning a tract about fifty miles from Coimbatoor, which had lost its rain through the loss of trees. Dr. Gibson, who travelled through part of the Bombay presidency, after an absence of fifteen years, saw great changes for the worse, and from the same cause. A similar change has been noticed in the Neilgherry Hills. The proprietor of a coffee-plantation near Bangalore, 'when clearing fresh ground which was watered by an excellent spring, was warned by the natives not to clear away the trees in the immediate neighbourhood of his spring; he disregarded their warning, cut down the trees, and lost his stream of water.' Such instances are numerous, as also those of clearing ravines for cultivation causing the disappearance of the brooks that once flowed refreshingly through them. From Afghanistan to the Burmese frontier, the phenomena have been observed as cause and effect.

Such an accumulation of facts forced itself on the attention of the authorities in India, and a system, on a small scale, has been commenced for restoring, at great labour and expense, what has so long been wasted. So far the results are satisfactory. The plantations formed along the line of the Jumna Canal very soon paid their expenses, and become every year more valuable. The natives have fallen in with the plan of establishing large mangrove gardens, and improve the trees with good grafts supplied by the government. —— Tucker, one of the European residents, has placed a gold medal at the disposal of the Horticultural and Agricultural Society of India, to be given to the planter of the greatest number of trees in the Agra presidency. In some places, regular plantations of teak are commenced as fast as the full-grown trees are cut down. These measures once taken, the consequences could hardly be other than beneficial in a country where wood is the universal fuel, and the consumers are numbered by hundreds of millions. The very thinnings repay more than the cost of management.

It thus happens that the recommendations of the committee of the British Association for 'careful maintenance, for the 'establishment of nurseries,' the checking of waste, and the planting of woods on 'tracts unsuited for culture,' have been to some extent anticipated. But much remains to be done before the true balance between physical and social requirements will be maintained. The alarming deficiency of rain around Bombay during the last monsoon is attributed to the destruction of the forests.

And in another point of view the preservation of trees becomes of importance—namely, as regards shade. In hot climates, the 'boundless contiguity' of the leafy canopy is appreciated with a feeling to which we of the temperate zone are strangers. In the past ages of India, this thing was cared for. One instance will suffice. During the reign of Akbar, direction was given 'that on both sides of the canal down to Hissar, trees of every description, both for shade and blossom, be planted, so as to make it like the canal under the tree in paradise; and that the sweet flavour of the rare fruits may reach the mouth of every one, and that from those luxuries a voice may go forth to travellers, calling them to rest in the cities where their every want will be supplied.'

Before concluding, we must just mention that an attempt has been made to throw further light on the question by direct experiment. The part
lars, supplied by M. Belgrand, are publishe
the *Annuaire* of the Meteorological Society
France for 1853, and give the results of tw
years' observation in the hilly parts of the P
basin. The author shows that the nature of
soil, as to permeability, has to be taken into acco
as well as the nature of the vegetation. Res
obtained in our climates would not be strictly a
logous with those of the tropics, where the le
never fall, unless the experiments were mad
some of the great European fir-forests, which
tain their resinous foliage all throughout the y

Truth-telling.

The man who would speak the truth, n
know what he troweth. To do that, he must h
an uncorrupted judgment. By this is not m
the most perfect judgment, or even the most
one but one which, however it may be biassed, is
bought—is still a judgment. But some peop
judgments are so entirely gained over by van
selfishness, passion, or inflated prejudices
fancies long indulged in; or they have the h
of looking at everything so carelessly, that they
nothing truly. They cannot interpret the w
of reality. And this is the saddest form of ly
"the lie that sinketh in," as Bacon says, wh
becomes part of the character, and goes on ea
the rest away.

To speak the truth, a man must not only h
that martial courage which goes out with so
of drum and trumpet, to do and suffer *great* thi
but that domestic courage which compels him
utter *small-sounding* truths, in spite of present
convenience and outraged sensitiveness or sen
lity. He must not be in any respect a slav
self-interest. Often it seems as if but a little
representation would gain a great good for us:
perhaps, we have only to conceal some trif
thing, which, if told, might hinder unreasona
as we think, a profitable bargain. The *true* t
takes care to tell, notwithstanding.

When we think that truth interferes at one t
or another with all a man's likings, and dislik
and wishes, we must admit, that it is the r
comprehensive and varied form of self-de
Truth-telling in its highest sense requires a t
balanced mind. Much exaggeration, perhaps
most, is occasioned by an impatient and e
moved temperament, which longs to convey its
vivid impressions to other minds, and seek
complying, to gain the full measure of their
pathy. But a true man does not think what
hearers are feeling, but what he is saying.
true people are kindred. There is a family
ness throughout them.

* * It is often extremely difficult in the m
things in this world to act truly and kindly
but therein lies one of the greatest trials of a
that his sincerity should have kindness in it,
his kindness truth.

Truth in business.—The more truth you
get into any business, the better. Let the c
side know the defects of yours; let them k
how you are to be satisfied; let there be as
to be found out as possible, (I should say noth
and if your business be an honest one, it wi
best tended in this way. The talking, bargain
and delaying that would thus be needless,
little that would then have to be done over a
the anxiety that would be put aside, would,
in a worldly way be "great gain." It is not,
haps, too much to say, that the third part of
men's lives is wasted by the effect, direct o
direct, of falsehoods. Each man should lo
his own truthfulness, and keep that up, ev

risk of saying, or doing something which may urned to ill account by others. Mere conceal- it is in most cases a mischief. A wise man ld be sorry that his fellows should think bet- of him than he deserves.

Potato Seed.—A quantity of potato seed has y been procured, by the agricultural branch of Patent Office, from Germany, with the view of primenting in the United States with different ties of this so important agricultural staple. curious fact, not generally known, connected the production of potatoes from seed balls is, no two stems will possess precisely the same ities, yet many of the tubers will appear so h alike that, when mixed together, they can- be distinguished by the eye, though it may en that one variety will be four times as pro- as the other, or may be much better in other ects. The tubers raised from the seeds of the ball are also prodigiously diversified in regard olor, being pink, black, red, white, green, yel- &c.; and as to shape, are round, nobbed and d in all proportions; as to size, some of them g no larger the first year than peas, while rs exceed the size of a pullet's eggs; as to liness" some of them completing their growth uly, while others will not put forth their blos- until October; as to productiveness, some t more than two hundred to one, while others give only three or four fold; as to spreading r the ground, some running out to a great nce, others growing quite near to the stem, descending deep into the earth, while others rise to the surface; as to quality, some will ugh and watery, some dry and mealy, some pleasing to the taste, while others will not alatable; as to the stems, some will carry a le rod, others an immense profusion of them, being very luxurious, while others will be fish. In short, as is very remarkable, no sort nnexion will be found to exist between any e peculiarities of the two specimens.—*Wash- on Star.*

Historical Society.

t the meeting on Second-day night, Charles ons presiding:

Francis Fisher called the attention of the ety to the renewal of Macaulay's attacks on iam Penn, in his later volumes. He had d to find a retraction or apology in them for calumnious attacks of the first, after their full absolute disproval; but being disappointed in he felt it his duty to protest on his own part, and part of the Society, against the malignant hos- of the most popular historian of the day. undertook to prove from internal evidence, and Macaulay's own authorities, how utterly e and impossible were the later charges nst the honour and veracity of our great der and lawgiver. J. F. Fisher stated that we expect to receive shortly from H. Dixon, who had access to full materials, a complete refuta-

One of the points Macaulay makes is that n, in his last days, was forsaken by the Society of nds. In answer to this, J. F. Fisher read the wing hitherto unprinted memorial.

testimony of Friends in Pennsylvania concern- their deceased friend and Governor, W. Penn. e find ourselves under obligation and con- both in duty and affection, to give this mark ur love and the honourable regard we bear to nemory of our late worthy Governor and well ved friend Wm. Penn, though it may not be part to attempt so ample and general a testi- y as seems justly called for. By his early incement of the blessed truth, his noble re- signation thereunto, his steadfastness therein, and great services to the church of Christ, as well by incessant labours in word and doctrine (made more extensive by the many excellent writings he hath published) as his valiant sufferings for purity of worship, and the testimony he had received, which, to him, might be the greater trial and conflict, his birth and station in the world placing him more in the notice of those of high rank amongst men than was commonly ye lot of many others of our worthy elders. Neither can it, we presume, be forgotten how, when it pleased the Lord to give some ease to his people, this our dear friend employed the interest he then had with success, and devoted his time and purse to serve not only his friends in their religious liberties, but them and others distressed, or any wanting favour even to ye neglect of his own just interest. But these memorials we leave to be made by those of our worthy elders in Great Britain, who have more instances and greater knowledge of those his traits, services and labours, than many of us can be presumed to be so fully acquainted with.

Yet it becomes us particularly to say, that as he was our Governor he merited from us love and true honour; and we cannot but have the same regard to his memory, when we consider the blessings and ease we have enjoyed under his government, and are rightly sensible of his care, affection and regard always shewn with anxious concern for the safety and prosperity of the people, who many of them, removed from comfortable livings to be adventurers with him, not so much with views of better acquisitions or greater riches, but with the laudable prospect of a retired quiet habitation for themselves and posterity, and the promotion of truth and virtue in the earth.

And as his love was great, and endeavours constant for the happiness of his friends, countrymen and fellow subjects, so was his great tenderness, justice and love towards the Indians, from first to last always conspicuous and remarkable. Here we cannot but gratefully and humbly acknowledge to the gracious God of all our mercies, the wonderful preservation of this colony from such injuries and barbarous depredations as have befallen most others; and add, that we believe the same love wherewith the Lord had so fully and effectually operated on the heart of this our worthy friend was the chief and durable motive of that his affection and kind behaviour towards those people; and was the cause, as he was made a means, of this our peace and preservation; so that his name remains precious even amongst the heathens.

More might be truly said of him, as he was ye Proprietary and Governor of this province, and we now find it our duty (incited thereto by the love of our Heavenly Father in our souls,) to add a few lines concerning him, as he was our worthy Elder, friend and brother in the blessed truth; many of us having been often comforted, edified and solaced with him in the enjoyment thereof. As was his testimony, so was his conversation, edifying and lovely, administering grace and knowledge. His behaviour was sweet and engaging, and his condescension great; even to the weakest and meanest, affable and of easy access; tender of every person and thing that had simplicity of truth or honesty for a foundation.

It was our comfort to understand that, after all his various troubles, trials and afflictions, when in an advanced age, infirmity of body, and a distemper which affected his memory in most other things which befel him, yet the love of God remained with him, and his sense thereof was frequently strong and evident, and, we doubt not, the blessing of the Almighty was his Omega.

So that we have assured hope, those afflictions being put off with his mortal body, immortality is given him by our Lord Jesus, and as he faithfully bore ye cross, the crown (which was his hope and long since in his eye) is his possession; and his soul received into that bliss prepared and appointed for the righteous.

Charles Gibbons, in further illustration of the justice of J. F. Fisher's remarks, that the authorities cited by Macaulay did not always sustain him, referred to one of his statements respecting what he calls a dogma of George Fox, that "a Christian was bound to face death itself rather than to touch his hat to the greatest of mankind." "When Fox was challenged to produce any scriptural authority for this dogma," says Macaulay, "he cited the passage in which it was written that Shadrach, Meshech, and Abednego were thrown into the fiery furnace with their hats on; and if his own narrative may be trusted, the Chief Justice of England was altogether unable to answer this *argument*, except by crying out 'take him away, jailor!'" For this statement, Macaulay cites Fox's Journal, page 166.

C. Gibbons said that the very authority on which Macaulay relies, convicts him of the grossest prevarication. When Fox and his friends were taken into court, they stood with their hats on, and the journal cited by Macaulay narrates that "Judge Glyn, a Welshman, then Chief Justice of England, said to the jailor, 'What be these you have brought here into the court?' 'Prisoners, my Lord,' said he. 'Why do you not put off your hats?' said the judge to us. We said nothing. 'Put off your hats,' said the judge again. Still we said nothing. Then said the judge, 'The Court commands you to put off your hats.' Then I spake and said, 'Where did ever any magistrate, king or judge, from Moses to Daniel, command any to put off their hats, when they came before them in their courts, either amongst the Jews, (the people of God,) or amongst the Heathen? *And if the law of England doth command any such thing, show me that law either written or printed.*' The judge grew very angry and said, 'I do not carry my law books on my back.' 'But,' said I, '*Tell me where it is printed in any statute book, that I may read it.*' Then said the judge, 'Take him away, prevaricator! I will ferk him.' So they took us away, and put us among the thieves. Presently after, he called to the jailor, 'Bring them up again. Come,' said he, '*where had they hats from Moses to Daniel?* Come, answer me; I have you fast

now.' I replied 'Thou mayest read in third of Daniel that the three children were cast into the fiery furnace by Nebuchadnezzar's command, with *their coats, their hose, and their hats on.*' This plain instance stopped him; so that, not having anything else to the point, he cried again, 'Take them away, jailor.'"

The Chief Justice was entirely worsted in the encounter; but Macaulay seems to consider that a historian may suppress the truth whenever it conflicts with his own prejudices, or suits his own purposes to do so.

Epistle of George Fox.

Friends,—You that keep your habitations in the truth, that is over all, see that it is the same spirit that leads the backsliders and apostates now, from the spiritual fellowship and unity of God's people, and the church of Christ, that led Adam and Eve from God, and the Jews from God and his law, to rebel against his Spirit. This spirit is the same that was in the world, which got into the Jews, when they were gone from the Spirit of God; and then they turned against God, and his prophets, and against Christ and his apostles. This spirit led them to be as bad as Pilate or worse. The enmity or adversary got within them, against the truth, and them that walked in it, and the Spirit of the Lord; so that they killed and destroyed the Just. This was the spirit of the devil, the destroyer, who sought not only to destroy the truth, but the order of it, and them that walked in it, when true Christianity was planted among the possessors of the light, grace, and truth, and the holy gospel faith and Spirit, who enjoyed Christ in their hearts. But when some began to err from the Spirit and faith, to hate the light, disobey the gospel, turn the grace of God into wantonness, walk despitefully against the Spirit of grace, turn from the Truth, crucify to themselves Christ afresh, and put him to open shame; these were they that let in the spirit of the world; who held the form of godliness, but denied the power thereof; and troubled the churches in the apostles' days; when the spirit of Satan had got into such, they were more troublesome to the church than the open persecutors that were without; these got into the assemblies to deceive the hearts of the simple, having the good words, fair speeches, and sheep's clothing. Paul, Peter, John, Jude and James had much to do with such, to keep them from troubling the church of Christ; for they are out of the life, power and Spirit; therefore, the apostles of Christ exhorted the saints to keep to the Word of life within; to the anointing, to the grace, truth and Holy Spirit in their hearts. This foul spirit will profess all the Scriptures in words; but by the Spirit of God, which is holy, this spirit is tried, and its fruits. So the apostates went from the power and Spirit of God, and turned against the prophets and the martyrs of Jesus; and became the whore, whose cup all nations drank of. The dragon with his tail threw down many of the stars, and would have devoured the woman with his flood; but the woman, the true church, was preserved; for the gates of hell cannot prevail against her; and then the dragon made war with her seed. So the dragon, the whore, the beast, and false prophets, all made war against the Lamb and the saints; but the Lamb and the saints will overcome them all, and will have the victory. And now the everlasting gospel is preached again to all nations, tongues and peoples; and many are gathered into the gospel, the power of God, are turned to the light which is the life in Christ, are grafted into him, and are come to walk in the order of the new covenant of light and life, in the gospel of peace and salvation. The same spirit that opposed the apostles and churches in their days, opposes now; yea, it is the same that opposed Christ, and disdained him that disdaineth God's servants now. The same that opposed the prophets, and rebelled against Moses, opposes and rebels against God's servants and people now. It is the same dark, blind, disobedient, faithless, wilful, jealous spirit, that persecutes, some with the hands, others with the tongue. It is the same spirit of enmity, the adversary and destroyer, that tempted Adam and Eve to disobey God, and deceived them; which deceived the Jews, and tempted them, and deceived all those that went from the church, in the apostles' days. And it is the same spirit that is now going about, sometimes like a roaring lion, sometimes like a twining serpent to tempt, to deceive, and to devour, in those who have fair speeches, good words, and sheep's clothing, in a form of godliness, and under pretence of light and liberty, but who deny the power thereof, and inwardly are ravening wolves; and if it were possible, they would deceive the very elect. But the elect are in the covenant of light and life, and in the power of God over them, and in Christ who will grind them to pieces; and will slay all his enemies with his spiritual sword, who will not have him to rule over or in them.

In Christ, all his people have rest and peace, who is their sanctuary over all storms and tempests. In Christ the sanctuary, no deceiver nor destroyer can come; for he is a place of sweet rest and safety. Hallelujah! praise the Lord for his sanctuary. Amen. G. F.

London, 1681.

Volcanic Explosions in Arkansas.

The Little Rock Gazette has the annexed interesting letter from a correspondent in Johnson county, Ark., dated Clarksville, January 5:

On the 3d day of December last a singular noise was heard here. It has been differently described by those who heard it, as like a blast in a well, the explosion of a meteor, or a single distant clap of thunder. So far as ascertained, nearer the centre, or place of explosion, there was a rumbling and a sensible vibration of the earth.

Much speculation was had as to its cause. It was not probable that it was thunder, for it was mid-winter and the sky was clear; nor blasting in a well, for people do not work in wells in the wet and wintry season. Upon inquiry we found that the explosion had been heard as far as Fort Gibson, and generally in a circle whose diameter is two hundred miles, and expected to find some notice of it in the papers of your city. The other day, Col. Logan, of Scott county, visited our city, and gave us an apparent solution of the mystery.

It appears from his statement that Wm. Gipson, while bear hunting on Christmas day, attempted to cross Dry Creek mountain, situated in T. 5 N., R. 26 W., but found the mountain to be on fire. Gipson describes it as sending forth smoke at the top, which at night has a ruddy glare and is visible for miles. For several acres around, the leaves appear to have withered on the trees during the summer. The ground is heated, and on the sides of the mountain are numerous fissures, through which hot vapour is constantly escaping. Gipson says that the steam or vapour was so hot as to be painful to the hand when held over it. He was so much alarmed that he did not venture far up the mountain side, nor did he state that there was a crater, or discharge of lava, &c. However, Col. Logan has promised to visit the volcano, which is within five miles of his residence, as soon as he arrives at home, and write to me a full and particular account thereof, which I will orward to you.

But the knowing ones here say, that the noise or explosion on the 3d of December last, did not p ceed from the volcano in Scott county, but fr an eruption in this county, at a spot on the sou side of the river, below Pittsburg, and not far fro the residence of Col. Hardwicke. A place h been lately found there, where the earth h bursted or broken up, throwing out huge mass of rock, earth, &c.

This latter supposition agrees with the suppos direction of the noise from this place. They s that this volcano in Scott county has been in an i cipient stage for eighteen months past; that t fact of Gipson stating that the leaves on the tre appeared to have withered during the summer, an the roots of the trees appeared being gradual destroyed by the subterranean heat, antedate th day of the explosion heard lately. In further sup port of their opinion, they cite the fact that a eruption took place some ten years ago in th county, near the Newton county line, in T. 12. N R. 23 W. It occured during the night, threw u huge boulders of rock weighing several tons, we heard at a great distance, and, in fact, was a sma local earthquake. So, too, some fifteen years ag a tremendous explosion was heard in Yell an Johnson counties, the cause remaining unknow until a short time thereafter, when a hunter cros ing the Magazine Mountain found where it had bee rent asunder—absolutely split in two, leaving cleft or fissure varying from two or three feet as many inches in width.

Selected.

I have lying before me a sermon very recentl delivered in one of our large cities, and printe only for private circulation. I will borrow it closing paragraph:—"My hearers, be cautione against such abuses. Let us bridle our tongues Let us put a check upon our curiosity. 'Do you own business.' Next to your own, be careful o your neighbour's reputation. Be slow to believ aught against him. Give no credence to flyin reports. Reject unfounded insinuations. Pay n attention to rumours that go about like orphans i the world, or foundlings whom none dare own Remember, 'that what everybodysays must b true,' is a sophism worthy of the father of lies As matters stand, everybody's word is worth no body's taking. If you hear against your will, de mand proof of what you hear. Let not the scarcity of truth be atoned for by the abundance of affidavits Keep truth on your side. Speak evil of no man If your neighbour injures you, tell him his fault alone. If he wish it, forgive him. Be no busy body. Hate tale-bearing. O, if all would d thus!—would their not be a millennium? Bu poor, weak, perverse human nature! wicked an inexcusable, as well as human! Alas my hearers!" —*Late Paper.*

When we are shaken with an uncommon, un expected stroke in our experience, we are like the needle in the compass-book, greatly agitated, and it will take some time before we settle so as to be able to traverse truly; but by centering in a state of quietness and acquiescence to the Divine will we shall feel the influence of the heavenly attraction, and our spirits will be directed in the right line of duty, to our own and the Master's praise. —*T. Neale.*

I have sometimes thought, it is not a hard thing to follow Truth when it is exalted, and triumphs over all and reigns in glory; then many will speak well of it; but when it comes to suffer, be buffeted, mocked and reviled, then comes the trial of our love, and we see many who are not willing or able to bear these things.—*Deborah Bell.*

SEEING A SUN-DIAL IN A GRAVE-YARD.

Gray dial-stone, I fain would know,
What motive placed thee here,
Where darkly opes the frequent grave,
And rests the frequent bier;
Ah! bootless creeps the dusky shade,
Slow o'er thy figured plain:
When mortal life has passed away,
Time counts his hours in vain.

As sweep the clouds o'er ocean's breast,
When shrieks the wintry wind,
So doubtful thoughts, gray dial-stone,
Come sweeping o'er my mind.
I think of what could place thee here,
Of those beneath thee laid;
And ponder if thou wer't not raised
In mockery o'er the dead.

Nay, men, when on life's stage they fret,
May mock their fellow-men;
In sooth, their soberest freaks afford
Rare food for mockery then.
But ah! when passed their brief sojourn,
When heaven's dread doom is said,
Beats there the human heart could pour
Light mockeries o'er the dead?

The fiend unblest, who still to harm
Directs his felon power,
May ope the book of grace to him
Whose day of grace is o'er;
But never sure could mortal man
Whate'er his age or clime,
Thus raise, in mockery o'er the dead,
The stone that measures time.

Gray dial-stone, I fain would know
What motive placed thee here,
Where sadness heaves the frequent sigh,
And drops the frequent tear.
Like thy carved plain, gray dial-stone,
Grief's weary mourners be;
Dark sorrow metes out time to them,
Dark shade marks time on thee.

I know it now: wer't thou not placed
To catch the eye of him
To whom, through glistening tears, earth's gauds
Worthless appear, and dim?
We think of time, when time has fled,
The friend our tears deplore;
The God whom pride-swollen hearts deny,
Grief-humbled hearts adore.

Gray stone, o'er thee the lazy night
Passes untold away;
Nor were it thine at noon to teach,
If failed the solar ray.
In death's dark night, gray dial-stone,
Cease all the works of man;
In life, if heaven withhold its aid,
Bootless these works, and vain.

Gray dial-stone while yet thy shade
Points out those hours are mine,—
While yet at early morn I rise,
And rest at day's decline,—
Would that the sun that formed thine,
His bright rays beamed on me
That I, wise for the final day,
Might measure time like thee!

For "The Friend."

Early Anti-Slavery Advocates.

BENJAMIN LAY.

(Concluded from page 220.)

The following address to ministers has no date to it.

"Abington, between 11 and 12, after a good meeting at Oxford, where were 6 males and 4 contra.

"Dear Friends,—I remember, about 40 years ago I kept my elder brother's sheep, and the pretty lambs and their dams would be quietly, sweetly, and prettily feeding together,—a very beautiful and comely sight to see. But if a stranger, my Friends, the stranger, came near with his dog, (the dog sucks the blood, which is the life of the sheep,) and if this dog fell a barking, yawling, or howling, among the sheep and the pretty dear lambs, immediately they left their feeding, and ran for their dear lives. So, they would be scattered, and scattered, although there was or might be a great flock of them together. Sometimes, I must confess, I have been a little careless and sleepy like some other shepherds, and then the sheep would go wandering about over hedge and ditch, and get into my neighbour's corn and do mischief; and then it was very hard for me to get them out of the corn, and into order again. Sometimes it would cost me many tears. Sometimes, if the sheep and lambs were not gathered before night, in the dark the dog would come and bite many of them, and suck their blood, and some he would kill. So that would be a grief to the owner, and a reproach to the shepherd.

"So, my very dear Friends, you that are the right true shepherds, that love the sheep more than all things in this world, you can very easily make an application, for it is your life and delight to take care of your father's sheep and his lambs especially, and are grieved when the dog, the blood-sucker, does but bark, and hinder them from feeding. I know what I write, blessed be the name of the good and great Shepherd, forevermore; who laid down his life for his sheep and lambs.

"My dear, faithful Friends, you are much esteemed by me, and your unity in the Father in his kingdom, which is his church, is much more desired by me than all things in this world, I can truly say. It has been much in my mind for a considerable time, to lay before you my concern for having some of our ancient worthy Friends' epistles of warning, reproof, caution and advice to ministers, collected and reprinted; apprehending it may be of some service to have a collection of such as I have mentioned." B. L.

Among Benjamin Lay's sincere friends, and one to whom he gave the right hand of unity, was John Cadwallader, a minister of the gospel, residing at Horsham. Benjamin wrote many letters to John, some of which have been printed. We give some extracts from one, on the ministry.

"Dear John,—This morning, as I was in my garden pulling up some weeds, it came in my mind what was objected against me lately, by one that ministers amongst us, N. A., [Nicholas Austin,] and hath for near twenty years; that I was for setting up some ministers, and pulling down others. Dear Friend, I must confess I do not approve of a false minister, much less to set him up, neither would I pull down the true * * * *. If one should ask any Friend, even a false minister himself, if we might at any time receive or do aught to encourage a false minister, or approve, join and unite with him in prayer or in his testimony, he would answer in the negative. * * But then, says he, who shall be judge? Why, truly, I may say if we have no judgment in our goings and doings, we are in a very poor dark condition, as false ministers and prodigals would have us, that we might receive such husks as they have to feed swine withal. The true children in the true kingdom cannot feed on such chaff. If they offer to receive it by conniving at or seemingly approving of, or joining with such swinecherds, they will be in danger of being choked. * * * If any one offers to prove or make manifest [to the false ministers] their pretension to preaching is all deceit and cheat, and that their seeming seed-corn is nothing but chaff and husk, their peace flies away at once. This I have often seen in England, here, and elsewhere. * * * * There are some others amongst us, I am well satisfied, that have been favoured with a part and a portion, and a good portion, too of the ministry, with the saints and faithful ones, and have reigned with them in the firmament of God's power, and I would to God that they did so reign still! But alas! alas! some of these are fallen, not from words, but from life, and that is all in all. The dragon's tail hath prevailed, drawn them down to the earth—they smell and savour of it, who were once fresh and lively, feeding in the green pastures. They loved to sit in silence in meetings—silent as a flock of sheep and lambs in a field, sweetly feeding, without noise of words. But alas! some of these are grown restless and uneasy in sitting in silence, but must and will be hammering and tampering, especially, if they feel but a little tickling of some former or old experience, or a drop of wine in their old bottle, undigested and unrefined, thick and muddy, the bottle not being very clean. Having a strong opinion of their own performances, and a rich conceit of the great good they do and have done; to work they go, with noise of words, and oftentimes no sense. Then comes forth the tongue of the Egyptian sea, and the language of Ashdod is heard, and the linsey-woolsey garment is seen, and the plowing is managed with the ox and the ass joined together. Poor plowing with beasts so ill-matched, so unequal in their nature and stature; one drawing one way, and another another way. Then the field is sown with two sorts of seed, may be a little good, and a great deal of bad. I wish these plowers and sowers would stand still a little, and look over the field they have plowed and sown, and behold the produce of their labours.

"Those that go forth with sparks of their own kindling, shall lie down in sorrow. Oh, that these would wait for the still small voice, that would direct them aright, when and what to speak to the people, and when to be silent; and not go forth in the hurry and bluster of their own spirits in their own time; but wait the Lord's time, not in the fire, nor the wind, nor the earthquake, where the pure Truth is not known, nor its voice heard."

On one occasion, when the ground was covered with a deep snow, Benjamin Lay, on a meeting-day, stationed himself by the gateway into the meeting-house yard, with his right leg and foot bare to the snow and frost. When reasoned with for exposing himself to the danger of sickness or disease in so doing, he promptly replied to some who held slaves, "Ah! you pretend compassion for me, but you do not feel for the poor slaves in your fields, who go all winter half clad." In thus acting, he probably had some one whom he wished particularly to rebuke.

One of his neighbours who held slaves, had often been laboured with by him, in fruitless endeavours to convince him of the iniquity of the practice. Failing in argument, he one day undertook to give a practical evidence of one of the evils belonging to the system of slavery. His neighbour had an interesting son, of about six years of age. This child, Benjamin, met at a distance from his home, and with kindness led him to his

habitation, where he contrived so to amuse the boy that he kept within his house all day. Towards evening, seeing the parents of the boy coming towards his house, evidently in deep distress, he went to meet them. To his inquiries they answered, "Oh, Benjamin, Benjamin! our child is gone; he has been missing all day." To this he replied, "your child is safe in my house, and you may now conceive of the sorrow you inflict upon the parents of the negro girl you hold in slavery, for she was torn from them by avarice."

Roberts Vaux narrates, that a person whom he calls "Governor Penn" in the text, and Richard Penn in a note, with Benjamin Franklin and some others, induced by curiosity, paid Benjamin a visit, before he had removed from his cave house. According to this narrative, Lay received his distinguished visitors with politeness, and after some interesting conversation with them, had his table set for dinner. It was plentifully provided with vegetables and fruits, and of these he invited his guests to partake. His language was more bluntly honest than would have been agreeable from any one else than a humourist; but from him, nothing of course would give offence. He said, "This is not the kind of fare you have at home, but it is good enough for you or me—and such as it is, you are welcome to eat of it." If this interview took place before the death of his wife, as it appears in the narrative we have been quoting, the visitor must have been either Thomas or John Penn; Richard was not then in America.

Lay continued his labours in the anti-slavery cause, arguing, distributing pamphlets, contending in season, and out of season, with all who came in the way. He intruded into other places of worship, beside those of Friends, and was often carried out of them. He was naturally a shrewd man, and was of a ready wit, and thus those who disputed with him, were often more than matched. When Captain M'Pherson, the privateersman, undertook to make diversion for a company riding with him, at the expense of Lay, who was walking into Philadelphia, he singularly failed. "Sir, your humble servant," cried M'Pherson. "If thou art my servant, clean my shoes," retorted Lay. Taken a little aback, the captain then inquired if he could tell him the direct road to heaven. "Do justly, love mercy, and walk humbly with thy God," was the prompt and appropriate answer. Mortified, and doubtless conscience-stricken, the man of rapine and blood rode on, feeling that he had met with a public rebuke which he dare not resent, and that his attempt to raise a merriment at the expense of the humble philanthropist, had but opened the way to his own mortification.

B. Lay would not willingly partake with those who kept slaves. On one occasion, finding a slave in attendance at a house where he was invited to breakfast, he said to the master, "I will not share with thee the fruits of thy unrighteousness;" and immediately departed. He was charitable to those he thought truly deserving, who, by disease or some other dispensation of Providence, were reduced to need assistance, but he had no compassion nor patience with professed beggars. He said, "Any one who is able to go abroad and beg, can earn four pence a day, and that is enough to keep a person above want or dependence in this country." On one occasion, having ascertained that a poor woman needed and deserved relief, he gave his informant some money, saying, "Lay this out for her, but don't let it be known where it came from."

His residence, towards the close of his life, was at the farm of John Phipps, near Abington Meeting-house. Here he enlarged a natural excavation in a bank, until he had made an apartment for reading and retirement. The room is said to have been neatly ornamented with evergreens, and to have contained a well selected library of nearly two hundred volumes. Among other sources of innocent amusement to him, was the preparation of hives for bees, and the watching the habits and labour of those industrious and sagacious insects. He had a large community of them about him, their dwellings extending more than one hundred feet in a continued line. Honey was one of his articles of food.

Concerned members in the religious Society of Friends, had been, from year to year, calling the attention of their fellow members to the subject of slavery, and various steps had been taken to prevent either the importation, selling or buying of slaves. In the year 1758, the Yearly Meeting was prepared to direct that if any one should vindicate slavery, or be concerned in importing, selling or purchasing slaves, they should be considered no longer in unity, and should be prevented from sitting in meetings for discipline, and from subscribing to the funds of the Society. After the Yearly Meeting which took place in the Ninth month, was over, a friend of Benjamin Lay's visited him, and told him of the conclusion Friends had came to. On hearing it, the heart of the weak and feeble old man was filled with pious gratitude and joy. He rose from his chair, and exclaimed, "Thanksgiving and praise be rendered unto the Lord God." He added after a pause, "I can now die in peace."

In the following First month, Benjamin Lay was taken sick whilst from home, and was conveyed to the house of his friend, Joshua Morris. Finding that his close was approaching, he made some distribution of his property, giving forty pounds to the Society of Friends at Abington, for the education of their poor children. He closed his earthly career on the 3d of Second month, 1759,—about two weeks from his first attack.

The character of Benjamin Lay possesses less attraction to my mind than that of Ralph Sandiford. There was more roughness and asperity in it, but not more strength. His arguments are no stronger, even where his denunciations are far more severe, yet he probably, in the overruling Providence of the Almighty, had his use in opening the eyes of some to the enormity of slavery. How much more good he might have effected, had he been always clothed with a gospel spirit in his labours of intended benevolence, we cannot say. One thing we know—his fierceness raised up the spirit of enmity in many, and caused his own path to be unnecessarily rugged. His eccentricities, without doubt, often were the product of insanity, and therefore furnish no proper cause for censure.

Roses propagated by cuttings of the roots.—A writer in the Horticultural Cabinet says: Having been advised to try the experiment of raising rose trees by taking cuttings of the roots, I did so, and found it to succeed admirably. The mode was as follows: The first week in March, I took some of the long, thick, fleshy looking roots of my English, French, Moss and Perpetual roses, and cut them into pieces about three inches long. I then smoothed the surface of a border in front of a peach wall; upon this I laid the roots flat, at about six inches apart; when the roots were placed, I covered them with fine sifted earth, half an inch deep, gently beaten into the cuttings. I then laid four inches more of loamy soil, well enriched, giving the whole a good watering, and when dry, smoothed the surface over with the back of the spade. By the middle of May, every cutting had sent one, and some two strong shoots, and on examination, I found the soil I had covered the cuttings with to be fil with a mass of fine roots. I have anxiously wate the bed, as being in a sunning situation, I fou it got more dry, more especially so, from the l being raised from the old suface of the border would have been better to have sunk it, so as fina to have it even with the surroundings.

The following, which was received several we ago, was mislaid, or it would have been earlier tended to.—*Ed.*

For "The Friend

I should be glad to see published in the colum of "The Friend," Joseph Pike's advice to children on the subject of marriage, but, m particularly, what he says in regard to the duty children to their parents, and parents to their ch dren.*

To be "put in remembrance of things that already know;" has a tendency sometimes "to s up the pure mind by way of remembrance:" O, how I have desired we may individually be w ing to search ourselves, search our own houses our own children, and see if there be *any tha* the Lord's controversy is against. "Let Ephra alone, he hath joined himself to idols." "Ephrai hath mixed himself among the people; Ephra is a cake not turned." "Strangers have devour his strength, and he knoweth it not." Hosea, 8, 9.

May this not be applicable to us as a people, even as individuals; but, may we "gather up t loins of our minds;" "watch and be sober, for t end of all things is at hand." 1 Peter, iv. 7.

Twelfth month, 1855.

"As I have had occasion to mention marriage, is in my mind to add something upon that hea for the instruction and information of you my ch dren, or others, into whose hands this may co it being the matter of the greatest importanc a man's whole life. Marriage is a divine insti tion, and our Lord and Saviour Jesus Christ m in relation thereto, "What God hath joined t gether let not man put asunder," Mark, x. So, the true joining in marriage, is of the Lo and his mind should be sought therein, so far we are capable of knowing it; and though in su undertakings, we are not to expect a miracle confirm it; yet the children of the Lord, walki in his light, having the eye of their mind sing unto him, for his counsel in their choice, and wi sincere desire to know his mind therein, I do firm believe, his holy and divine providence will ha a share in this great and most important affair, a then the choice and joining will have the Lor approbation. But, alas! too many, even amo our Society, for want of first seeking the Lor counsel, by waiting in his light, to be directed him, have, on the contrary, made either outwa beauty, a great portion, or worldly interest t very first object of their choice, by which they ha grievously missed their way, and rendered the future lives uncomfortable. To speak more pa ticularly from my own experience, I can in tru say, I earnestly desired to know the Lord's mi therein; and if I could have known that he ga not his approbation to my choice, I verily believ though in the greatest cross to my own mind, should have declined the prosecution of my inte tion. And therefore, for some time I waited wi a single mind upon the Lord, and with sincere d sires in my soul, to be guided as he should dire me; that if my intentions were not consistent wi his divine will, they might be frustrated some w or other. And in my thus waiting in the ligh

---

* See Friends' Library, vol. ii., page 353.

ound in the end great clearness and satisfaction mind to proceed; and it was attended with sev- l signal evidences for my confirmation, that my ice was pleasing to the Lord. * * * "It is very plain that too many unduly covet and e lawful as well as unlawful things. Christ spared the kingdom of heaven to a marriage per, to which many were invited, but none came; y made excuses, one went to his farm, another his merchandize, oxen, &c., and a third had rried a wife; these were all lawful things, and d in their due time and place. But Christ d them, He that loveth father or mother, wife children, brothers or sisters, yea, and his own , also, more than him, were not worthy of him, ther can be his disciple, and that he, who taketh up his cross and followeth him was not worthy him; adding, "He that findeth his life," that in the inordinate love of those things, "shall e it; and he that loseth his life," that is, in ying himself of the inordinate love of these ngs, "shall find it." Matt. x. 37 to 39. Thus plainly appears, that those who were invited to e marriage supper, loved those lawful things, as ms, lands, merchandize, oxen, and wives, more n the Lord, and could not lose their life in the sent enjoyment of them, for the Lord's and the gdom's sake. Thus, a person of moral charac- , who loves father or mother, wife or children, use or lands inordinately, they having too much m in his heart, there is little room left for rist, his life being more in them than it ought be. And if he cannot take up Christ's cross the excessive love of these lawful things, he rtainly loves them more than Christ, and is not rthy of him, neither can he be his disciple. ad let this be an infallible sign or mark to all ose, who say they love God above all, to try emselves by. Most certain it is, that whoever es or delights in anything beyond due bounds, it be ever so good or lawful, sets up an idol in s heart, and worships it, without being a pro- ssed outward idolater, and this is confirmed by cripture, which says, that covetousness is idolatry. y the above we may explain what Paul meant, But this I say, brethren, the time is short; it maineth, that both they that have wives, be as ough they had none; and they that weep, as ough they wept not, and they that rejoice, as ough they rejoiced not; they that buy, as though ey possessed not; and they that use this world, not abusing it; for the fashion of this world sseth away," 1 Cor. vii. 29. In this frame of ind it is, that the lawful things of this world may loved and used in free and single resignation the mind and will of God, and then Christ, our earest Lord, will be loved, served and delighted more than all.

(Concluded next week.)

Verd Antique Marble.—Probably but few of our aders are aware that Vermont is now furnishing eautiful and perfect specimens of what has been ound only among the ruins of ancient Greece and Rome, and known to us as *Verd Antique Marble.* A quarry of this rare and elegant marble was dis- overed, some three years ago, at Roxbury, near Northfield, Vt., on the line of the Vermont Central Railroad. A company was formed and incorporated to work the quarry, or quarries, and are now tak- ng out large blocks, of almost any desirable size, f perfectly sound and beautifully variegated green nd white marble.

This marble has been subjected to chemical and ther tests, to determine its quality and fitness to esist heat and cold, dampness and exposure, and as, thus far, stood these tests triumphantly. It s said to be like, and quite equal to the admired remains of ancient verd antique marble, found in the ruins of Grecian and Roman temples. A quantity of it has been ordered for Washington, to be used in the extension of the capitol. The committee having in charge the Franklin Monument, which is to be erected in Boston after visiting the quarry at Roxbury, have decided to use this marble in the pedestal of that monument. It is easily sawed and chiselled, takes a fine polish, and is adapted to various ornamental uses.—*Bost. Trav.*

For "The Friend."

A Call to the Young.

Oh that the beloved youth of our Society would willingly bow their necks to the yoke of Christ, then would they find it to be easy, and his burden light, and also find rest to their souls. Be entreated by one who loves you and earnestly desires your everlasting welfare, to give diligence to make your calling and election sure. Let not the world nor the things of it, steal your affections from Christ, but let it be the travail of your souls that obedience may keep pace with knowledge. If you are but willing to bear the cross you will be enabled to see with sufficient clearness a way cast up for you to walk in. Though thousands may fall at your side and ten thousands at your right hand; if you are but rightly engaged to listen to and yield obedience to his still small voice in the secret of your hearts, which is sufficient to guide you into all truth, there shall no evil befall you. This is indeed a day of treading down and perplexity, yet this power is the same yesterday, to day and forever. May you look to him in the hour of trial and temptation that shall come upon all flesh to try them that dwell upon the earth, and not look at the frailty and weakness of those that should have stood as way-marks in our society. If our brethern or sisters through unwatchfulness, worldly-mindedness, or disobedience, have turned aside, either to the right hand, or the left, does it not behove us to strive with increasing earnestness to stand upon the watch. If we fall, the fault will be our own. He still waiteth to be gracious.

You, my dear young friends, who have stumbled at the cross, and are wandering far from your Heavenly Father's house seeking pleasure in the gratification of your own sinful lusts, I would most tenderly warn you of your danger, and plead with you to return. Oh, hearken to the voice of his love whilst the day of merciful visitation is still extended. Though you may be in the bloom of youth, you know not how quickly you may be summoned to appear before Him, whose mercies you have slighted, and from whom no action can be hid, to receive the reward of the deeds done in the body. Return, return: the fountain is still open for sin and for uncleanness; you know not when may be the last offer of his love and mercy. *Turn* to him who in his adorable condescension still pleads with you in order to bring you home to himself. As you prize the welfare of your immortal souls, reject no longer the offers of his love and mercy; no longer wander in a thirsty land, but arise and go to the Father and say, I have sinned against heaven and before thee, and am no more worthy to be called thy son, make me as one of thy hired servants. Surely, if you are but willing thus to humble yourselves before him, he will receive you into the arms of his love, and you shall taste his goodness and be satisfied.

Ohio, Third month, 1856.

The study of *Natural History* is within the reach of every one; and he who is engaged in it is presented at every step in its progress, with something capable of awakening pleasing emotions. The whole earth is to him a vast museum in which are crowded beautiful and sublime objects, animate and inanimate, in an almost endless variety, all combining to amuse the understanding and gladden the heart. This search into nature produces also a highly beneficial influence on the understanding. Mathematics do not more effectually strengthen and discipline the judgment. By a continual analysis, comparison, and generalization of things, the study of natural history teaches the art of thinking clearly and accurately, and of reasoning with precision and force, with a much less degree of weariness, than that which usually accompanies the study of simple quantities and mere abstract forms.—*Ocean Flowers and their teachings.*

Those hours are not lost that are spent in cementing affection. For a friend is above gold, precious as the stores of the mind.—*Tupper.*

THE FRIEND.

THIRD MONTH 29, 1856.

The afflicting calamity which occurred on the Delaware river opposite our city two weeks ago, is probably by this time familiar to most of our readers. In the "Summary of Events" given in our last number, the burning of the ferry steamboat New Jersey was mentioned, and the great loss of life attending it. It is now ascertained that the whole number who perished was sixty-one, most of whom were citizens of Camden, N. J. This awful event has brought mourning into many families, and for a little while it spread a gloom over our whole community; but the impression, vivid as it seemed at first, is gradually giving place to those of every-day life, and probably its startling thrill of horror together with its loud admonition, will soon be obliterated from the memory of the greater part of those who have felt them. And yet there are some considerations connected with it, that do not attach to the many steamboat and railroad accidents which of latter years have become so common. To how few of the many hundreds who are passing and repassing from one side of our river to the other, has the thought of danger to life in the transit, ever before occurred. It could hardly have been believed that in a passage which is generally performed in from seven to ten minutes, across a stream running between two cities, and so covered with craft of various kinds, a steamboat could take fire, and burn to the water's edge, and three-score human beings perish in the flames, or in the water. It is so easy for the mind to conceive much more than the body can perform, that had the idea of fire occurring on board one of these boats presented, almost every one would have imagined various modes of escape easily commanded, and almost certain of success; and yet the sad reality forces the conviction upon us, how utterly unavailing all human efforts to ward off the stroke of death may prove, even when put forth under circumstances presupposed as most favourable to a propitious result.

It is so common to hold up such occurrences as exemplifying the uncertainty of life and all human state, that we are not disposed to dwell thus upon it, nevertheless all should be willing to ponder it and the great truth that it inculcates, long and deeply enough to strengthen the moral discipline of the mind, and promote an increase of watchfulness and virtue. Most of us know the things of time change and shrink to their real value, when severe sickness has brought us to the borders of the grave, and death seems close at hand, and this awful calamity, in which many of us feel as if we might have been involved, may readily be so vividly brought home to us, as in

some measure to produce the same effect as a severe attack of disease, and thus lead us to estimate more correctly the responsibility of our position, and the intrinsic value of the things we are pursuing. Surely, the sense of how speedily the scene of life may close upon us, should bring home the importance of being prepared to close it well.

The sudden termination of the lives of so many, under circumstances similar to those to which the most of them had been exposed, every day perhaps, for a long time, is calculated to remind us all of our dependence on the protecting care of our Almighty Father; and the unceasing mercy which He extends to us in our every-day walk through life; guarding us by his providence from the impending stroke of death, and thus lengthening out the period of probation and preparation for the awful realities of eternity. We can thus more fully realize the value of each moment as it passes away, and the importance of so improving it as to be ready for the great change, let it come when or how it may; remembering the debt of gratitude we owe, that we cannot depend upon a future which may not be granted to us, and that with all our diligence we shall not have more than sufficient time to make our election sure.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 8th inst.

The Peace Conference.—The fifth meeting of the Plenipotentiaries was held on the 6th inst., but nothing has been permitted to transpire respecting their proceedings. The general impression was, that they were progressing favourably.

The War.—The Russians are sending troops in considerable numbers to Finland. They are also concentrating a large force around St. Petersburg, and strengthening the barriers near Cronstadt. Admiral Watson has sailed from Kiel. He has ordered the fleet to assemble off Maer Island, to renew the blockade of the Russian ports. Orders have been received at Marseilles, for the conveyance of 10,000 infantry and a battery of artillery to the Crimea, to replace the troops returned home. Delegates of the two belligerent armies met on the 29th of Second month, to concert measures for carrying out the armistice. The Paris Moniteur, of the 7th, contains the Imperial decree calling into active service 140,000 young soldiers of the class of 1855. In the Emperor's speech to the Senate at the opening of the session, he expressed the hope that peace would be the result of the pending negotiations, but said that France must be prepared for either peace or war.

TURKEY.—One hundred millions of piastres in new paper money have been issued by the government. There was much disunion in the divan on the subject.

FRANCE.—A bill has been prepared for lending $4,000,000 sterling to the Credit Foncier, to be applied to the improvement of agriculture.

GREAT BRITAIN.—Additional insurance had been effected on the steamship Pacific at Liverpool, at 80 per cent. There was an increase last year in the shipments, from the United Kingdom, of plain and printed calicoes, of 226,107,872 yards, over those of 1854.

The Markets.—The sales of cotton at Liverpool for the week reached 64,000 bales; the quotations were not changed. Breadstuffs had further declined. Western Canal flour, 31*s.* a 32*s.*; Philadelphia and Baltimore, 34*s.* a 35*s.*; Ohio, 36*s.*; red wheat, 9*s.* 6*d.*; white, 10*s.* 6*d.* per 70 lbs. The London money market continued stringent. The rate of discount was 6 a 7 per cent. Consols, 91¾.

CHINA.—Hong Kong dates to First mo. 15th, had been received in England. At Macao, the greater portion of the Chinese town was destroyed by fire on the 4th and 5th of First mo. Upwards of a thousand houses are said to have been burned. The loss of property was more than $1,000,000. The Chinese rebellion appears to be again making head against the government. In Kwangsi, the rebels have entire possession of a part of the province. The province of Houan in the north, is also in a state of insurrection.

UNITED STATES.—*Congress.*—A new tariff bill has been reported in the Senate, which proposes, among other changes, to increase largely the number of articles on the free list, including the materials of manufactures. After a long and earnest debate, the House of Representatives has decided by a vote of 101 to 92, on the appointment of a committee of three of the members to be chosen by the Speaker, whose duty it shall be to proceed to Kansas, and inquire into and collect evidence in regard to the troubles in that territory, and particularly in regard to any fraud or force attempted or practised at the elections heretofore held. The Speaker appointed Campbell, of Ohio, Howard, of Michigan, and Oliver, of Missouri.

Kansas.—The Free State Legislature, in joint convention, had elected —— Reeder and —— Lane U. S. Senators. Each received 38 votes, out of 56 members present.

Utah.—The Mormons are taking measures preparatory to the admission of their territory into the Union. A general election was ordered to take place on the 16th of Second month, for the choice of delegates to a Constitutional Convention, which was to assemble at Great Salt Lake City on the 17th inst. This Convention was to be authorized to form and adopt a Constitution, to define boundaries, designate the name of the new State, and memorialize Congress in relation to its admission.

Pennsylvania.—The Committee on Banks in the House of Representatives, has made a written report against chartering any new Banks or Savings Institutions, or re-chartering old Banks which did not keep their notes at par in Philadelphia, and in favour of re-chartering all the well regulated old Banks, but restricting their circulation to notes of ten dollars as the lowest denomination. A bill has been introduced into the Legislature for the better security of life on board of ferry-boats.

Philadelphia.—Mortality last week, 198. As nearly as can be ascertained, *sixty-one persons* perished by the burning of the ferry-boat New Jersey, most of whom were residents in Camden. The investigations which have been made since the disaster, show that the boat had long been considered an unsafe one, and that it was unprovided with proper means of extinguishing fire. The City Commissioners report the number of taxable inhabitants in the twenty-four wards of the city, to be 94,731. The assessed valuation of real estate is $150,079,319. The assessed valuation is not more than two-thirds of the real value.

The Flour Manufacture.—Philadelphia contains twenty-eight mills, capable of grinding 14,000 bushels of wheat per day. The quantity of superfine flour made yearly, is nearly 900,000 barrels. Two additional mills are about being erected, which will increase the yearly manufacture to a million of barrels.

New York.—Mortality last week, 361. The steam propeller Arctic which left New York on the 11th of Second month, in search of the Pacific, returned on the 21st inst. to near Sandy Hook, and again put to sea. Nothing had been seen of the Pacific; no wreck nor trace of any kind was discovered during her cruise, between Long Island and lat. 37°. Some of the ships from Europe recently arrived, made very long passages. The Macaulay from Marseilles was 92 days at sea, and the Wisconsin from Havre, 71 days. The schooner Falmouth has been seized by the U. S. Marshal on suspicion of having been fitted out for the slave trade. She was going out of port when the seizure was made. The evidence furnished by her outfit, is said to be abundant and irresistible. It is believed that many vessels are fitted out at New York for this nefarious business, but they for the most part elude detection. The shipments of specie for the week ending the 22d inst., amounted to $856,281. The total, since First mo. 1st, to $3,643,837. On the 22d inst., sales of good white wheat were made at $1.81; red, $1.65.

Miscellaneous.—Restitution.—It is stated in Paris, that a demand is about to be made on the English government for the restitution of numerous archives, historical documents, and old manuscripts seized at Paris, in 1815, by Lord Wellington.

The Gipsies in Wallachia.—The General Assembly in Bucharest on the 7th ult., decided on the emancipation of the gipsies from Serfdom. The gipsy population in Wallachia is said to number 70,000.

Death of Biela.—The celebrated astronomer, Von Biela, died at Venice on the 19th ult., in his 74th year.

A New Test.—The Massachusetts Legislature has passed by the requisite two-thirds vote, one of the new amendments of the Constitution, which provides that any person who desires to exercise the right of suffrage, shall be able to read and write.

Emigrant Vessels.—The law passed last session of Congress, requiring the owner or consignee of passenger emigrant ships to pay $10 to the Board of Commissioners of Emigrants, for every passenger who shall die on the voyage, has, it is said, greatly reduced the mortality on shipboard.

Telegraphic Extension.—The Joint British, French and Sardinian Submarine Telegraph Company has completed its arrangements for continuing the line from coast of Africa, by way of Alexandria, Jerusalem mascus, &c., to Calcutta, whence it must ere lon extended to Melbourne, the British capital of Aust altogether a distance of 12,500 miles.

The Weather.—Up to last week, the roads all Canada, were nearly impassable on account of the drifts. On the Oswego and Syracuse (N. Y.) Rail the snow banks along the track were higher than tops of the cars. The Connecticut river was frozen nearly to its mouth, and was used as a highway betw Lynn and Hartford, 40 miles. On the 10th, the mometer at Bloomville, Delaware county, N. Y., st at 33° below zero.

Famine among the Indians.—The St. Paul Demo says that there is much suffering among the Indian Minnesota, especially among the Yanktons of the souri. They were not able to obtain the usual su of buffalo this winter, and they have had to suffer fi hunger, as well as extreme cold.

Florida Indians.—Complaints of their outrages tinue. It is stated that a band of them lately attac a white settlement, and killed four men, one wom and three children, at the same time burning th houses.

Shipwreck and Loss of Life.—The ship John Rutled from Liverpool for New York, with 120 passengers a crew of 25 men, was sunk on the 20th of Second m by collision with an iceberg. It is supposed all board have perished, except one man who was resc from a boat by a passing vessel.

RECEIPTS.

Received from T. and S. Stanley, O., $4, vols. 28 29; from W. C. Taber, Mass., $4.18, vols. 29 and and extra papers; from Joshua Macomber, N. Y., vol. 28.

WEST-TOWN SCHOOL.

The Committee charged with the oversight of th Institution, will meet in *Philadelphia*, on Sixth-day, t 11th of next month, at 7 o'clock, P. M.

The Committee on Instruction, and the Committee Admissions, meet on the same day—the former, 4 P. M., and the latter, at 5 P. M.

The semi-annual Examination of the Schools will o cur on Third, Fourth, and Fifth-days of the same wee in presence of the Visiting Committee.

THOMAS KIMBER, Clerk.

Philad., Third mo. 29th, 1856.

HAVERFORD SCHOOL ASSOCIATION.

The stated annual meeting of the Haverford Scho Association, will be held at Committee-room, Arch stree Meeting-house, on Second-day afternoon, at 4 o'clock Fifth mo. 12th, 1856. CHARLES ELLIS, Sec'ry.

A Stated Meeting of "The Association of Friends fo the Free Instruction of Adult Coloured Persons," wi be held on Fifth-day Evening, Fourth month 3d, 185 at 8 o'clock, in the third story room of Friends' Book store, No. 84 Arch street.

Members of the Association and others interested, wi please attend.

CHARLES J. ALLEN, Sec'y.

Friends' Boarding-School for Indian Children, at Tunessassah.

A man Friend is wanted to aid in carrying out th concern for the improvement of the Indians.

Application may be made to JOSEPH ELEINTON, 377 S. Second street
THOMAS EVANS,
Philad., Eleventh mo. 1st, 1855. 180 Arch street

MARRIED, On Fifth-day, the 28th ult., at Friends Meeting-house, Evesham, Burlington county, N. Jersey SAMUEL WOOLMAN and MARY H. ROBERTS, both of thi city.

DIED, on the 29th of Eleventh month, 1855, at he residence in Moorestown, N. J., NAOMI ROBERTS, widow of Isaac Roberts, in the 72d year of her age; an es teemed member of Chester Monthly Meeting.

——, on the morning of the 12th of First month, a the residence of Hannah Smedley, in Edgemont, Delaware county, RACHEL LAMBORN, of West Chester, in th 69th year of her age; a member of Birmingham Monthly Meeting.

Selected for "The Friend."

Memorial of William Rickman.

ur dear friend, William Rickman, was permitto see many days, attaining the 94th year of ge. He was a dedicated follower and servant esus Christ, and was, especially during the r part of his life, a diligent labourer in the 's vineyard.

hilst young, he was taken to America, and d as an apprentice at New York. Here he favoured with a precious sense of divine visin, and so far yielded to the converting power love of God as to become conspicuously de l to uphold the cause of truth, and to promote eaceable kingdom of the Redeemer. But, for of abiding in a state of humility, and in a hful dependence on the preserving influence e Holy Spirit, he was beguiled from that way ace into which his feet had been so mercifully d: and, by little and little, he became, gh disobedience to the divine law, despoiled s spiritual armour, and left defenceless, a prey e cruel adversary of souls, who betrayed him a long course of transgression and sin. In state of awful alienation from the fountain of he was not forgotten by him whose compass- fail not, but was at length brought under a sense of his undone condition: misery and ish of heart were his portion, and, for many hs, his distress was so great, that he had no of ever again being restored to the favour od. After a season, which he has described e of utter darkness and despair, his heart me, in some degree, broken and contrited; he was enabled to look upward in hope of forness: and continuing patiently to endure the ments of the Lord for sin, he was brought, gh the tender compassion of a gracious Sa-, to the enjoyment of that peace, to which his had been long a stranger. In commemoraof the mercy thus renewedly extended to him, equently, even until near the conclusion of engthened life, has been heard to extol and nify that grace which had wrought for him marvellous redemption; often repeating those ssions of the royal psalmist:—"He brought p out of an horrible pit, out of the miry clay, et my feet upon a rock, and established my gs. And he hath put a new song in my h, even praise unto our God."

e left America in 1785; in the year following to reside at Rochester, and was engaged as a er in a school. He was acknowledged as a ter in 1793. In 1788 he married Elizabeth nder, the daughter of the Friend whom he had succeeded in the school. In his frequent religious visits, she cheerfully gave him up to the service of his great Master, and peacefully departed this life in 1832, aged 73 years.

William Rickman was often led, by the drawing of gospel love, to visit his friends as a minister of Christ. In this character he was twice extensively engaged in Ireland, and once in America; he also visited the meetings of Friends, and frequently the families composing them, in many parts of England, Scotland, and the islands of Guernsey and Jersey; also those who profess our principles in France: and there is good reason to believe that these labours of love were generally acceptable and edifying.

He was a very diligent attender of our meetings for worship and discipline, even until a very short time previous to his decease, and when in so feeble a state of body, that his friends were apprehensive his strength would scarcely enable him to bear the exertion.

Though not of a robust constitution, he was favoured with good general health, and was remarkably preserved from the pains and infirmities which are the common attendants of old age; and for this blessing he frequently expressed his thankfulness. He was kind and charitable to the poor, a sympathising friend and counsellor; and he frequently visited those who were labouring under affliction either of body or mind.

As our dear friend drew towards the close of his long life, his concern for the prosperity of the church increased, and his love to his friends, and good-will to every one, flowed abundantly; so that we may, respecting him, adopt the language, "The path of the just is as the shining light that shineth more and more unto the perfect day."

In the early part of the year 1837, he was greatly reduced by an attack of illness, and to himself, as well as to those around him, it appeared improbable that his feeble frame would struggle through it. At this time, speaking of the uncertainty of his continuance here, he said, "I desire to be entirely resigned to the Divine will. I have nothing of my own to trust to: nothing but the mercy of God in Christ Jesus, who died for me and all mankind."

From this illness he recovered, though he never regained his former strength; and towards the summer of 1839, he began rapidly to decline.

To a relative who paid him a visit, he said, "I have been in a very low state, greatly tried and tossed for a long time; but this promise was brought to my remembrance—and O! the comfort it has been and is to me!—'O thou afflicted, tossed with tempest, and not comforted! behold, I will lay thy stones with fair colours, and thy foundations with sapphires,'"—"The Lord has been with me all my life long, from youth to old age, and he will not leave me, now that gray hairs are come upon me. My many sins of omission, and commission too, he hath forgiven them all. What a poor creature I have been!—nothing in myself—no, nothing: it is all of mercy, free grace and mercy."

For some months previous to his decease he was almost entirely confined to his bed, and his weakness was so great, that he often appeared to be nearly exhausted: there were, however, intervals when his spirit was so raised above the infirmities of the decaying tabernacle, that he appeared unable to finds words to express his sense of love and gratitude to his heavenly Father, for the many mercies of which he was made a partaker. On one occasion he said, "O, the love of God in Christ Jesus our Lord! it is inexpressible! O, his condescension to poor, weak, fallen man!—wonderful to think that the beloved Son of God should leave the bosom of the Father, and his glory in heaven; that he should take upon him our nature, and be made like us in all things, sin excepted!" He then recounted the principal circumstances in the life of our blessed Saviour, pausing at intervals, as if to dwell on the sacred theme, and intermingling occasionally prayer and praise. At another time he said, "I am passing away—nearly done with all below. This frail tabernacle will, ere long, become united to the dust! but if preserved unto the end, I believe that, through redeeming love and mercy, my soul will mount up as on eagles' wings, and will join that innumerable company of saints, and angels, and archangels, who surround the throne; there to unite with them in ascribing glory, thanksgiving, honour, and praise, to the Lord God and the Lamb forever and ever. Alleluia!"

The following morning, being asked how he had passed the night, he said, "O! so comfortable, so peaceful, so peaceful. The Saviour is very near, very precious. He has followed me all my life long, and in mercy borne with my backslidings. He was bruised for our iniquities, he was wounded for our transgressions. Oh! the love and mercy of the Lord to me; they are inexpressible! I am passing away so gently: my body will soon be in the silent grave; but I have faith to believe there is in me an immortal part, which will dwell forever in the presence of the Lord; and I believe, that through the mercy of God in Christ Jesus, my many short-comings and backslidings—my multiplied transgressions, are forgiven. Surely goodness and mercy have followed me all the days of my life—yes, all the days of my life. I do believe that a brighter day will dawn upon the church, and upon our Society. The knowledge of the Lord shall cover the earth, as the waters cover the sea. His kingdom shall be exalted, and his dominion be over all forever."

About two weeks before his death, he called one of his daughters to him, at an early hour of the morning, and said to this effect:—"What a refreshing sleep I have had! it has felt to me, as though my soul was in heaven. I seem to have heard the sound of angels and archangels. Thou knowest I have had a severe conflict, a low season, but it is very different now. What a favour!"

An evening or two preceding his final close, as his daughters were by his bed-side, he raised himself up, and said with a clear and audible voice, "Farewell in the Lord, and in the power of his might." He gradually became weaker, till he gently and calmly ceased to breathe, on the 29th of the Seventh month, 1839, in the 94th year of his age.

The Expedition for Camels.

The *Washington Star* says:—We have been favoured with a copy of a letter from Major Wayne, United States Army, the officer in charge of the expedition of this government to procure camels to be brought hither with a view of experimenting for their future employment in United States military transportation, especially on our great Western deserts. It is as follows:

Constantinople, Oct. 31st, 1855.

Sir—In accordance with my report of the 11th of October, Lieutenant Porter and myself left this for Balaklava the next day, the 12th, in the British transport steamer, the Imperador, and landed in the Crimea on the 17th. Calling on Major Ross, the Deputy Quartermaster General at Balaklava, and further to the front, on General Simpson, the commander of the British forces, we received from these gentleman kind welcome, and every facility for the prosecution of our duty was promptly afforded to us. I was further fortunate in receiving an introduction to Colonel McMurdo, in charge under the Quartermaster General, General Eyre, of the land transport service in the Crimea, and who, as Quartermaster General to General Napier in the expedition against Sinde, had used camels extensively for military purposes. He gave me much interesting information in relation to the military use of the camel, and from General Simpson, also, who had served in the same expedition under General Napier, we had additional accounts of the value of the animal, and of the favourable opinion entertained of it by the army for the services it was capable of rendering. The engagements of Colonel McMurdo were such that I could occupy but little of his time, and in consequence obtained from him only a few material facts without going into details. My thanks are due to him for the moments he devoted to me, pressed as he was with the many and various duties of his position.

We found in the Crimea both the Bactrian, two-humped camel, and the Arabian, or one-humped; but the latter alone seemed to be used for the purposes of military transportation. The former were found in the Crimea, at the commencement of the war; the latter were carried there since from Asia Minor. The former were but little thought of, the latter were highly esteemed; the only objections to them we heard of being the room they occupied in the narrow streets, and their frightening the horses. The two are very distinct species of the same genus; differing from each other as much, I should say, as the buffalo of our western prairie does from the common ox. Doubly humped, the Bactrain is a strongly built, powerful animal, standing not quite so high as the Arabian, of coarser and more shaggy coat, slower in motion, but capable of carrying immense burdens.

From the formation of its back (its two humps) there is a difficulty in adjusting to it a pack saddle, and without one there is always more or less perplexity in loading and securing the load. This I rather think is the principle source of objection to its use, though I believe the opinion advanced to us to be correct that it is not as serviceable an animal as the Arabian. Its use in the Crimea before the war we understand to be chiefly for draught, and on one occasion we saw two yoked to a Tartar wagon, as oxen are, but guided by rope reins. The result of our examination determined us not to procure one, as it would only complicate our experiment without producing such results as we anticipated from Arabian stock. At some future day, should the camel become domesticated with us, it may then be worth while to import a few males for crossing with the Arabian females, as it is said is done with advantage in Persia, the issue always taking after the mother—this is, being one humped. Sketches of the Bactrian camel were made by — Heap, which will convey very clear ideas of the animal and its difference from the Arabian.

Colonel McMurdo informed me, that in the expedition against Sinde, he had in service about twenty-five thousand camels, and that from his experience he esteemed them highly; so much so, that he had then at Sinope three thousand of them, in addition to the few now in use, in the Crimea, in readiness for the campaign next spring. The loads they will carry depend much, he said, upon the service in which they are employed—rapid movements naturally requiring light burdens—but their average loads, under favourable circumstances, he stated to be about six hundred pounds, and these they will carry easily, without pushing, twenty-five to thirty-miles a day. He mentioned the interesting fact, which I do not remember to have heard before, that during the expedition against Sinde, General Napier organized a most efficient corps of 1000 men, mounted upon 500 dromedaries—two men to each dromedary—the men sitting back to back, one facing the head, the other the tail, and both armed with rifles and sabres. The man facing the head was the animal's groom and driver, and the manner of using the corps was as follows:—Upon arriving at the scene of operations the dromedaries were made to kneel, in square, under charge of their five hundred drivers, forming, as it were, a base of operations, from which the other five hundred operated as infantry. As the advanced body moved, the square, or squares, if more than one was formed, if required, were also moved, and in case of extremity, the square offered a cover under which the one thousand men could find comparative shelter behind the animals, who were prevented from rising by a hobble on the fore leg, and use their rifles most effectively. This corps, Colonel McMurdo informed me, could be readily marched seventy miles in any direction in twelve hours, ($5\frac{2}{3}$ miles per hour,) and rendered throughout the campaign most efficient service

General Simpson stated that in the same campaign he found the camel so serviceable that he procured five or six for his personal use, and that with them he frequently went seventy miles between sunset and sunrise. To a direct question by Major Delafield, (whom we met in the Crimea,) whether he would not have preferred the best English horses to camels, could he have obtained them, the General answered no, that he would have preferred the camel, as packing his baggage upon them in light loads, he could move more quickly and continuously.

In relation to our visiting Persia, the inquiries we have made lead us to the conclusion that, though we might readily get there, our return, owing to the blocking up of the roads by snow, would be impossible until next spring. As this would detain us much beyond the time fixed for our return to the United States, and unnecessarily delay the experiments we are engaged in, we have reluctantly abandoned the journey, though we desired much to see the varieties of the Persian camel, and particularly the Leurbourek or dromedary artillery.

A journey into Persia, with the intention of returning immediately, must be commenced, we find, about May. Our course from this will be, I think, to Syria or Egypt, for dromedaries, and then back to Smyrna for burden camels, in the expectation of commencing our return home some time in February.

The inquiries in relation to dromedaries for the French army, reported in my letter of the 11th of October, produce no result. Very respectfully your obedient servant,

HENRY C. WAYNE,
Major United States Army.
Hon. Jefferson Davis, Sec'y of War.

Epistle of George Fox.

There were about this time several Friends in prison, for bearing testimony to the truth, to which I was moved to write a few lines, to comfort, strengthen and encourage them in their sufferings, having a true sense of their sufferings upon the spirit, sympathizing with them therein. That which I wrote was after this manner:—

My dear Friends,—Who are sufferers for the Lord Jesus' sake, and for the testimony of truth; the Lord God Almighty with his power uphold and support you in all your trials and sufferings, and give you patience and content in his will, that ye may stand valiant for Christ, and for truth upon the earth, over the persecuting and destroying spirit, which makes to suffer in Cain (who bruises his head,) in whom ye have the election and salvation. For his elect's sake, the Lord hath done much from the foundation of the world, as may be seen throughout the Scriptures of truth. They that touch them, touch the apple of God's eye; they are so tender to him; and therefore it is good for all God's suffering children to trust in the Lord, and to wait upon him: for they shall be as Mount Sion, that cannot be removed from Christ, their rock and salvation, who is the foundation of all the elect of God, of prophets and the apostles, and of God's people now, and to the end. Glory to the Lord and the Lamb over all! Remember my dear love to friends, and do not think the time long; for the time is in the Father's hand, his power. Therefore, keep the word of patience and exercise the gift; and the Lord strengthen you in your sufferings in his Holy Spirit of faith. Amen. G. F.

Swarthmore, the 5th of the Twelfth mo., 1678.

About Manure Sheds.—As a general thing we think we farmers do not attach sufficient importance to housing our manure. It ought to be done in every case, unless it be where we have large quantities of coarse litter, which needs to become decomposed in a measure, before it is applied to the soil. In this case it might be in an open yard, where it would be exposed to the falling rain and the atmospheric influences. But in every other case it no doubt pays largely to erect shelter, especially to protect the manure heap. A cou which I have seen practised where there has b no manure cellar is this:—Instead of throw the contents of the stable directly out of the d or window, to form an unsightly pile, take a wh barrow into the stable, and wheel the manure i the cow-shed—for it is taken for granted ev farmer has an establishment of this kind appen to his barn-yard—and then every day or two le down with the fork, and scatter over it suffici litter to make it comfortable for your stock. *Rural New Yorker.*

The mother of Wesley charged her son "Whatever weakens your reason, impairs the derness of your conscience, obscures your se of God, or takes off the relish of spiritual th —in short, whatever increases the strength authority of your body over your mind, that thin *sin* to you, however innocent it may be in itse

No earthly possessions—no mental endowme can supply the place of religion—because alone brings salvation to man.—*Marsh.*

For "The Friend."

t is no uncommon thing for licentious persons, others who have rejected the offers of Divine ce, to ridicule the very simple course of life, in ch the Saviour sometimes leads his followers. conscientious scruples which their Lord lays n them, in some instances designed especially umble their proud spirits, may not be under- d at times even by others of his disciples, and chfulness on their part is necessary to guard inst making the substance of religion to consist those outward things, and censuring their nds who are not led in those respects as they

At the same time it is needful their friends uld have the spirit of discernment, and charity keep them from lightly speaking of the pecu- scruples of honest and faithful ones to their ouragement, and lessening the cause of pure undefiled religion. Many have probably heard anecdote of two persons, intently conversing n the supposed scruples of certain individuals, hich some invidious remarks passed, deroga- y to their pretensions. A female minister sit- g by, unobserved by them, after hearing the idom of their observations, it is said, remarked k in weighing flour or other common articles, a iple would be easily overlooked; "but in the nce of the sanctuary, a scruple is a scruple."

On the other hand it is well to remember, that se who apprehend themselves called into great rees of self-denial in some outward things, e need to guard against the subtle deceptions the serpent, who may lead them to make con- nce of what the Lord has not required of them. different ages of the christian church, some who partially submitted to conviction, have run o great extremes. At Rotterdam, William Ca- was much distressed in meeting with certain ividuals, who had been convinced of Friends' ciples by his ministry, but who ran out into l notions, while under the name of Quakers, h in conversation and in writing. Sewell aks of such persons whom he knew; and he seen books they printed, in which, under pre- ce of plainness, not one capital letter was to be nd, even to the name of the authors. After y had gone into many extravagancies, it was to be wondered at, he remarks, that the ma- rates shut them up in Bedlam. J. Furnier, ir leader, lived as another Diogenes, using at fire a split stick instead of tongs, and in con- sation, he made it a piece of holiness to use the st blunt language he could think of, however urd or unsuitable it might be. Finally his ex- ses induced the orthodox Quakers to reject him. ell says that Dr. Galenus told him that this n coming to his door, and finding the doctor's oe on the post as usual, he scratched out h his knife the letters Dr., and when asked y he did so, pretended the authority of the rit for the act. He was a passionate man whom ends could not own, though he had translated ny of their books into the Dutch, and would undertake preaching. At length he assumed ther profession, and fell into a dissolute life. r early Friends must have had many difficul- s to endure on both hands; often none being re positive of the rectitude of their ways and nions, and unwilling to hear admonition, than se who have been thus misled and clouded. e place of preservation is humility, walking in fear of the Lord, and true self-denial, and a per respect for the judgment of others.

It is no easy thing for those who are collected ether for Divine worship, to say, as Abraham d to his servants when he arrived at the foot of mountain where he was ordered to sacrifice his son Isaac, "Stay here whilst I go up into yonder mountain to worship the Lord;"—to say to the hindering things of time, Stand aside; even though we may have pressed through many difficulties to get to the meeting.

Pearls and Pearl Making in China.

The following information respecting the method adopted by the Chinese, for facilitating and shaping the growth of the pearl in the pearl oyster, is communicated to the Journal of the London Society of Arts by Dr. Macgowan:

The practice of the art is confined to two conterminous villages near the district city Tehtsing, in the northern part of Chihkiang, in a silk producing region. In the mouth of May or June large quantities of the mussel (mytilus cygnus) are brought in baskets from the Tahu, a lake in Kiangsu, about 30 miles distant, the largest among the full grown being specially selected. As their health suffers on the journey they are allowed a few days respite in bamboo cages in water before being tortured for the gratification of human vanity, when they are taken out to receive the matrices. These are various in form and material, the most common being pellets made of mud taken from the bottom of water courses, dried, powdered with the juice of the camphor tree seeds, and formed into pills, which when dry, are fit for introduction into the unfortunate subject. Moulds which best exhibit the nacreous deposit are brought from Canton, and appeared to be made from the shell of the pearl oyster; the irregular fragments thus procured are triturated with sand in an iron mortar until they become smooth and globular. Another class of moulds consists of small images, generally of Buddha, in the usual sitting posture; or sometimes of fish. They are made of lead, cast very thin by pouring on a board having the impression. Pearls having these forms have excited much surprise since they first attracted the attention of foreigners a few years back.

The introduction of the pearl nuclei is an operation of considerable delicacy. The shell is gently opened with a spatula of mother of pearl, and the free portion of the mollusc is carefully separated from one surface of the shell with an iron probe; the foreign bodies are then successively introduced at the point of a bifurcated bamboo stick, and placed in two parallel rows upon the mantle or fleshy surface of the animal. A sufficient number having been placed on one side, the operation is repeated on the other. Stimulated by the irritating bodies, the suffering animal spasmodically presses against both sides of the testaceous skeleton, keeping the matrices in place. This being done, the mussels are deposited one by one in canals, or streams, or pools connected therewith, five or six inches apart, at depths of from two to five feet, in lots of from five to fifty thousand.

If taken up a few days after the introduction of the mould, these will be found to be attached to the shell by a membranous secretion which, at a later period, appears as if impregnated with calcareous matter; and, finally layers of nacre are deposited around each nucleus, the process being analogous to the formation of calculary concretions in animals of a higher development. A ridge of marl generally extends from one pearly tumor to another, connecting than all together.

About six times in the course of the season, several tubs of night-soil are thrown into the reservoir for the nourishment of the animal.

In November, the shells are carefully collected by the hand, the muscular portion removed, and the pearls detached by a sharp knife. If the basis of the pearl be of nacre it is not removed, but the earthen and metallic matrices are cut away, melted yellow rosin poured into the cavity, and the orifice artificially covered by a piece of mother-of-pearl. In this state, these more than semiorbicular pearly pellicles have much of the beauty and lustre of the solid gem, and are furnished at a rate so cheap, as to be procurable by all who care to possess them. They are generally purchased by jewellers and others, who set them in tiaras, circlets, and various ornaments of female attire. Those formed on the image of Buddha are finished in the same manner, and are used as ornaments and amulets on the caps of young children. A few shells are retained, with their adhering pearls, for sale to the curious or superstitious, specimens of which have, by this time, found their way into the principal public and private cabinets of Europe and America. They are generally about seven inches long and five broad, containing a double or triple row of pearls or images, as many as twenty-five of the former and sixteen of the latter to each valve. That the animal should survive the introduction of so many irritating bodies, and in such a brief period secrete a covering of nacre over them all, is certainly a striking physiological fact. Some naturalists, indeed have expressed strong doubts as to its possibility, supposing the pearls were made to adhere to the shell by some composition, but the examination of living specimens in different stages of growth, having both valves studded with pearls, has fully demonstrated its truth. A tinge of yellow is found over the whole inner surface of some shells, showing that the more recent secretion of nacre by the suffering animals was unnatural; the flesh of all, however, is eaten.

Above five thousand families are represented as being engaged in this singular branch of industry in the villages of Chungkwan, and Sian-changngan; they, however, mainly derive their support from cultivating the mulberry, and in rearing silkworms, and other agricultural occupations. Those who are not expert in the management of the shells lose 10 or 15 per cent. by deaths; others lose none in a whole season.—*From the Annual of Scientific Discovery for* 1856.

Action of the Cold on Railroad Machinery.—The cost of a heavy snow storm or very cold weather upon a long railroad is very considerable, not only in detentions, but by the action of the frost upon the machinery, in breakage, &c. Our roads in this quarter have all suffered more or less, lately, from this cause, but those further north have, we should think, a much more costly experience in the same way. The superintendent of the New York Erie work shops at Susquehanna reports the beginning of this week that he had never known so hard a week upon iron, in his life. It has been with great difficulty, and by working a large force of men several nights, that he could keep the road supplied with power. Something like a dozen locomotives were brought in disabled —some with pumps frozen up and bursted; some with side rods broken; some with cylinders bursted; but the greatest difficulty was in the broken tires of wheels. These are of the best wrought iron, over two inches thick, but they were not sufficient to withstand the difference of contraction between the cast iron centres and the wrought iron bands, upon a frozen road, where all elasticity was congealed to rocky solidity. The breakage of axles, wheels, rails, and in fact all the stationary or moving iron, has required a most untiring vigilance, and an extraordinary expense.

Sickness is intended to teach us what a vain thing the love of the world is,—what a vile thing sin is,—what a poor thing man is,—and what a precious thing an interest in Christ is.

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 1:8.)

HANNAH HILL.

Hannah Lloyd, daughter of Thomas and Mary Lloyd, was born at Dolabran, in North Wales, (the family sent of her paternal ancestors,) on the 21st of Seventh month, 1666. Her mother was the daughter of Gilbert Jones, of Welsh Poole. Hannah possessed many natural gifts and talents, and early in life submitting to the Lord's humbling and enlightening visitations, she became qualified for usefulness in the church of Christ. Her parents removed to America, when she was but sixteen years of age. Soon after their arrival, her pious mother being removed from them by death, the care of the younger members of the family, very much devolved upon Hannah. This sorrowful dispensation was doubtless attended with blessings to the young care-taker, who was thereby driven to seek wisdom of him, who dispenseth spiritual blessings, as well as enlargeth the natural gifts of those who wait on his teachings, and faithfully follow his leadings. The "memorial" of her says, "Her mind was earnestly engaged to seek the Lord for her portion, and her father's God for the lot of her inheritance. He was graciously pleased not only to favour her with the knowledge of himself, and the enjoyment of his living presence in the days of her youth, but also made her a singular instrument of good, and a blessing to her father's family. As she grew up into years, her conspicuous virtues joined with a courteous deportment justly gained the esteem and favour of most, if not all, with whom she conversed."

The residence of her father was for several years in New York, and there she became acquainted with John Delavall, a merchant of that city, a worthy man and religious, but one not convinced of the principles of Truth, as held by Friends. He became attached to her, and very earnestly sought to win her affections and her hand. His efforts were unavailing, until after some time, being convinced of the Truth through the gospel labours of Thomas Musgrave and Jonathan Tyler, he was received into the Society of Friends. "Her prudent conduct and pious resolution to maintain the principles she professed, without deviating therefrom in a matter of this importance," doubtless but endeared her the more to him, when he himself had learned to regard that principle as the safe guide and preserver of the Lord's children. Having, in sincerity of heart, embraced the Truth, he found that his way was opened with her, and in true love, and with the unity of their friends, they were married at the house of John Bowne, at Flushing, Third month 31st, 1686.

Her husband was soon called to the work of the ministry, and became eminent therein. He was, indeed, one of the worthies of that day, sound in the faith, faithful in the maintenance of the Truth, and living under its humbling, restraining influence in his walks amongst men, and in his family. About the early part of 1690, they removed to Philadelphia, where they continued to reside during the remainder of her days.

George Keith was at this time beginning to develop his new doctrine, and to put on airs of superiority over his old Friends. Thomas Lloyd was one of the principal objects of his attacks, as having more influence in the Society, more weight in the Truth, than George had. John Delavall was brought into collision with George, and although George admitted that John gave true Quaker doctrine, and true christian doctrine, yet that did not shield him from a portion of abuse.

The summer of 1693 appears to have been sickly in Philadelphia, and death made serious inroads into the family and family connections of Hannah Delavall. On the 10th of the Sixth month, her husband was taken from her, and six weeks after her only child. Between these most poignant bereavements, six other of her kindred deceased. Of her husband, she testified that "he never used to her an expression of anger, or the product of a disturbed mind." This was a season of deep affliction to Hannah, but her friends testify that throughout these trials, as well as many others which attended her earthly pilgrimage, "she proved herself a shining example of patience in tribulation, and a meek, humble, self-denying follower of Christ."

In the year 1694, Hannah Delavall lost a beloved father, the church an eminent pillar, and the commonwealth a useful citizen, in the removal of Thomas Lloyd to his everlasting reward. For the few following years, we lose sight of Hannah Delavall; only we are told that she was busily engaged in works of charity, making use of the income with which she was favoured, in benefiting the poor, and relieving their distresses.

In the Eighth month, 1700, Hannah Delavall was united in marriage to Richard Hill. He was born in Maryland, but as a merchant, had resided some time in London, where he was in the Sixth mo., 1699. From the Two Weeks' Meeting in that place, he brought a certificate of his clearness on account of marriage, to Philadelphia Monthly Meeting at the time of his obtaining liberty to proceed to accomplish his engagement with Hannah Delavall. He was a valuable man, of good natural ability, and of religious worth.

At what time she came forth in the ministry, we have no account; but in the year 1704, she is first mentioned in the meeting of ministers in Philadelphia, after which traces of her attendance of meetings were frequent. Her memorial says, "In her younger years she received a gift in the ministry, which she retained with faithfulness to the end; and though not large in her appearance, yet with great modesty and soundness of expression, 'Her doctrine dropped as the dew, and distilled as the small rain,' and was, therefore, truly acceptable. She travelled in the service of the gospel, to New England and divers other parts of this continent, and was also concerned for the good order and discipline of the church, having for a number of years, served in the station of clerk of the Women's Monthly, Quarterly and Yearly Meetings, wherein she gave satisfaction."

We need not trace this beloved Friend in her labours of love in the church militant. She was not one who travelled much from home, but there is abundant evidence of the great esteem in which she was held as a minister of the gospel, and a faithful and devoted servant of Christ. She was the first woman representative appointed to the General Meeting of Ministers, and it was six years before the practice thus set by Philadelphia Quarterly Meeting of Ministers, was followed by any other branch of this Yearly Meeting. The first appointment was in the First month, 1718.

Of her walk in private life, her memorial says, "In the affluent station wherein Divine providence had placed her, her benevolent disposition was conspicuous in administering to the necessities of the indigent, her charity not being limited to those of her own profession. She was a true servant of the church, and in the sense of the apostle's expressions, 'One that washed the saint's feet,' receiving with joy into her house, the ministers and messengers of the gospel, for whom her love was great. The low, the poor and the mean, were jects of her peculiar care."

During the latter part of her life, she was tended with bodily weakness, yet her love for everlasting Truth, and zeal for its support and crease on the earth, did not abate. She had perienced it to be a comfort to her own soul, seasons of affliction and trial, and she would t others also might, through obedience ther taste and see that the Lord is gracious. She tended the Quarterly Meeting of Ministers, h on the 4th of the Twelfth month, 1726. T same day it appears she was taken ill, and it s appeared that it was likely her dissolution was far distant. During her decline, she made m seasonable remarks, signifying her acquiesce with the Divine will, in the dispensations of providence to her, quoting the words of the ap tle, "No chastening for the present seemeth to joyous, but grievous; nevertheless, afterward yieldeth the peaceable fruit of righteousness u them, which are exercised thereby."

This was her own happy experience. After well spent life, in which she had witnessed ma exercising vicissitudes, she was enabled, thro the mercy of God in Christ Jesus, to exchange earthly existence, with its certain trials and certain joys, for a blessed immortality of abou ing felicity in heaven. Her death took place the 25th of Twelfth month, 1726, in the 6 year of her age. Her body was attended to grave by large number of Friends and others, meeting having first been held in the High str Meeting-house, in which divers living testimon were borne.

Thomas Chalkley, writing of the winter of 172 as a sickly time, says, "Among many that we taken away by death, were some few of my par cular friends, and first, dear Hannah Hill, who w a bright example of piety and charity; she w like a nursing mother to me in my afflictions, a her husband was more like a brother than one n related, whose generous entertainment I may n forget."

(To be continued.)

A Missouri Farm.

John Sigerson and Brother, of Missouri, have ch lenged the whole Union to produce a farm whi equals theirs in the variety and amount of produ tion, and extent of surface cultivated. Their far is situated seven miles south of St. Louis, and h been in cultivation less than ten years. It w thus described by a correspondent of the *St. Lou Democrat* several weeks since :—

"Statistics will better show its proportions th elaborate descriptions of scenery. Four hundr acres of pasture, grove, and lawn—one hundred ar fifty acres of meadow, eighty of wheat, sixty fi of oats and rye, corn and potatoes enough to su ply the numerous family and stock—nine miles Osage orange hedge, well trimmed, and much it large enough to turn cattle, adds much to th picturesque beauty of the rolling prairie, enclosin pastures, orchards, nurseries, flower-gardens, ar fields—a verdant net-work binding all togethe protecting and ornamenting at the same time There are two hundred acres of orchard just com ing into vigourous usefulness—eight thousan peach and apricot trees, and from present appea ances, some of them will give many a rich treat er the wintry winds sweep over us again. Pea apple, plum, and cherry, bear swift witness of th 'good time coming.'

"Twenty-five acres of strawberries have alread given our St. Louisians a foretaste of the future and dozens of men are now engaged replacing th old beds, and enlarging them by the acre. Thre

lred thousand grape cuttings have been set out spring, and most of them are doing well; forty sand evergreens in fine and fresh condition; hundred and ten thousand quince-trees are y for the budding of pears; twenty bushels of h stones, and seven bushels of apple-seeds have season been planted, and acres are covered the uprising life. A great variety of forest s are cultivated for the market, and it would be r, perhaps, to tell what the Sigersons have not, is indigenous to this climate, than to enume- what they have.

The substantial stone farm-house is surrounded large door-yard, which is reached from the e road by a serpentine road through a wooded n. A semicircle avenue, bordered by cedars, w-balls, and lilacs, leads to the door, where kind pitality and a farmer's welcome meet the num- s visitants that, through the summer months, ng the place to breathe the fragrant air, and riate for a brief hour in the beauty and flowers. terres of choice flowers, nurseries of roses, blos- in the sun by the half acre. Borders, walks, mer-houses, arbours, vines on every hand, in agnitude or magnificence that keep you all the le in wonder and admiration, form a whole that t be seen to be appreciated, and has seldom, if r, been surpassed. The whole stock of trees, ubs, vines, and evergreens, numbers two mil- s. (J. Sigerson says it is nearer three millions, he puts it down at two millions, lest the incred- is should be frightened by its vastness of num- and set the whole down as a fable.)

We spent two and a half hours riding through grounds, and examining the fields, pastures, nards, lawns, meadows, garden, shrubbery— ed down into the wells, examined the spring, stone-quarry, saw the fine Durhams, the good es, listened and laughed at the proud guttural r of Monsieur Shanghai, heard Madame Poland kle, and returned convinced that we have not n all, and that no one can truly realize the ex- of the farm, or its high state of culture, and labour and expense necessary to keep it in gress, that has not taken a ride through its ly drives, its bordered avenues, and hedged s."

From Old Humphrey's Portfolio.

The Old Man on the Ridgy Point.

ee, yonder the old man comes again, with his k, picking his way along the ferny, broken and of the High Downs. He is a stranger to place, and has perhaps come here for his health; walks about alone. I have met him on the h, where the billows fling their foam on the gles; in the solitary glen, and the retired lane, ays by himself, always musing. I saw him erday, and the day before, and the day before too; and I marked his thin gray hair, for the d was waving it, as I passed by. He looked n and thoughtful, but not melancholy. There that in the old man's face that set me think-

s he passed along the side of the Downs the time I saw him, the sun was setting beyond wind-mills, on the opposite hill; the old castle looked dark against the sky, and the fishers' fs lay motionless on the sea. The old man stood he Ridgy Point that commands a view of the val- and I thought he was looking at the setting-

he next time I saw him on the Downs, it was he same hour of eventide; but the sky was east, the wind had risen, the sea was rough, the fishing smacks were rudely tossed about he billows of the mighty deep. He stopped when he came to the Ridgy Point, and stood like a statue. I thought he was looking at the restless ocean.

Yesterday it was a little later when the old man came to his favourite spot, for the sun had set, and the ocean was hardly visible. Once more he took up his accustomed standing place, and fixed his eye intently, but I knew then that he could not be looking at the sea or the sun, "What can it be," thought I, "that draws him to the spot so constantly? What can it be on which he bends his eye so steadily?" When I walked near him, the truth flashed upon me at once.

For three evenings together, as I have already said, had the old man come to the same spot at nearly the same hour. He made no difference whether the sky were bright or gloomy, or whether the day were windy or calm. I wonder that he does not walk with the people on the parade, when the band plays; but no, he keeps to the High Downs.

In the valley below, and it may be about a furlong from the Ridgy Point, is a church with a grave-yard attached to it. The church is an ancient, gray, weather-stained building, that might almost pass for being a thousand years old. Both the tower and body of the antique edifice are roofed with red tiles, somewhat out of keeping certainly, but age, and moss, and revolving years, are beginning to make the tiles harmonize with the stone work. The church-yard is in two parts, with a row of large trees between them. It has hundreds of graves.* The old man was too much occupied to take any notice of me; he was looking at the grave-stones.

It might be that some friend of his was sleeping below one of the green hillocks or flat stones, and that the mouldering tenant of the tomb was rising in his remembrance. We do sometimes think affectionately of those who have been called away from the world, and especially if they have been very dear to us. Whether the old man was thinking thus, I cannot say.

Perhaps he was thinking that his own days were nearly numbered; and that there was "but a step between him and death." No doubt such thoughts do now and then come over the aged, with great power, and quite natural it is that it should be so; for what is our life? Truly, it is "a vapour that appeareth for a little time, and then vanisheth away." James, iv. 14.

An old man looking on a church-yard, must needs be enough to set him thinking of the past and the future. He sees how many have gone before him, and he feels how shortly he must follow them. Death may be as near the young as the old, though we are not apt to think so.

I should like to talk with the old man, and I will, if I can get a good opportunity, for there is nothing forbidding in his manner; but on the contrary, much that is kind and gentle. He is coming nearer now; but mark my words, he will turn off yet toward the church in the valley. The old man is thoughtful, as age ought to be; for

"Ill gray hairs become a jester."

See there, the old man has just come to the edge of the broken ground. I felt sure that he would make a pause; he is now standing on the Ridgy Point, almost as motionless as if made of stone, with his eyes fixed on the church-yard How I should like to know what is passing through his mind!

Though we can only guess at the old man's thoughts, we know well what are our own. The church-yard is before us, as well as before him; what then do we think of our latter end? Are we so living, that we may die the death of the righteous? Are we in time truly preparing for eternity?

* In this grave-yard have since been added the remains of Old Humphrey.

In the estimate of character look first for *grace*. Do not dis-esteem good people on account of their foibles or deficiencies in matters of little importance. Gold unpolished is far more valuable than the brightest brass. Never form unfavourable opinions of religious people hastily.—"Charity hopeth all things."

Mysteries in Nature.

Walk abroad, and behold the leafless tree. It asks thee, "Who ordained for me this quiet winter sleep, in which I can concentrate my powers and juices for fresh efforts in the summer?" The snow on the fields inquires of thee, "Who spread me out as a warm covering over the verdant seed, that the frost might not destroy it?" The frost itself asks thee, "Who was it ordered, that, when I lay hold on the water in brook, ditch, stream or lake, and partially transform it into crystal, they are obliged to part with all the warmth they possess, which passes into thy atmosphere, that I may not exceed the appointed decree, and destroy thee and all that has breath?" The sun in the firmament asks thee, "Who ordered it so wisely that, lest thou shouldst be consumed by my heat, I should, whilst warming the earth and the waters below, attract upwards the refreshing mist of the deep, and form over the earth the dripping arch of clouds?" The changing seasons, day and night, ask thee, "Who gave the dark planet which thou inhabitest the impulse to its wonderful revolution round the sun. Who ordered these revolutions in such an admirable suitability to all the need of the gigantic economy here below?" The rolling thunder asks thee from the heights above, "Who pervaded the firmament with those invisible electrophones, which always at the right time reanimate the torpid atmosphere which surrounds thee, and give it fresh elasticity?" The vegetation which grows and flourishes around thee in the great garden of nature asks thee, "Who imparted to our roots the impulse to bring forth seed, and enclosed in this seed the generating power, and the succession of our species?" And how many thousand similar phenomena ask the same question!

Tell me now: if all this was brought about by mere chance, how can you deny this chance the power of rational reflection? But the idea of a chance taking counsel with itself, is a contradiction and a mere absurdity. To the power which works, rules, and governs in the wide creation, can only be assigned the name of God. But listen farther; weigh the breath which proceeds out of thy mouth; after thou hast inhaled it, it becomes just so much heavier than the air around thee as is necessary, on being again exhaled, to make it sink down immediately and fructify the earth, and that which grows out of it. Rejoice that it is so; for know that the whole human family would soon inevitably wither away, and the earth become an immense charnel-house, if its inhabitants were compelled to inhale again, unmingled, the air which had once passed through the lungs. Measure the water which flows in the river and the brook. How fortunate that it is neither more compressed nor more fluid than thou findest it; for in the former case, it would mingle with elements, which would render it totally undrinkable; and, in the latter, it would forever separate the races of men from each other, for it could be neither sailed over, nor be fit to swim in. Examine the ground on

which thou walkest. Were it only a little firmer than it is, it would render the access of rain and dew to the roots of all vegetation so difficult, that the earth would soon become a barren waste, without bush or tree. Were it a little looser, it could no longer prevent the waters which stream from above, from gradually changing it into an all-absorbing morass.

From these few examples, to which thousands more might be added, you may infer that in the expansive economy of nature, not even the smallest thing could be altered without causing after destruction to the entire wondrous edifice. And shall these admirable arrangements which every where bear on their foreheads the impress of the most adorable wisdom, owe their origin to blind chance? What an innumerable multitude of fortunate throws must have been made? But how is it possible to think of chance where every thing testifies so obviously and sensibly to plain consideration and gracious provision? Men talk of the laws of nature, and we also speak of them and commend their wisdom. But who gave nature these laws? Laws always presuppose a lawgiver. Or wilt thou be like the man who, on inspecting a scientifically constructed machine, sought to find out the immediate cause of the revolution of all the wheels, and thought at last he had discovered it in one of the great wheels; instead of penetrating beyond them to the impelling steam-engine, and still farther to the machinist and inventor. Oh, what madness, to prefer explaining the so called laws of Nature as existing from all eternity, and repulsing the very natural question, "From whence have such laws derived their origin?" with the unsatisfactory reply, "That remains a mystery," rather than believe in a legislating, eternal, and infinite mind, exalted above these laws—a belief which is so unspeakably easy, and which so perfectly and satisfactorily solves the so-called mystery, that the Scriptures really do not go beyond the mark, when they reprove those who close their hearts against it, as fools and madmen."

For "The Friend."

Extract from the Life of Joseph Pike.

(Concluded from page 231.)

"Perhaps what I have said may by some be accounted a digression. I confess it is so, yet it may be instructive to you, my children, or to some others, in their progress heavenward, and indeed I find my mind drawn forth to make these digressions, as so many incentives to induce you to a right consideration of what steps you take, and that those you take may be consistent with the mind and will of God, that so in the end you may attain the crown of eternal life.

"This instance of my experience relating to marriage, may be accounted strange by such as have known little of the beginnings of the work of the Spirit upon their hearts; but what I have written, I have experimentally witnessed in this as well as in many other cases, that when the mind has been too much taken up, and agitated about lawful things, the tender Spirit of the Lord has brought trouble and condemnation upon me for it.

"When I was satisfied in my mind, as to the intended choice of my wife, I then felt bound in duty to acquaint my mother therewith for her consent, which she readily gave me. Then I acquainted her father, for his consent, which he likewise freely gave; upon which, I afterwards made suit to her, and in the end obtained hers, and the marriage was concluded to general satisfaction.

"And here also, I must leave some further counsel to you, my children and your children; that as you proceed in the fear of God in this most weighty affair of marriage, you will be directed to proceed regularly therein, according to Truth and right reason, and will make no application, nor receive any, until you have your parents' consent to proceed, who have both a divine and a natural right in your disposal. As it is irregular, so it is also unjust, where any do first apply to the young woman, and it hath often been attended with great trouble and disappointment, as dissent of parents, entanglements of affection, and many other inconveniences. * * * * I also believe, that most or all God's people, who at times have dominion in their minds, over lawful as well as unlawful things, have had, at other times, sufficient trials of their faith, patience, and love to their God, while he was pleased, as of old, to hide his face for a moment, and to suffer the enemy to tempt and buffet them, in order that they might see the frailty of their own nature; and, that, without his divine assistance, they are poor, weak, miserable creatures, and unable to perform anything, either in thought, word, or deed, acceptable to him; agreeably to the saying of our dear Lord and Saviour, Jesus Christ, to his disciples, "Without me ye can do nothing." In all times of weakness, temptation, and the Lord's withdrawings, we are patiently to wait on him, remembering, that no man, (not even the best of men,) by all his own strength, is able to help himself, or to do the least acceptable thing in His sight, nor preserve himself for one moment. It is man's duty to keep continually upon his guard, watching and praying against the enemy of his soul, until the Lord arise again, lest, as Christ said, we fall into temptation, from which none can be preserved, but by the Preserver of men, who is God, and our Holy Redeemer, the Lord Jesus Christ. * * * * *

"If parents rightly discharged their duty towards their children, it might go a great way, together with their own good examples, in making religious impressions upon them, as well as in influencing them to perform their duty towards their parents. But, through the failure of parents in both these respects, I believe thousands of children have been lost, out of which number I will not exclude many within the compass of our Society. Abraham, for his faithfulness, is called the Friend of God; and God gives this character of him, "I know him, that he will command his children and his household after him, and they shall keep the way of the Lord, to do justice and judgment." Gen. xviii. 19. And Israel was repeatedly commanded, diligently to teach their children, and to tell their sons, sitting down, rising up, in the house, and on the way-side, to keep the law of the Lord and fear him all the days of their life. David instructed his son to keep the law of God; and we find, on the other hand, though Eli reproved his sons, yet, because he did not restrain them, the judgments of God came upon him. A father was to train up a child in the way he should go; he, who truly loved his children was to chasten them betimes; and to bring them up in the fear, nurture, and admonition of the Lord, and to have them in subjection with all gravity. It most plainly appears, how great, how absolute, and how indispensable a duty lies upon parents towards their children, in order to their instruction in the way and fear of the Lord, by commanding, instructing, correcting, restraining, admonishing and keeping them in subjection from their childhood—all in due measure, time, and place, as the different occasions may require. But, contrary hereunto, I have observed two sorts of parents, who, by their own ill management, and not keeping their authority over, and discharging their duties to their children as by divine obligation they are enjoined to do, have ruined them with regard to all that is good. The first are such, who though they may be mor their own lives and conversations, and are n examples to their children, yet, by their fo indulgence, falsely called love, have thereby the very means of their ruin. A child may b unfitly compared to a young growing twig, e bent at first, but as it increases in strength comes less pliable, and when it is a great tre unbendable; and thus, most children when y may, by the godly care of parents, be traine very much as the parent pleases; or else, to purpose, were the above precepts given? Ba evil and folly are naturally bound up in the h of a child, so, that evil nature, not being kept d or restrained by an indulgent parent, gradu grows stronger and stronger, and in the end comes past bending, and rules. Thus, I h with sorrow, seen some foolishly indulgent pare who were so blind as not to see faults in their dren, or if they did see them, through exces indulgence, would not restrain them, which in end has proved their ruin. No wonder the such parents should lose all authority over t children, as well as such children disregard t parents, for want of keeping them in due sub tion, as soon as they attain to any degree of un standing, which they will soon do, to discern t parents' fondness. And, when too late, those v parents begin to feel the smart of their own fo and yet, by reason of their blindness, can har even then see, that they have been the origi cause of it, for want of keeping their children due subjection; and some have cried out for vice, complaining their son is grown so disobedie they know not what to do. And yet I have kn when Friends have gone under a religious conc to such parents to give them advice, instead taking it well, as they ought to do, they have b so blind and stupid as to return undue reflectio and others again, who have taken it better, wo excuse themselves with the most plausible reas they could invent, saying, the child is wild a playful, and they do not like to correct it, as it l a weak constitution, &c. Now, in those cases is my judgment, that when such private admo tion has been without effect, it becomes the inc pensable duty of the church to interpose, by de ing with them more closely or openly; as the ample of such parents and children, is a hurt our youth, and a dishonour to our holy professi in general, and, as the wise man said, 'Foolishn is bound in the heart of a child, but the rod correction shall drive it far from him;' Prov. xx 15. So, foolish fondness being bound up in t heart of those parents, the rod of church discipli should be used, in order, if possible, to drive away.

"But notwithstanding all the care of godly p rents, it has happened that some will be di bedient; for we find that Samuel, a great a good man, had wicked sons, yet we do not read t he was blamed, no doubt because he did his du The difference lies here,—that, if parents do tru discharge their duty, the children's blood will f on their own heads; but on the contrary, if paren by their indulgence do contribute to it, the ch dren's blood may lie at their doors. * * *

"While writing the above, a mournful conside tion took possession of my mind, relating to t original cause, not only of the great wickedne which so much abounds in Christendom, but al of the too great defection in those of moral and r ligious lives, from the true life and inward pow of Christianity in their hearts; while, at the sa time, they mightily extol the Holy Scriptures wi many extraordinary epithets. Under this prospe it appeared very plain to me, as it has often do before, that this defection in both sorts proce

n the want of truly believing in, and being mediately led and guided by the Holy Spirit grace of God in their hearts, a measure and nifestation' of which (say the Scriptures) is ven to every man to profit withal;' which uld, if obeyed, make wicked men righteous, ral men better, and in the end make both true ristians at heart, and enjoyers of the life and ker of Christianity. It would take up a treatise rite at large upon the virtue and efficacy of s holy and divine principle of the Spirit of God, the salvation of mankind, through our Lord Saviour Jesus Christ, as abundantly testified n the Holy Scriptures, and also in many of our ends' writings. I refer particularly to the ks of our beloved brethren, William Penn and ert Barclay, especially to the latter, in the 4, 5th, and 6th propositions of his Apology, n Immediate Revelation, and the Universality the Light and Grace of Christ, where my reader find it very fully treated of."

THE FRIEND.

FOURTH MONTH 5, 1856.

We have on more than one occasion called at- tion to the continuance of the African slave de, under the protection of the American flag. hough this abominable traffic has been de- nced by all civilized nations, and our own has cted laws for its suppression; declaring it to be hony, and awarding the punishment of death for se convicted of being engaged in it, as princi- s, yet it admits of no doubt, that there are men our community, men too, passing for respectable izens,—who are covertly engaged in the trade, who take advantage of the laws allowing Ame- an consuls in foreign ports to furnish "Sea ers" to American captains professing to embark traffic on the coast of Africa, by which their sels are put under the protection of the flag of country, secured from search by the cruisers Great Britain, and generally enabled to escape h their freight of human beings to the markets l kept open for the sale of human flesh. Once n great while, one of these piratical vessels is tured by the armed cruisers of the United tes, and the miscreant captain and crew sent oe for trial; but when has there been an in- nce of any one of these desperadoes having fered the penalty for piracy.

We do not approve of taking the lives of those aged in this atrocious business, and probably mprisonment for life was substituted for the sent penalty, there might be less difficulty in uring its infliction; and yet, when convictions e taken place, and the guilty party has been tenced to imprisonment, we believe in every tance the culprit has been released by an Exe- ive pardon. In the case of the "Maria E. ith" mentioned in the extract which we give ow, it is probable there will be another oppor- ity for seeing with what alacrity and determi- ion the United States Courts and Government l vindicate the laws and the honour of the na- n. One notice of the seizure of the M. E. ith in Boston harbour, prior to her sailing for rica, in consequence of her design to engage in slave trade being suspected, says that she was *ased;* another says that she ran away from the rshal; but it is surprising that she was allowed escape from the revenue cutter when there s strong ground to believe she was designed for laver; which belief is now confirmed by her cap- e.

What kind of heart must that man have, who can ship a cargo of men and women, five hundred in number, pack them naked into the narrow limits of a schooner, starve and abuse them until nearly two-fifths sicken and die in their loathsome prison, and one fifth of the remainder sink under their accumulated tortures in a few hours after they are landed. Surely, persons who will engage in this murderous trade can lay no just claim to any of the ennobling feelings of men, still less to the character of Christians, and horror must finally overtake them.

While slavery exists among us, and thousands are partaking of its profits, there is a strong disposition to connive at its crimes, to give an indirect support to its cruel disregard of the rights and feelings of its suffering victims, and to care little and do less towards enforcing the laws against the foreign slave trade. Much is said in these free States, as they are called, against slavery and the slave trade, as it is carried on in the South and South-Western States; and yet every year, slavers are fitted out and sail from northern ports, owned or chartered by northern merchants, and sent to Africa to stimulate the ignorant heathen there to murder and robbery, in order to procure human beings who may be sold as "goods and chattels." In a conversation with an intelligent merchant of this city lately, he said there had been, within the last year, several vessels so fitted out and sent from Philadelphia, more from New York, and as many from Boston. Who can correctly estimate the untold misery inflicted on the hundreds of poor men, women and children, torn from their native country, and crowded into those vessels, there to be starved and almost suffocated, amid the filth and corrupted atmosphere of their densely packed holds, and many thrown overboard before death had terminated their agony. What can men look for, who are seeking to make themselves rich by a traffic which inflicts such dreadful misery and death on their fellow beings possessing immortal souls, but that a just God will answer them by terrible things in righteousness for their deeds of cruelty and wickedness.

CAPTURE OF AN AMERICAN SLAVER.

By the Emeu, we have Rio Janeiro dates to 14th Feb.

The American schooner Maria E. Smith had been captured by the Brazilian brig of war Olinda, while attempting to land 320 negroes, which she had brought from the coast of Africa.

The Olinda took the schooner into Bahia, where the commander and crew (all Americans) were ironed and locked up in jail. When the schooner left the coast of Africa, she had on board 500 blacks, but they were so closely packed on board, totally naked, and so badly fed during the voyage, that 180 died and were thrown overboard, and of those landed at Bahia, 64 died a few hours afterwards.

The survivors were immediately fed and clothed, and will be taken care of until their ultimate destination is resolved upon.

The Maria E. Smith, (or Mary Smith,) was formerly a packet, running between Boston and Halifax. She left Boston for the coast of Africa some time last autumn. Attempts were made to detain her on suspicion of her being a slaver, but she ran away from the Revenue Cutter, after she had been seized by the U. S. Marshal.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 15th ult.

The steamship Atlantic, from New York, arrived out on the 12th. George M. Dallas, the American Minister, immediately proceeded to the Adelphi Hotel, where a deputation of the American Chamber of Commerce presented him a congratulatory address. The excitement in England respecting the difficulties with this country, had subsided.

The Peace Conference.—The meetings of this body continued, and it was the general impression, that the terms of peace were nearly adjusted, but nothing of a definite character was known; the injunction of secrecy having been strictly observed. Despatches from Berlin and Vienna state that Prussia had been invited to send representatives to the Conference, and that Baron Manteuffel would leave Berlin on the 14th for Paris, as Plenipotentiary, and Hatzfield, the Prussian Minister, at Paris, would act as second Plenipotentiary.

The War.—The Russian and Allied Generals had met and exchanged proposals for an armistice. The line of neutral ground limited by the Tchernaya, has been traced by the two armies. The Allies were making the ruin of South Sebastopol as complete as possible. On the 28th of Second month, the White Works were blown up. Seventeen Turkish Generals, prisoners to the Russian army, had been sent to Moscow. Advices from Kiel, dated Third mo. 14th, state that a despatch from the British Government had been received, requesting Admiral Watson not to engage in hostilities in the Baltic.

Financial Matters.—A financial crisis had occurred at Constantinople. The Minister of Finance had appealed to the merchants, and invited them to devise a remedy. A serious commercial crisis had also occurred in Norway. Twenty commercial houses had suspended in Bergen.

AUSTRIA.—A further reduction of the Austrian army had been announced. The river Danube had been re-opened, and Lloyd's steamers have recommenced running.

GREAT BRITAIN.—It is stated that Parliament will probably be dissolved early in the Fifth month. Lord Palmerston, in reply to questions propounded in Parliament, said the papers relating to the dispute with the United States respecting Central America, would be presented soon after the Easter recess; but he could not answer as to those relating to the enlistment difficulty, as no answer had been received to the last despatch. Admiral Napier had brought forward, in Parliament, a motion, inquiring into the management of the Baltic fleet, while under his command. He contended that he was sacrificed to cover Sir James Graham's incapacity. After debate the motion was withdrawn. The bullion in the Bank of England had increased £48,000. A dividend of ten per cent. for the year, had been declared on its stock. Consols had advanced to 92¼ and 92⅜.

Liverpool Markets.—Cotton was dull, and prices had slightly declined on some grades; sales of the week, 48,000 bales. There was an improved demand for breadstuffs, and prices were advancing. The quotations were for Western Canal flour, 31*s.* a 33*s.*; Ohio and Southern, from 35*s.* 6*d.* to 37*s.* Wheat had advanced 4*d.* to 6*d.* per 70 lbs.

MEXICO.—At the latest dates, Tamarez remained at Puebla where he is hemmed in by the Government forces. It is reported that he had made preparations to surrender, but that Comonfort had rejected the terms proposed by the besieged. The company, for the purpose of building a railroad from Vera Cruz to the city of Mexico, is progressing in its formation. Affairs at Vera Cruz were quiet.

BRAZIL.—Rio de Janeiro dates to First mo. 23d, have been received. The cholera, which had raged through the whole empire, was dying out in Amazonas, Para and Pernambuco. Its ravages at Piassabussu were terrible; 800 having died out of a population of 1000. In Penedo, containing 14,000, full 2500 perished. In the capital itself, 108 had already died, about 150 were attacked daily, and the deaths averaged 13 per diem.

UNITED STATES.—*Congress.*—In the Senate, the Committee on Post-offices was instructed to inquire into the expediency of discontinuing the franking privilege of members of Congress, and in lieu thereof allowing money payment of postage. The deficiency appropriation bill was variously amended and passed. The Free State Constitution of Kansas was presented by Senator Cass. The Committee on Military Affairs was instructed to inquire into the expediency of establishing one or more national foundries as recommended by the Secretary of War. The subject of the public printing was freely discussed, and the fact appeared to be admitted by Senators, that many hundred thousand dollars were wasted every year in useless printing. In the House, the Committee on the Judiciary was instructed to inquire whether the Kansas Investigating Committee have power to coerce the attendance of witnesses, and punish for contempt. Campbell, of Ohio, requesting to be excused from serving on that committee, Sherman was appointed in his place. A bill authorizing the President to cause the southern boundary line of Kansas to be defined and marked, was referred to the Committee on Territories. Lane, the delegate from Oregon, called the attention of the House to the perilous situation of the white settlers in that territory, in consequence of

the exterminating warfare carried on by the Indians, and demanded an appropriation of $300,000 to secure the services of the friendly Indians, in behalf of the whites. A bill for that purpose was referred to the Committee on Ways and Means. A resolution was passed, giving each new member of the House about $1200, worth of books; the grant amounts in the aggregate to $175,000.

California.—The steamship Illinois, from Aspinwall, with San Francisco dates to Third mo. 6th, arrived at New York on the 27th. The Illinois brought $1,260,000 in gold. The California Legislature had passed resolutions deprecating the election of Banks to the Speakership. A bill had been introduced into the Legislature creating three new States out of California. The steamer Columbia was to leave San Francisco in a few days, with General Wool and a body of troops for the Rogue river. Advices from Oregon state that the Indians were committing fresh depredations at the mouth of Rogue river. Twenty-four persons were killed by them on the 23d of Second mo. The Legislature of Oregon had addressed a memorial to the President, asking for the removal of Gen. Wool. The trial of F. A. Cohen for embezzling the funds of Adams & Co., was in progress, and excited much interest. The missing books of the firm had been recently washed ashore near San Francisco. The price of flour was from $8 to $9 per bbl.; hams, 15 cts., and lard, 19½ cts. per lb. Advices from Costa Rica state that Walker, the conqueror of Nicaragua, had threatened to attack and destroy Punta Arenas. The government had sent troops to defend the place.

Kansas.—Since the opening of the navigation, an active emigration has been going on from the slave States, the emigrants in numerous instances being accompanied by their slaves. A St. Louis paper states that almost every boat that has gone up the Missouri river this spring, has taken up slaves in larger or smaller numbers. The emigration from the free States had also been renewed.

Pennsylvania.—Both branches of the Legislature have passed a stringent License Law, and it has been signed by the Governor. The vote in the Senate was unanimous; in the House, 64 to 32. The Restraining Liquor Law of last session is repealed.

Philadelphia.—Mortality last week, 209. One of the strongest evidences of cold weather during the past winter, was discovered in a water pipe on Girard avenue, near Sixteenth street, a few days ago. The pipe was four inches in diameter, and buried four feet three inches below the grade of the street, in a gravel soil. When dug up, the bore was filled with solid ice. The water has been let into the Pennsylvania Canal, and thus a new impetus has been given to our already very active trade. The Pittsburg Post says that a large number of boats have already arrived and departed at that port with full freights. There is a great amount of produce at Pittsburg, awaiting shipment to the East. The Schuylkill Navigation is also open.

New York.—Mortality last week, 421, viz. adults, 158; children, 263. The exports of specie for the week, were only $158,706.

Miscellaneous.—*Trade at Pittsburg*, since the opening of navigation, has been unexampled in amount. The boats are taking in with all possible speed the immense piles of freight that lay upon the entire length of the levee—all bound for ports down the Ohio.

More Asteroids.—Leverrier states, in a letter to the French Minister of Public Instruction, that he is firmly persuaded that a great number of small planets are situated between Mars and Jupiter, and that before 1860 nearly 160 will certainly be discovered.

Railroad Consolidation.—The Pittsburg Post says the basis of an arrangement has been made by parties representing the several companies forming the line of railroad from Pittsburg to Chicago, via Crestline and Fort Wayne, to consolidate these roads into one company, to run in close connection with the Pennsylvania Railroad from Chicago to Philadelphia.

Prohibitory Liquor Laws.—The Court of Appeals of New York, on the same grounds as the Supreme Court of Massachusetts, has decided that the Prohibitory Liquor Law in its search and seizure clauses, is unconstitutional. It further declares that any prohibitory law which interferes with and affects property already in possession, is unconstitutional and void.

The Thames Tunnel.—According to the report read at the late annual meeting of the Company, the amount of tolls received for 1855, was £4,471 19s. 1d. The receipts are small, compared with the vast cost of the work; but it is said to be gradually progressing in value and in public estimation. It is paved throughout, and well lighted and ventilated.

Capture of a Slaver.—The schooner Maria E. Smith, which was seized in the harbour of Boston last summer, on suspicion of being fitted out for the slave trade, and was finally released, and sailed for Montevideo, has been captured and carried into Bahia, having attempted to land 320 negroes, brought from Africa. She embarked 500 on the coast, *but* 180 *died* during the voyage.

Emancipation.—By the will of the late James H. Terrall, who died at Charlottesville, Va., on the 18th ult., eighty or ninety very valuable negroes are emancipated, and ample provision made for their removal to Liberia, or to some one of the free States.

The Death Penalty.—The bill to re-establish capital punishment in Wisconsin, has been indefinitely postponed by the Legislature of that State.

Saltpetre in Tennessee.—A company has been formed in East Tennessee, for the purpose of manufacturing saltpetre from the nitrous earth found in that section of the State.

Prohibition in Nova Scotia.—The Maine Liquor Law has been passed by the Legislature of the Province. It is to go into effect immediately.

Foreign Coins.—The bill submitted in the United States Senate by Senator Hunter, the object of which is to dispense with the use of the depreciated foreign coins now in circulation, provides that all quarters, eighths, and sixteenths of the Spanish milled or Mexican dollar shall be received at all the offices of the United States at twenty, ten, and five cents, and made legal tenders for all sums not exceeding five dollars; and that these fractions of the dollar of foreign coin when received shall not again be paid out, but be re-coined.

The Shoe Trade.—During the year ending Sixth mo. 1st, 1855, there were made in the State of Massachusetts, 44,308,302 pairs of boots and shoes valued at $37,468,353, and giving employment to upwards of 75,000 persons.

Shipwrecks.—The Cunard steamer Curlew, from Halifax to Bermuda, ran on the North Breaker, off Bermuda, on the morning of the 18th, and sunk in three minutes. The mails were lost, and the steamer was completely wrecked. No lives were lost. On the 30th of First month, the Chilian war steamer Cazador left Talcahuano, having on board 358 persons, 86 of whom were soldiers, 4 officers, 148 women, 10 children, 14 passengers and 68 of a crew. A little before 8 P. M. of the same day, in a smooth sea, and making about nine knots, she ran upon a rock south of Maule, and immediately commenced sinking. An order was at once given to lower the boats, and in the attempt one was unfortunately upset. Only 44 of the 358 were saved, in which number was only one woman.

Reform in Turkey.—The last intelligence from Turkey announces the official promulgation of the long-promised decree, which abolishes all distinctions before the law, as between different races and religions, in the Sultan's dominions. Hereafter Greek, Servian, Moldavian, Bosnian, or Osmanli, if they are domiciled within the borders of Turkey, will stand on the same legal footing, will enjoy the same rights, and will have the same roads to public employment open to them.

RECEIPTS.

Received from Joshua Maule, agt., O., for Nathan Cook, Danl. Atkinson, Benjamin Bundy, $2 each, vol. 29; from Mead Atwater, agt., N. Y., for Hibbart Fuller, $2, vol. 29; from D. P. Griffith, agt., Pa., for Jonathan Sharpless, $2, vol. 28.

WEST-TOWN BOARDING-SCHOOL.

The Winter Session of the School will close on the 11th inst. The children who go to the city, will leave West Chester in the cars on the morning of that day, and arrive at the depot, near the corner of Eighteenth and Market streets, about half past 9 o'clock.

West-Town, Fourth mo. 1st, 1856.

WEST-TOWN SCHOOL.

The Committee charged with the oversight of this Institution, will meet *in Philadelphia*, on Sixth-day, the 11th of next month, at 7 o'clock, P. M.

The Committee on Instruction, and the Committee on Admissions, meet on the same day—the former, at 4 P. M., and the latter, at 5 P. M.

The semi-annual Examination of the Schools will occur on Third, Fourth, and Fifth-days of the same week, in presence of the Visiting Committee.

THOMAS KIMBER, Clerk.

Philad., Third mo. 29th, 1856.

A conveyance will be at West Chester on the arrival of the morning and afternoon cars on Second-day, the 7th inst., for the accommodation of the Visiting Committee.

HAVERFORD SCHOOL ASSOCIATION.

The stated annual meeting of the Haverford Sc Association, will be held at Committee-room, Arch s Meeting-house, on Second-day afternoon, at 4 o'c Fifth mo. 12th, 1856. CHARLES ELLIS, Sec'y

Friends' Boarding-School for Indian Children, Tunessassah.

A man Friend is wanted to aid in carrying out concern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTO 377 S. Second st THOMAS EVANS, Philad., Eleventh mo. 1st, 1855. 180 Arch st

DIED, at her residence in Belmont county, Ohio, CHEL, widow of James Raley, in the 91st year of age; an esteemed member and elder of Concord Pa cular and Short Creek Monthly Meeting. She was of the first settlers in the State, and a member of first meeting of Friends established therein, and w firm believer in the doctrines and testimonies the Friends suffered so much to establish. She was he high esteem among her friends, not only for her up consistent walking through life, but more especially her soundness of judgment in religious matters. was a diligent attender of meetings whilst her ha permitted, and an example of silent reverent wo therein. Continuing green in old age, she manifeste deep concern for Friends in their present trying dis sation, saying there is much home work to do, be grieved at the too prevalent disposition to see the fa of others, and overlooking our own. Many can b witness to her liberality, she being ever ready to what she could to alleviate in sickness, or suffer other ways, saying she would rather do with less home, than not divide with those who needed, as it was certainly the intention of the great Giver. H time was lengthened out beyond her own anticipati yet she kept in view the great uncertainty of life, oft alluding to the subject, and appeared to be waiting t Divine summons. When taken sick a few days bef her death, she observed it was likely to be her last sic ness, but that did not grieve her. She patiently la her allotted portion of suffering, and quietly pass away, the 29th of Second month, 1856, being, we do not, gathered as a shock of corn fully ripe, into t mansions of rest and peace.

——, at the residence of her son-in-law, HANN HOWARD, daughter of the aforesaid R. Raley; a memb of Harrisville Particular and Short Creek Monthly Me ing, in Jefferson county, Ohio. This dear Friend w long be remembered for her unwearied attention to t sick and afflicted. She bore a protracted illness wi much christian patience, saying she had much to t thankful for. She remarked that she could see she a often missed her way, but hoped all would be forgiv her. She passed quietly away on the 9th of First m 1856, in the 66th year of her age, and we doubt n "our loss is her eternal gain."

——, on the morning of the 19th of Third month 1856, at the residence of her son John Butler, in Mahon ing county, Ohio, HANNAH BUTLER, in the 84th year her age; a member of Goshen Particular and Upp Springfield Monthly Meeting. She bore a suffering il ness of a little more than three days, with much com posure and resignation, several times saying, "I fe entirely resigned to the will of my heavenly Father At a time when released from much suffering, she d sired to see her grand-children whom she addresse separately, imparting suitable counsel, desiring them t be good children, and obedient to their parents, an then embracing them, bade them farewell, hoping the might meet in the world of happiness. For severa hours near the solemn close, she appeared frequentl engaged in supplication; but articulation being near prevented by her disease, what she uttered could t gathered only in broken sentences: yet those who wi nessed the solemn close, have, they believe, a well grounded hope, that through redeeming love and merc she has been admitted into the mansions of rest an peace.

——, on the 24th of Third month, 1856, BRULAH daughter of John and Elizabeth Butler, of Mahonin county, Ohio, in the 14th year of her age, after a suf fering illness of near five weeks, which she bore with patience and composure that encouraged her relatives and friends to believe that her end was peace.

——, on the 1st inst., MARY B., wife of Townsend Sharpless, in the 61st year of her age; a member o Philadelphia Monthly Meeting.

The Gum Trade.

um is one of those useful productions of na- which are furnished to man without any exer- of his own, except that of gathering the fruit ally supplied by a bountiful Providence. Its omic use is of great importance to the most zed nations, whilst its commerce affords a ue to the wildest sons of the desert. Gum is getable mucilage, exuding in small quantities the trunks of several trees, as any one may n the common cherry or plum tree. But the of commerce is produced in the wilds of ca and Arabia, the most arid regions of the d. The gum usually termed Arabic, comes a species of *mimosa*, or *acacia Arabica*, and amous in ancient times for its use in medicine n the dyer's art. It is said to be of highly tive qualities, so that caravans which have unexpectedly detained in the desert after all provisions were expended, have been sup- d by feeding upon the gum which formed of their merchandise. But this celebrated le is now surpassed in European commerce e gum *acacia* of Africa, which is not only nced in larger quantities, but is more muci- ous and gummy than the Asiatic species.

the reader examine a map of Africa, he will in the north-western part, a large region de- ted Sahara, or the Great Desert. It is an ense district of arid soil, chiefly consisting of driest sand. A few oases are scattered through barren country, possessed by tribes of Moors, alone inhabit this dreary region. The man- of these swarthy people correspond with their dwelling-place. They are capable of enduring hunger and thirst, as well as exposure to a ing heat, and are generally in the extremes of nence or gluttony, of exercise or indolence. subsist chiefly on the milk and flesh of their e, of which they possess large numbers. They n tents, covered with a strong cloth, woven thread spun by their women from the hair oats. Females of the wealthier class are ght up luxuriously, and are educated in ms of voluptuousness and of absolute submis- to their lords. They are regarded as beings ed for no other use than to minister to the s and pleasures of their husbands, whose s and caprices they must endeavour to humour promote. For instance, the Moor considers ulence to be synonymous with beauty, and a desideratum in the fair sex; and this is ht to be attained by all possible means, even at the risk of losing health and of becoming unable to walk without assistance.

The laborious kinds of employment are performed by slaves, male and female, who are generally procured by predatory incursions into the negro territories, which are undertaken on the slightest pretences of complaint, or without any excuse whatever. These slaves are treated in the harshest manner, being compelled to perform severe labour with a very scanty supply of food and covering. The kings or chiefs seem to have absolute power over the mass of the people, even to the taking away of life, though this is rarely done. In times of peace, the Moors engage in a little agriculture, but their delight is in plundering their weaker neighbours. This is more easily effected by their superiority in horsemanship. Their horses are generally very valuable, of excellent breed and surprising swiftness. They are exceedingly skilful in the management of their steeds, being able to stop them at full gallop, and to fire with accuracy whilst riding at utmost speed.

The Moorish tribes rove about, seeking pasturage for their herds and flocks; and when the scanty herbage of one place is eaten up, they move on to another, receding from the desert as the drought prevails. Their principal wealth consists in their camels, the milk of which is deemed very nutritious, and the flesh highly prized. Besides, these animals can subsist on a little, and are admirably formed by nature to be "ships of the desert." Of all other quadrupeds, only the antelope and ostrich are found in these arid regions; for their amazing speed enables them to reach the watering places, which are few and far between The lion, panther, elephant, and other wild beasts, range the immense forests which skirt the desert, and separate it from the rivers.

The tribes of Moors to whom the gum forests belong are the Fareshez, the Bracknez, and Darmanks. These occupy several oases in that part of the desert which is bounded on the south by the river Senegal, and on the west by the Atlantic ocean. The principal forests of gum trees are those called Sahel, El Fatack, and El Hiebar. The first produces the vereck or white gum, which is held in high estimation; the others yield nebuel, the red gum of commerce. The acacia which grows in the desert is of more stunted form and rugged appearance than that which flourishes by the river-side; for the banks of the Senegal are partially covered with a stratum of vegetable earth, where foliage abounds, but the gum trees of these places are not numerous. In the desert, the acacia seldom exceeds twenty feet in height and three feet in circumference; and it has that rugged and crooked form which is common to the herbage of this arid region, where the great drought and parching winds give a blighted and stunted appearance to all vegetable productions. The branches of the gum tree are thorny at the projections of the leaves, which are of a dirty green hue. The blossoms are short, and of a white colour.

In western Africa there are only two seasons in the year, the dry and the rainy. The duration of the rains slightly varies according to the latitude, being of longest continuance near to the equator. In Senegambia they last about two months, which are preceded and followed by a month of storms called tornadoes. During eight months of the year, the sun shines brilliantly in a cloudless atmosphere. October may be termed the drying month, a period fruitful in productions of the soil, and prolific of fevers and other dangerous diseases, since the atmosphere is then filled with miasmata from decomposed vegetable matter. At this time, the gum trees swell with moisture, and prepare for their harvest season. In November, the bark, which had been smooth and of a dark green colour, begins to crack in numberless places, and give out the gum. No help of man is required to make incisions in the stem, for nature performs the whole work. The hot wind of the desert begins to blow, drying up everything with such severity, that no vegetable matter can resist its influence. The tall grass of the plains now withers and becomes like straw; trees on the high grounds put on a wintry appearance, and would soon burn like fire-wood; and household furniture warps and cracks, so that drawers will not shut nor boxes lock. Even hard and well-seasoned wood cannot wholly resist the scorching influences of the *harmattan*. These effects are increased by clouds of fine sand, which are carried in the hot blasts and terrific whirlwinds which sweep over the country.

The gum issues from the cracks of the tree in different forms, but principally in drops, about the size of a partridge's egg. The juice adheres, as is well known, to the bark, where it quickly dries and is soon ready to be gathered. Though the gum has a dull appearance on the outside, it presents a beautiful clear and brilliant surface wherever it is broken, and if put into the mouth for a few moments becomes transparent as crystal. About a month is allowed for natural causes to accomplish the exuding process, when the trees are supposed to have completed their yield for the year. The Moors now prepare for the harvest. They quit their camps in the desert, leaving only the aged, infirm, and little children, with a few persons to take charge of the cattle which remain behind. A tumultuous assembly of horse and foot, men and cattle, women, and children, proceed in a promiscuous crowd to the forest belonging to the tribe. Here they form an encampment, in which they remain about six weeks whilst gathering the gum. Old and young engage in the work, stimulated by the chiefs and princes who overlook their labour. The gum is piled up in heaps until the whole is collected, when it is loaded on cattle brought for this purpose. The beasts of burden are the camel and ox; the former carrying four or five hundredweight, the latter about one and a half. The gum is stowed in large leathern sacks made of tanned ox hides, two of which are fastened together and slung over the backs of the cattle so as to balance.

The work proceeds slowly, as there is no fear of rain to interrupt it, and Africans seldom hurry in the performance of their tasks. Their field operations occupy but a short period of the year, and time is of little value in their eyes. At length, the harvest is completed, and the day for moving arrives. When the signal for departure has been given, the tents are struck, the cattle are laden

with baggage and merchandise, and the whole multitude set off in the same tumultuous manner as that in which they arrived. The princes and rich men are mounted on beautiful horses, or fleet dromedaries, gaily caparisoned. Their wives are seated on the best camels in a kind of basket covered with an awning, decked out with gorgeous colours. Cattle and goats necessary for provision by the way, are mixed up with the beasts of burden and crowds of foot-passengers, filling the air with a variety of discordant sounds. A choice band of armed men act as cavalry and mounted police, to defend the caravan, and preserve some kind of order amongst them.

In this manner the caravan proceeds to the annual gum fair, held on the banks of the Senegal, a considerable distance above Fort Louis, which is the principal settlement of the French on this river. This people commenced trading operations with Western Africa about the beginning of last century, and established themselves in the Senegal. Saint Louis is a small island, about four leagues above the bar at the mouth of the river. This bar or ridge of sand is a formidable obstruction to navigation, as it only allows small vessels to pass with safety. Once across this dangerous reef, such craft can easily sail to Podor, about 180 miles up the stream, and in the rainy season to Galam, which is five or six hundred miles higher. The French have small establishments at both of these places, and all the trade of the river, in so far as Europeans are concerned, is in their hands. The English pursue their commerce with this part of Western Africa through the Gambia, which is a better river for navigation; and their trade in gum is carried on at Portendie, a small settlement on the coast, a little above the Senegal; but this lucrative branch of commerce is chiefly in the hands of the French.

The lower part of the Senegal is bordered with immense forests, filled with wild beasts, monkeys, and parrots of various species. Higher up, the desert land reaches to the northern bank of the river, and here the great gum fair is held, at a place about half way up to Podor. It is one of the most desolate spots in the world, being a vast plain of moving sands, glistening with whiteness. This solitude extends as far as the eye can reach, unrelieved by any tree or plant. It is an ocean of sparkling sand. Here the French merchants await the arrival of the Moorish tribes. The din of their approach can be heard at a great distance over the dreary solitude. The noise grows louder and louder, till an immense cloud of dust betokens their arrival. And soon the barren plain is covered with men and beasts in teeming crowds, which it requires a long time to settle in anything like an orderly manner.

At length, when all things are ready, a cannon is fired as the signal for commencing business, and Franks and Moors try every artifice to make a good bargain. The Moorish princes fabricate all kinds of excuses for raising the price of the gum, and invent a hundred reasons for delaying the negotiations. Their procrastination and apparent apathy madden their more lively customers, who are sometimes obliged to yield under a threat of the gum being carried to Portendie and sold to the English. The French, in their turn, try to overreach the Moors, which they often do by enlarging the size of the *kantar* or measure by which the gum is sold. The Africans do not understand the principles of mensuration; and their customers have gradually increased the *kantar* from 500 to 2000 pounds.

The price of the gum is paid in pieces of Indian cotton cloth, or blue baft, which meets with a ready sale to the tribes of the interior. The merchants have tried to substitute articles of French manufacture for this eastern cloth; but the Moors cannot be tricked in this respect, as they instantly detect a spurious from a genuine article by the smell. The mode of barter is always disadvantageous to the Africans, who may understand the value of their own merchandise, and the price which it will fetch in an European market, but do not know the cost price of the goods which they receive in exchange. For instance, when they barter gold for iron, they may insist upon having the mint price for the precious metal; but they are duped by the European, who estimates his iron at four times its value, and thus obtains the gold at a fourth of its real worth. In this way, gum has been purchased in Africa as low as twopence the pound, whilst it has sold in Europe for fifteen or eightcenpence. In 1833, it was worth 75s. to 78s. per cwt. in England, or more than eightpence per lb. after payment of duty at 6s. per cwt. In 1843, garbled gum sold at from 87s. 6d. to 95s. per cwt., or about tenpence per lb. The English imports for three years ending 1842 amounted on an average to 17,715 cwts., or nearly two millions of pounds annually; whilst at the close of last century the whole quantity exported from Africa was about 600,000 lbs. annually. During the last wars, all the French settlements in Africa were taken by the English, who restored them at the making of peace, thus giving up a considerable privilege in the gum trade.

For "The Friend."

It was quite refreshing in reading the journal of that Ambassador for Christ, William Savery, to observe the love and gospel fellowship richly pervading the hearts of Friends in his day, when one hundred and forty of them met at New Castle on the occasion of his embarkation for England, with Samuel Emlen, Deborah Darby, Rebecca Young and two others. We can hardly suppose that jealousies and distrust of one another, then set at variance members who held the same religious principles, and advocated the same faith. Their views of the unity and sincere regard for each other which characterize the friends of Christ, could not have led them to dream of divisions in their beloved Society, designed by the Head of the church to be an example and model of the fruits of the Spirit of their Holy Redeemer. After holding a public meeting for the inhabitants in the Court House at New Castle, which was attended by one of the judges with several magistrates, lawyers, and towns people, in which the gospel of salvation was preached, they returned to the inn and after dining, the large room and balcony were furnished with seats. W. Savery says, "Friends who accompanied the voyagers hither then sat down, in number about one hundred and forty, and some of the towns people hearing of it, also came in. The great Lord of the family was evidently with us, and favoured us with a precious solemnity; under which our endeared Friends, D. Darby and R. Young, through the tendering influence of gospel love, were again qualified to water the plants of our Heavenly Father's planting, and affectionately to bid them farewell in the Lord. Two of the Friends who were going abroad in Truth's service, were also exercised in the expression of heart-felt concern for the preservation of themselves in the love and life of Truth, and also of their *long endeared brethren and sisters* whom they were about to leave. *Holy fellowship and gospel love* being refreshingly and encouragingly felt among us, we were once more *united in lifting up our hearts in prayer and praises;* committing *each other to the merciful* and all-wise disposal of the everlasting Shepherd. This prepared the way for many near and tender Friends and connections to pa the mutual experience of that love which is out dissimulation, and in which the world's ries are not privileged to rejoice. *May it continue and increase throughout all the chu of Christ."*

This was the heart-breathing prayer of tha voted minister of the Lord Jesus, whose life spirit were dedicated to promote the spread kingdom, in the world and in his own reli Society. He was one of the most conspic advocates for the doctrines of our Society, in reference to the divinity and the sufferin Him who declared, "By this shall all men k that ye are my disciples if ye have lo another," and also to the manifestation o Spirit in the heart, by which this love is abroad in it. To advocate sound principles a ingly, the love of Christ must abound in enabling us to bring forth the fruits of the go "There is no fear in love, but perfect casteth out fear, because fear hath torment. that feareth is not made perfect in love." "He loveth not his brother whom he hath seen, can he love God whom he hath not seen? this commandment have we from him, tha who loveth God, love his brother also." If love prevail in us it will lead us to seek the toration of those who have erred, and the incr of true gospel fellowship among brethren.

From Chambers's Journa

Pipes.

We are going to say a few words concer pipes, which have latterly thrust themselves ward for observation in a rather unusual sty this great city of London, and set our thou flowing all about and through them. The res we hope, will soon see that the subject is o no trifling importance, and that it has some in esting aspects.

We might begin our disquisition by remin him that he is himself nothing but a walking talking tubular machine; that from the hai his head to the pores of his toes, from his g aorta to his minutest capillaries, not forgetting alimentary canal with its subservient appara he is but a conglomerated system of pipe-wo We might show also, that in this he but resem the vegetable kingdom, which is nothing but stupendous concatenation and involution of tub structures. But we scorn to be prosy and giaristic under the pretence of being scientific, shall therefore leave all that for him to rumm up at his leisure, should he need the informat and feel the inclination to acquire it. The p we are going to look at shall be the pipes of m own manufacture, with which he has sough minister to his own necessities, convenience, pleasure, or to effect for the body social, as fa might be, what the wondrous organisms of na accomplish for the individual objects of her c

We may feel pretty sure that the first pipe t for an artificial purpose was not artificially constr ed. Whether it was the bone of an animal, or shaft of a bamboo, or a reed cut from the swam whether it was a rude musical-instrument, or ser some simple hydraulic purpose, it would serve useful end to inquire. That man took to blow wind-instruments, and dancing to their music, fore he learned to lead water through a pipe, see judging from the habits of savage tribes in our day, likely enough; but we will pass the sav era, and look in upon our progenitors, when ci ization and social usages had stimulated cont ance, and given birth to new necessities.

The applicability of pipes to the purpose of c veying water from some distant natural reser

he dwellings of man, must have been a very
y discovery; and if we do not find pipes of very
t antiquity among the remains of ancient cities,
ay be owing to the fact, that they were first
le of very perishable materials, and are no
er in existence. We know that the first pipes
l extensively for that purpose by our own
r-companies, were formed from the boughs
trunks of trees, hollowed out by means of au-
of different sizes, and fitting into one another
the joints of a flute. A source of childish in-
st, to us some forty odd years ago, was to wit-
the boring of these trees, which were mostly
, and to carry off the chips for a bonfire to ce-
ate one of the Duke's victories. When, as
often the case, the boles were not straight,
had to be bored at each end; and if the en-
perforation could not be completed that way,
impy kind of auger was rammed in as far as
ould go, and, being wedged into the required
tion to turn the corner, was worked round,
r the manner of a screw with a screw-driver,
l the passage was effected. These pipes were
riably laid down with the bark upon them,
h helped to preserve them from decay; they
e, from motives of safety, laid beneath the
-pavements, to escape pressure in the wagon-
; and, under favourable circumstances, they
ld last as long as the generation that laid them
n. They were frequently out of repair, however,
testified that condition by an impromptu foun-
in the footpath; but they were repaired in a few
utes by a handy fellow, who displaced a flag
h his pickaxe, turned up the earth with his
le, and medicated the wound in a moment by
ing in a peg with a hammer. These wooden
s answered their end very well, while they
d, in all those places where water was supplied
the works on the continuous system; but
re the intermittent plan was followed, as in
don, they were the source of endless nuisances
abominations. When the water was turned
and the air admitted, the damp wood grew
ldy, and rotted, and the next rush of water
ied the mildew and the rotten fibre into the
and cisterns of the inhabitants. Of this we
woful personal experience some years ago, on
Surrey side of the Thames. How many miles
he old wooden pipes yet continue to do duty
erground in the neighbourhood of London and
where, we will not undertake to say; but not
r long ago, in the neighbourhood of Deptford,
came upon the aforesaid handy Jack, armed
h his spade and pickaxe, hammer and pegs,
saw him disinter a leaky patient, apply the
nt styptic, and cover him up again, quite com-
ably—all in three minutes.

Pipes of earthenware are among the most fre-
nt memorials of ancient cities; and there is no
bt that they were in extensive use for the pur-
s of water conveyance among the Romans. It
been assumed, that because the conquerors of
world erected vast aqueducts, they not only
sed the hydrostatic paradox, but were ignorant
the principles of hydraulics altogether. We
't know what to say to that. It is true that
ne was supplied with water by nine aqueducts;
the water was led from them to the dwellings
the citizens by earthenware pipes, which, ac-
ling to Veginus, delivered not less than 26,-
,000 of gallons daily; and it is not easy to see
, with such a delivery to manage, and the ex-
ience they must necessarily derive from it, such
ople could have escaped a knowledge of the
s of fluids. In making use of earthenware
es, the ancients probably were impelled as much
economy as any other consideration; but they
ld not have selected a better medium for the
conveyance of water; and it is on all accounts to be regretted that we have not followed their example. The pipes of iron and lead, through which our water-supply reaches us, have been the source of infinite annoyances and bodily diseases, which we should have escaped by the use of earthenware. Our water-companies have, one and all, ignored them, on the ground of their presumed frailty and fragility; and yet we find them largely in use throughout France and Switzerland for the underground conveyance of water—one firm of manufacturers having supplied no less than 20,000 miles of earthenware piping to various corporations within the last fifteen years for this identical purpose. Our engineers contend that the 'hydraulic shock,' as they term the sudden rush of water into empty pipes, would shiver them to atoms; and so undoubtedly it would, as it does sometimes the strongest iron pipes, were the attempt made to use them under the system of intermittent supply; but the public health demands everywhere a constant supply, under which there need be no recurrence of the destructive hydraulic shock. We can certainly do in this respect what has long been done by our neighbours.

But though we use no earthenware pipes for the service to which they could be most advantageously applied, we yet manufacture them for other purposes, in quantities of which the unobservant public has not the remotest idea. Improvements in agriculture have brought them into demand for the drainage of land; and, buried beneath the grassy meadows and broad arable slopes of Britain, they lie in interminable reticulations, whose extent must be measured by tens of thousands of miles. Again, for thousands more, they lie along the margins of the iron road, to drain the rain-fall from the sleepers and keep the ballast dry. And again, sunk far underground in our populous cities, they pour the sewage of the dwelling into the main drain, or substitute the old brick culvert or the open ditch, sealing up the infectious effluvia that else would poison the air we breathe. They are of all sizes, from two inches in diameter, or less, to twenty, or more; they are manufactured by the simplest or the most elaborate means, from the mere turning of a handle and drying in the sun, to the careful casting in moulds and baking in the kiln; they are soft and porous, or hard and solid as a rock; they are impervious to air or water, or they are drilled in myriads of small holes for the percolation of the draining fluid. Fresh uses are discovered for them almost every day; and where their availability will end, no man at the present moment need attempt to divine.

In this iron age, it is the iron pipe that asserts its sovereignty over all the rest, and claims the most of our attention. Millions of capital, in the shape of iron pipes, lie buried not a yard below the feet of the pedestrian as he walks the streets of London. The water and the gas companies invariably pipe with iron, though both might use earthenware if they chose. There are between fifty and sixty miles of streets in London, exclusive of the new suburbs; and throughout their whole length lie, side by side, beneath the pavements, the huge iron mains of the gas and water companies. These mains are often doubled, trebled, and quadrupled, to meet the requirements of the district; and it is likely that the fifty miles of streets, added to the additional extent of suburb, contain not less than 300 miles of main pipes, averaging some ten inches in diameter. Add to these the monster pipes, a yard in diameter, many leagues of which are in the course of laying down, east, west, north, and south, of the metropolis, while we write, and some notion may be formed of the mass of iron buried for our convenience beneath the soil of this vast city. In a hundred other cities and towns in the realm, there is the same or a corresponding prodigality in the use of iron pipes; which, with our national predisposition for whatever is durable and substantial, we are continually pressing into service. The manufacture of these indispensable articles may be regarded as a modern species of industry; at any rate, it has grown up, within the memory of persons now living, from a comparatively insignificant trade to one of great extent and importance. The work employs a considerable number of hands; and, as the process of casting a large pipe is no trifling pastime, but a work of considerable responsibility, a class of men have to be employed upon whom reliance can be placed. Iron pipes were originally cast horizontally in moulds of sand, the preparation of which was a work of much time and care. They are now cast upright, in moulds sunk in the ground; and the labour attendant on the process is in some measure reduced.

(To be concluded next week.)

Epistle of George Fox.

Dear Friends and Brethren, to whom is my love in that which never changeth, but remains in glory, which is over all, the top and corner-stone. In this all have peace and life, as ye dwell in the blessed Seed, wherein all is blessed over that which brought the curse; where all shortness and narrowness of spirit, brittleness and peevishness are. Therefore keep the holy order of the gospel. Keep in this blessed Seed, where all may be preserved in temperance, patience, love, meekness, righteousness, holiness, and peace, in which the Lord may be seen amongst you, and no ways dishonoured, but glorified by you all. In all your meetings, in cities, towns, and countries, let righteousness flow among you, and the holy truth be uppermost, the pure Spirit your guide and leader, and the holy wisdom from above your orderer, which is gentle, and easy to be entreated. Keep in the religion that preserves from the spots of the world, which is pure and undefiled in God's sight. Keep in the pure and holy worship, in which the pure and holy God is worshipped, to wit, in the Spirit and in the truth, which the devil is out of, who is the author of all unholiness, and of that which dishonours God. Be tender of God's glory, of his honour, and of his blessed and holy name in which ye are gathered. All who profess the truth, see that ye walk in it, in righteousness, godliness and holiness; for "holiness becomes the house of God, the household of faith." And that which becomes God's house, God loves; for he loves righteousness,—the ornament which becomes his house and all his family. Therefore, see that righteousness run down in all your assemblies, that it flow, to drive away all unrighteousness. This preserves your peace with God; for in righteousness, ye have all peace with the righteous God of peace, and one with another.

Every one that bears the name of the Anointed, that high title of being a christian, named after the heavenly Man, see that ye be in the divine nature, made conformable unto his image, even the image of the heavenly Divine Man, who was before that image which Adam and Eve got from Satan in the fall, so that in none of you that fallen image may appear, but his image, and you made conformable unto him. Here translation is showed forth in life and conversation, not in words only; yea, and conversion and repentance which is a change of the nature of the mind, and of the heart, of the spirit and affections, which have been below, and come to be set above; and so receive the things that are from above, and have your conversation in heaven, not that conversation which is

according to the power of the prince of the air, that now rules in the disobedient. So be faithful; this is the word of the Lord God unto you all. See that godliness and holiness, righteousness and truth, virtue, and the fruits of the good Spirit, flow over the bad and its fruits, that ye may answer that which is of God in all; for your heavenly Father is glorified in that you bring forth much fruit. Therefore ye, who are plants of his planting, and his trees of righteousness, see that every tree be full of fruit. Keep in true humility, and in the true love of God, which doth edify his body; that the true nourishment from the head, the refreshings, and springs, and rivers of water, and bread of life, may be plenteously known and felt, amongst you; that so praises may ascend unto God. Be faithful to the Lord God, and just and true in all your dealings and doings with men. Be not negligent in your men's meetings to admonish, to exhort, and reprove in the spirit of love and meekness; to seek that which is lost, and to bring back again that which hath been driven away. So let all minds and spirits, souls and hearts, be bended down under the yoke of Christ Jesus, the power of God.

Much I could write, but am weak, and have been mostly since I left you. Burthens and travails I have been under, and gone through many ways, but it is well. The Lord Almighty knows my work, which he hath sent me forth to do by his everlasting arm and power, which is from everlasting to everlasting. Blessed be his holy name, which I am in, and in which my love is to you all.

G. F.

Barbadoes, 1671.

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 236.)

THOMAS AND ELIZABETH GRIFFITH.

Thomas Griffith was married to Elizabeth Knowles in Philadelphia, about the Twelfth mo., 1699. They were active members of the church, who, having submitted to bear the cross themselves, were concerned that others should walk under its holy restraints. They were both appointed to the responsible station of elder, which they filled to the satisfaction of their friends, and the reputation the Truth.

Elizabeth deceased on the 23d of the Twelfth month, 1726, and her friends say, she "was concerned for the promoting of piety and virtue, a kind assistant to the poor and distressed, and in good unity with Friends in general."

Thomas lingered about two weeks after his beloved wife, dying the 5th of the First month, 1727. His friends say, he "was a zealous and useful member of Society, concerned for the maintenance of good order in the church, and of good report."

Of these two valuable Friends, Thomas Chalkley says, "Thomas was a serviceable man, and well esteemed in our Society; and his wife, a noted woman for being helpful to, and visiting the sick; she chose the house of mourning, rather than the house of mirth. They were worthy ancients, who made peaceful and good ends, and to whom may be properly applied that remarkable text of Scripture, "Mark the perfect man, and behold the upright, for the end of that man is peace."

JOHN SCARBOROUGH.

John Scarborough, the son of John Scarborough, coach-maker, of London, was born in that city in or about the year 1667. In the year 1682, his father came to America, and purchased a tract of land in Middletown, Bucks county. He brought his son John with him, and after remaining in the country two or three years, returned to London for his wife and family. He had suffered persecution in England, and looked to his plantation in America, as a place of refuge, where he might enjoy freedom and liberty of conscience.

His wife, however, was not willing to come to the new world, and he after a time gave his possessions in Pennsylvania to his son John, charging him therein to fear God, and mind the Truth he had been convinced of. He told him also that he did believe his being in America, was the Lord's doing, and that He would bless him and make him serviceable if he continued faithful. He concluded by charging him, that when it was well with him, to be sure and be kind to the poor Indians, who had been very kind to them in their need, supplying them with provisions, when as yet their land produced none.

His son John remained with a friend, in whose care his father had left him for a time, until he was able to take charge of his own farm. Here he lived, and being faithful to the manifestations of Truth, he grew in religious experience. Towards the close of the century, he felt as he conceived a concern to leave his farm now brought into cultivation, and remove into the wilderness, as the land lying in what is now Buckingham and Solebury townships of Bucks county, was then deemed. He went by himself to view the country, and received as he thought a divine intimation, that it would be right for him to settle there, with a promise, that a religious people would be raised up and gathered there. In faith, he took up land, and in the year 1700 removed thither with his family. His openings respecting the place proved true. Several families of Friends soon followed him, and religious meetings were quickly established, held alternately at their houses. The following year, a gift in the ministry of the gospel was committed to him, and his labours were acceptable to his friends, and their meetings from settlers and otherwise speedily increased. A meeting-house was built at Buckingham, which he lived to see attended by a large congregation.

In his prosperous condition, he did not forget his father's charge to be kind to the Indians, and he was wont to say that he found them a sensible people. They acknowledged an Almighty Supreme Being, whom they called a good Manito or Spirit. They believed that if they did well in this life, he would reward them, and they should live with him after death. They also believed in an evil manito, to whom, if they did evil, they must go when they died.

In unity with his friends, useful in the church, and in the world, John Scarborough filled up his days. Towards the close of his life, he had a divine intimation as he believed, that his end was nigh. He thought it right, whilst in health, to speak of it to his friends, and having his worldly affairs settled, being at peace with God, his last sickness was neither unexpected nor unwelcome. He manifested resignation to the Lord's will, and signified that his peace was made. He gave suitable advice to his mourning family, and expressed his desire that the walls of Zion might be repaired, and her borders enlarged. After these "expressions, he passed away as in a sweet sleep, on the 27th day of the First month, 1727, in the 60th year of his age."

THOMAS BRADSHAW.

Thomas Bradshaw removed from Nottinghamshire, Old England, to Pennsylvania, in 1682, and settled at Darby. He was one who had b convinced of the Truth, and who walked in it. was one of the first elders of Darby meeting, was, his friends say, "a man in good esteem, particularly serviceable in the church." He d Second mo. 5th, 1727.

JAMES LORD.

James Lord was born in West Jersey, n Woodbury, in the year 1693, of believing paren He in early life submitted to the visitations Divine grace, and became first a babe, then young man, then a strong man in Christ, and ing faithful to the pointings of duty, he was great service in the militant church. His frien say, "He received a lively gift of the gospel n nistry whilst young in years, was frequently ex cised therein to the edification and encouragem of Friends; and was much concerned for the tr Sioners, that they might hold on their way, a that the outcasts of Israel might be gathered hoc into the true fold of rest. An exemplary man, which he greatly adorned the doctrine he preached

Of his travels in the work of the ministry, have little information. He visited some of t Yearly Meetings for worship, and in company wi Thomas Chalkley, some meetings in Jersey. Th mas writes, "In the beginning of the winter 1726–7, James Lord and I, in the love of Chris visited the meetings at Alloway's Creek, Cohanse Pensgrove, Woodbury, Newton, and Haddonfiel having meetings every day in the week except t last, and sometimes riding nearly twenty mil after meeting, the days being at the shortest, an the weather very cold; but the Lord was with which made amends for all the bodily hardshi we met with."

In the midst of his career of usefulness, Jam Lord was taken ill, and deceased the 24th or 25t of Seventh month, 1727. Thomas Chalkley th notices his death:—"On Second-day, the 25th the Seventh month, 1727, I had the sorrowf tidings of the death of my beloved friend, Jam Lord; who, on his death-bed, desired that I migh be sent for to his burial. In the consideration t that christian love which was between us, I thin I may truly note, that we were always glad to mee each other; therefore the thoughts of this so sud den change and final parting, brought, for th present, a sadness and heaviness over my mind considering his station in that neighbourhood, an service in that congregation to which he did be long; for therein he was well-beloved and ver serviceable.

"And oh! the loss that his dear wife and ten der children will have of him, really affects m with sorrow in penning these notes; but the sor row, in these things, is all on our side; for he without doubt, is at rest with his great Master i heaven. We had a larger meeting at his funera than ever was known to be there before, an ancien Friend told me, which was solemn and serviceable to many."

(To be continued.)

Edible Fishes of New York.—The New York State Agricultural Society have offered a premium of one hundred dollars (gold medal or money,) for an approved work of 100 pages, duodecimo, long primer, for the transactions of the society, on the Edible Fishes of the State which are susceptible of domestication and cultivation.

Chrysostom lays this down for necessary doctrine. "To sacrifice the whole soul and body to the Lord, is the highest service we can pay unto him. God promiseth mercy unto penitent sinners; but he doth not promise them that they shall have so much time as to-morrow for their repentance."

Selected.

WEARING WHITE.

While walking out one pleasant day,
Beside a thoughtful child,
She turned to me her earnest face,
And asked in accents mild,
There are some people dressed in black,
I very often meet;
Why do they wear that gloomy dress,
When walking in the street?"

We very often talk of death,
That little child and I;
She thought it was a happy thing,
For children, young to die.
She did not know they went to rest,
Beneath the cold, dark sod,
But pictured them on Jesus' breast,
Forever safe with God.

How could I say, "For ransomed ones,
We wear this gloomy dress,"
And not disturb her tranquil thoughts
Of heavenly happiness?
I could not bear to see the look
Of sorrow and surprise,
That such a mournful glimpse of death,
Would summon to her eyes.

And so I said, "That solemn dress
Is useful as a token,
That unto one who weareth it,
The mighty Lord has spoken."
She looked confused, then softly said,
"But *black* why should it be?
The saints wear white, and so would I,
If God should speak to me."

Again I said, "Our absent friends,
We miss, when out of sight;
And when they die, we never feel
Like wearing colours bright."
She shook her head, "Why should we mourn
For those who are so blessed?"
And I no words could find to tell
Why they in black were dressed. C.

N. Y. Observer.

From "The United States Magazine of Science, Art, &c."

Transportation of Passengers and Wares.

We find in the United States Magazine of nce, Art, &c., for Fifth mo., 1855 a long and resting article on the transportation of pas-gers and wares; in which there is an elaborate cription of the mode of action and mechanical struction of locomotives, together with a very account of the Norris Locomotive Works in iladelphia, all illustrated by well executed wood . From the introductory, we make the follow-extracts.—Ed.]

Before the days of Semiramis, whose highways among the first mentioned in history, or the s when Roman way-wrights constructed tho-ghfares, as durable as their language, or Onund, Norway, earned his title of road-maker, or adam proved the virtue of broken granite, kind could not have failed to perceive that in portion to the smoothness and levelness of the ad over which they journeyed, so was the d, ease and comfort of travelling. "Make the s straight," must have been a precept of pe-ar significance in an age when paths were the routes; we can easily imagine, that the maker road would be regarded with not less of reve-gratitude than he who "digged a well." Such ght as we get into remote antiquity, shows us the earliest nations in the "far east," and in countries bordering the Mediterranean, had tered the rudiments of road-making, and shaped n into a completeness not far removed from nce. The Romans, borrowing the idea of paved s from the Carthagenians, set to work with that tical common sense which characterized them, constructed roads from their capital city to y quarter of their mighty empire. With them, ief point was to have the roads straight and level; they understood too well the importance and advantage of facile means of transit and communication, and, with singular skill and boldness, they pierced or excavated hills, built bridges and viaducts, and raised embankments, remarkable alike for their extent and their durability.

In Italy alone there were several thousand miles of public highways; of these the "Queen of Roads," or "Appian Way," 142 miles in length, is the most noteworthy. It was constructed by Appius Claudius, 310 years before the birth of Christ; and Procopius writing in the sixth century, says of it:—"To traverse the Appian Way is a distance of five day's journey for a good walker, and it leads from Rome to Capua; its breadth is such that two chariots may meet upon it and pass each other without interruption; and its magnificence surpasses that of all other roads. For constructing this great work, Appius caused the materials to be brought from a great distance so as to have all the stones hard and of the nature of millstones, such as are not to be found in this part of the country. Having ordered this material to be smoothed and polished, the stones were cut in corresponding angles so as to fit together in joining without the intervention of copper or any other material to bind them, and in this manner they were so firmly united that in looking at them one would say they had not been put together by art, but had grown so upon the spot; and notwithstanding the wear of so many ages—being traversed daily by a multitude of vehicles and all sorts of cattle—they still remain unmoved; nor can the least trace of ruin or waste be observed upon these stones, neither do they appear to have lost any of their beautiful polish; and such is the Appian Way." Most of this description remains true even to the present day; and the road, after a lapse of more than two thousand years, still presents an instructive model to the modern artificer.

The modes of travelling and conveyance generally, were of a comparatively rude and primitive kin din Great Britain, till the latter part of the seventeenth century; and anything like comfortable and quick travelling cannot be said to have been known till a century later, when mail-coaching was introduced. In old times, people in the humble walks of life journeyed only on foot, and those of the higher stations on horseback. Noblemen and gentlemen, as much for ostentation as use, kept running footmen—a class of servants active in limb, who ran before them on a journey, or went upon errands of special import. The pedestrian powers of these footmen were often surprising. For instance, in the Duke of Lauderdale's house, at Thirlstane, near Lauder, on the table-cloth being one morning laid for a large dinner party, it was discovered that there was a deficiency of silver spoons. Instantly the footman was sent off to the Duke's other seat of Lethington, near Haddington, fully seventeen miles off, and across hills and moors, for a supply of the necessary article; he returned with the bundle of spoons, in time for dinner. Many like instances of their great agility and wonderful powers of endurance could be cited, as could cases among other nations, not only in ancient but modern times. The Incas of Peru, as well as the Montezumas of Mexico, had their relays of runners extending throughout their respective empires; in the latter, delicacies for the royal table were conveyed by them from the coast to the great central city, in a single night; even among the aborigines of our own territory, there were individuals of like capacity.

In England, when the matter of communication was of particular importance, or required to be despatched to a considerable distance, horsemen were employed; and these, by means of relays of fresh animals, and great toil of body, would proceed journeys of some hundreds of miles to accomplish what would now be much better done, in three minutes of time, by the electric telegraph. Some journeys performed on horse back in former days would be considered wonderful, even in modern times, with good roads. Queen Elizabeth died at one o'clock on the morning of Thursday, the 24th of March, 1603. Between nine and ten, Sir Robert Carey left London (after having been up all night) for the purpose of conveying the intelligence to her successor, James, at Edinburgh. That night he rode to Doncaster, a hundred and fifty-five miles; next night, he reached Witherington, near Morpeth; early on Saturday morning, he proceeded by Norham, across the border; and that evening, at no late hour, kneeled beside the king's bed, at Holyrood, and saluted him as King of England, France, and Ireland. He had thus traveled four hundred miles in three days, resting during the two intermediate nights. But it must not be supposed that speed like this was attained on all occasions. At the commencement of the religious troubles in the reign of Charles I., when matters of the utmost importance were debated between the king and his northern subjects, it uniformly appears that a communication from Edinburgh to London, however pressing might be the occasion, was not answered in less than a fortnight. The crowds of nobles, clergymen, gentlemen and burghers, who at that time assembled in Edinburgh, to concert measures for opposing the designs of the court, always dispersed back to their homes after despatching a message to King Charles, and assembled again a fortnight thereafter, in order to receive the reply, and take such measures as it might call for. And even till the last century was pretty far advanced, the ordinary riding post between London and Edinburgh regularly took a week to the journey.

In consequence of the inattention of the masses to roads, and the wretched state in which they were kept, the progress of the adaptation of wheeled vehicles was slow. According to Stow, wagons for the conveyance of goods and passengers were in limited use as early as 1541; but the most of the traffic was carried on by means of pack horses, which tethered together in long trains, made their way slowly and painfully along the causeway, and whoever met them was obliged to step off into the mire on either side, to get out of their way. "The people of Kendal," says Roger North, writing in 1676, "could write to most trading towns and have answers by the packs—for all is horse-carriage—with returns—time being allowed—as certain as by the post." In 1609, to send a letter from London to Oxford, and get back an answer, took a whole month, and even after the establishment of the post, in 1650, correspondence was but little expedited. The introduction of coaches (probably from Hungary,) asserted a writer of the day, would ruin the country; wagons mentioned by Stow, were advocated "as travelling easily, without jolting men's bodies or hurrying them along," which the obnoxious coaches did at four miles an hour. In 1673, travellers were kept a week on the road between London and Exeter, the fare being forty shillings sterling in summer, and forty-five shillings sterling in winter; the same fare was charged from London to Chester or York. In 1678, a six-horse coach took six days to perform the journey between Edinburgh and Glasgow. At the end of the seventeenth century, the stage-coach, with six horses, occupied two days in the journey from London to Cambridge, fifty-seven miles; and fifty years later, the journey to Oxford consumed the same time. Travelling by night was first introduced about 1740, not without opposition

from those who foresaw ruin in any departure from old practice. Hogarth's picture, "The Country Inn Yard," brings before us the ordinary coach of the period. It underwent alteration from time to time, as fancy or convenience dictated. In 1750, the "Alton and Farnham" machine was started with a wicker basket slung behind for the outside passengers. During the first quarter of the present century, through the exertions of Telford and Macadam, and the improvement in wheeled vehicles, the advancement in the facilities of transportation was rapid, and at the close of the period last mentioned, a superior mail-coach system was in successful operation in England and other parts of Europe. For example, the mail-coach between London and Edinburgh, a distance of four hundred miles, for some time before the introduction of railroads, usually performed the trip in forty-three hours; four horses were employed, which were changed every eight miles, thus requiring two hundred for the whole journey.

In this, as in the mother country, the progress of easy transit was slow. Although beaten paths marked the way between certain localities, still among the first adventurers and settlers there was little attention paid to the opening or working of roads. At a later period the sturdy pioneer who ventured inland from a seaport town with his family and household effects, after procuring one of the usual covered wagons, could only shape his course by following the Indian "trail" to the desired locality. However, during and after the war of the revolution, many of these trails, from a variety of causes, had become tolerably fair roads. As late as 1824, the stage-coach between New York and Philadelphia made weekly trips, the journey either way consuming thirty hours, the fare was $8. Who of the older inhabitants does not remember the original style of Pennsylvania wagons, with their hoop covered tops, and four, six, eight and sometimes even ten horses? something of the same kind is rarely seen at the present day, but they have been modernized—degenerated—they are not the familiar acquaintances of the days of our youth. Until within some thirty years, for land carriage, these were almost the only facilities for the transportation of the wares, products and commodities of the manufacturer, the merchant, the farmer and the mechanic. The utmost speed attained with them rarely exceeded two miles per hour, and they usually consumed four or five days in conveying a ton of goods between the two cities last mentioned.

We have thus sketched the different modes of land carriage for the transfer of persons and property, until between thirty and forty years ago, when the wonderful power of steam, with the appliance of skilful mechanism, began to be more fully developed. Steam, the power of which an eloquent lecturer, in 1832, eulogized thus:—"It is on our rivers, and the boatman may repose on his oars; it is on the highways, and begins to exert itself along the course of land conveyance; it is at the bottom of the mines, a thousand feet below the earth's surface; it is in the mill and in the workshop of the trades. It rows, it pumps, it excavates, it carries, it draws, it lifts, it hammers, it spins, it weaves, it prints." Yes, it has truly become one of the most subservient agents of man. But who dare estimate its term of sway? The public mind is already prepared for quite as startling announcements, as would that be, which proclaimed its successor.

What travelling was, even fifteen years ago, is, and each day becomes more and more, matter of history. Except in the little frequented sections of the country and on short routes, stage coaches and wagons have materially disappeared. Having superceded less perfect machinery, they in turn were set aside in accordance with the aims and requirements of the age.

(To be continued.)

For "The Friend."

John Banks.

As some useful hints may be found in the following epistle written from his prison-house, I would submit it for insertion in "The Friend." The support of church order, and keeping close to one another in the unity and fellowship of the gospel, were never more needed than at the present time.

"Dear Friends and Brethren,—In all your meetings together to do service for the Lord, his truth and people, and to see that good order be kept in the churches of Christ, wait diligently to be endowed with power and wisdom from above, which is pure and peaceable; that by the same you may be guided to judge of, and determine all that you have committed to your charge, whether in things spiritual or temporal. Thus good order, the blessed unity and fellowship that stands in the one Spirit, may be preserved amongst you, and every one have right done them, and true judgment in the power and wisdom of God may be set upon that which is unruly, stubborn and rebellious. For take notice, that every one who professeth to be a member of the body, or of the meeting, where things are to be done in unity, according to order, and settled and agreed to by the ancient and elder brethren of the church of Christ; every such an one ought to be subject and condescending one unto another, in things which are already settled, and established as to church order; and not any one to say in this or the other, I would be left to my freedom and liberty.

"Let all seriously consider, that if every one of you, when met together, should be of this mind, would not this tend to lay aside and break all order, rule and fellowship, as it is already settled according to Truth, in our men and women's meetings, as seen meet in the wisdom of God? Yes, surely it would. Wherefore I cannot but say unto you, for the clearing of my spirit, that care be taken to keep up the good order settled in the church, notwithstanding some in their particular judgment be against it. I speak in tenderness for the good and preservation of all who love good order, and unity with the people of God. Beware every one of reasoning above the simplicity of the Truth; for the apostle warned to take heed that you be not betrayed from the simplicity that is in Christ, as the serpent beguiled Eve. Dear brethren and sisters, be ye all careful to keep low and near the Lord, and then you will be kept near and dear one unto another; and the fountain of life and divine wisdom will be opened unto you, and the streams thereof will run plentifully among you; which will make all your meetings and undertakings sweet and comfortable, in the wisdom and power of God; and in the heavenly fellowship of his Spirit, all the disorderly, unsubjected, and unruly will be judged and cast out from among you.

"Wherefore, dear Friends, keep close together, as a body fitly framed together in unity, so shall nothing be lacking; for we need not to want anything among ourselves, that may tend to strengthen us against the enemy within, or his instruments without. He is strong and subtle, and they are many, all seeking to devour and break us asunder, which all the powers of hell and of death shall never be able to do, *as our care is to keep close together.* Let your continued care and mine be, that nothing upon any account may be given way to that may tend to do any hurt, or *make any breach amongst ourselves;* but as the Lord hath honoured us with his truth above many, to praise and glory, and our comfort, be it spok he hath preserved us in unity, and sweet comr nion together for many years. Oh, that we n still be considered as one man, of one heart a mind, to persevere unto the end, in that in wh we have begun, and thus far are preserved, liv to God, zealous for his name, truth and glory that through our careful settling and abiding u the rock and living root that bears us, we n bring forth fruit more abundantly, through t fresh springs of life, which will spring afresh i us, in and through Him, who is the fountain of our mercies, blessings, favours and preservatic —that living praises in our hearts and mouths our assemblies, may arise to the Lord, in a ser of life, being broken and tendered before him, bless, praise and magnify his holy and honoura name for our preservation in his truth near to hi self, and in love and unity one with anothe which is the living concern and prayer of yo brother, that you may be so preserved unto t end, amen. JOHN BANKS."

"From my prison-house, in Carlisle, the 29th of the Third mo., 1684."

Extract from Prescott.

An Auto de Fe.

The *auto de fe* ("act of faith") was the mo imposing, as it was the most awful, of the solemn ties authorized by the Roman Catholic Churc It was intended, somewhat profanely, has be intimated, to combine the pomp of the Rom triumph with the terrors of the day of judgmen It may remind one quite as much of those bloo festivals prepared for the entertainment of th Cæsars in the Coliseum. The religious import the *auto de fe* was intimated by the circumstanc of its being celebrated on a Sunday, or some oth holiday of the church. An indulgence for for days was granted by his holiness to all who shou be present at the spectacle; as if the appetite fi witnessing the scenes of human suffering require to be stimulated by a bounty; that, too, in Spai where the amusements were, and still are, of th most sanguinary character.

The scene for this second *auto de fe* at Valladolid, was the great square in front of the Church St. Francis. At one end a platform was raise covered with rich carpeting, on which were range the seats of the inquisitors, emblazoned with th arms of the Holy Office. Near to this was th royal gallery, a private entrance to which secure the inmates from molestation by the crowd. Opposite to this gallery a large scaffold was erected so as to be visible from all parts of the arena, an was appropriated to the unhappy martyrs wh were to suffer in the *auto.*

At six in the morning, all the bells in the cap tal began to toll, and a solemn procession was see to move from the dismal fortress of the Inquis tion. In the van marched a body of troops, t secure a free passage for the procession. The came the condemned, each attended by two fam liars of the Holy Office, and those who were t suffer at the stake by two friars, in addition, ex horting the heretic to abjure his errors. Thos admitted to penitence wore a sable dress; whil the unfortunate martyr was enveloped in a loos sack of yellow cloth,—the *san benito,*—with h head surmounted by a cap of paste-board of a con cal form, which, together with the cloak, was en broidered with figures of flames and of devils fa ning and feeding them; all emblematical of th destiny of the heretic's soul in the world to come as well as of his body in the present. Then came the magistrates of the city, the judges of th courts, the ecclesiastical orders, and the nobles c

land, on horseback. These were followed by members of the dread tribunal, and the fiscal, bring a standard of crimson damask, on one side which were displayed the arms of the Inquisi-n, and on the other the insignia of its founders, tus the Fifth, and Ferdinand the Catholic. ct came a numerous train of familiars, well unted, among whom were many of the gentry he province, proud to act as the body guard of Holy Office. The rear was brought up by an nense concourse of the common people, stimu-ed on the present occasion, no doubt, by the al desire to see their new sovereign, as well as the ambition to share in the triumphs of the *o de fe*. The number thus drawn together n the capital and the country, far exceeding at was usual on such occasions, is estimated by present at full two hundred thousand.

As the multitude defiled into the square, the uisitors took their place on the seats prepared their reception. The condemned were con-ted to the scaffold, and the royal station was upied by Philip, with the different members of household. At his side sat his sister, the late en, his son, Don Carlos, his nephew, Alexan-Farness, several foreign ambassadors, and the ncipal grandees and higher ecclesiastics in at-dance on the court. It was an august assem-of the greatest and the proudest in the land. t the most indifferent spectator, who had a rk of humanity in his bosom, might have turned h feelings of admiration from this array of ldly power, to the poor martyr, who, with no port but what he drew from within, was pre-ed to defy this power, and to lay down his life vindication of the rights of conscience. Some re may have been, in that large concourse, who red in these sentiments. But their number small indeed in comparison with those who ked on the wretched victim as the enemy of l, and his approaching sacrifice as the most ious triumph of the Cross.

The ceremonies began with a sermon "the ser-n of the faith," by the Bishop of Zamora. The ject of it may well be guessed from the occa-n. It was no doubt plentifully larded with ts of Scripture; and, unless the preacher de-ted from the fashion of the time, with passages m the heathen writers, however much out of ce they may seem in an orthodox discourse.

When the bishop had concluded, the grand in-isitor administered an oath to the assembled ltitude, who, on their knees, solemnly swore lefend the Inquisition, to maintain the purity the faith, and to inform against any one who uld swerve from it. As Philip repeated an h of similar import, he suited the action to the rd, and, rising from his seat, drew his sword from scabbard, as if to announce himself the deter-ned champion of the Holy Office. In the earlier os of the Moorish and Jewish infidels, so humi-ing an oath had never been exacted from the ereign.

After this, the secretary of the tribunal read ad an instrument reciting the grounds for the viction of the prisoners, and the respective tences pronounced against them. Those who re to be admitted to penitence, each, as his sen-ce was proclaimed, knelt down, and, with his nds on the missal, solemnly abjured his errors, l was absolved by the grand-inquisitor. The olution, however, was not so entire as to re-e the offender from the penalty of his trans-ssions in this world. Some were doomed to petual imprisonment in the cells of the Inqui-on, others to lighter penances. All were med to the confiscation of their property—a nt of too great moment to the welfare of the tribunal ever to be omitted. Besides this, in many cases the offender, and, by a glaring perversion of justice, his immediate descendants, were rendered forever ineligible to public office of any kind, and their names branded with perpetual infamy. Thus blighted in fortune and in character, they were said, in the soft language of the Inquisition, to be *reconciled*.

As these unfortunate persons were remanded, under a strong guard, to their prisons, all eyes were turned on the little company of martyrs, who, clothed in ignominious garb of the *san benito*, stood waiting the sentence of their judges—with cords around their necks, and in their hands a cross, or sometimes an inverted torch, typical of their own speedy dissolution. The interest of the spectators was still further excited, in the present instance, by the fact that several of these victims were not only illustrious for their rank, but yet more so for their talents and virtues. In their haggard looks, their emaciated forms, and too often, alas! their distorted limbs, it was easy to read the story of their sufferings in their long imprisonment, for some of them had been confined in the dark cells of the Inquisition much more than a year. Yet their countenances, though haggard, far from showing any sign of weakness or fear, were lighted up with the glow of holy enthusiasm, as of men prepared to seal their testimony with their blood.

When that part of the process showing the grounds of their conviction had been read, the grand inquisitor consigned them to the hands of the corregidor of the city, beseeching him to deal with the prisoners *in all kindness and mercy;* a honeyed, but most hypocritical phrase, since no choice was left to the civil magistrate, but to execute the terrible sentence of the law against heretics, the preparations for which had been made by him a week before.

(To be concluded.)

What Family Government is.

It is not to watch children with a suspicious eye, to frown at the merry outbursts of innocent hilarity, to suppress their joyous laughter, and to mould them into melancholy little models of octogenarian gravity.

And when they have been in fault, it is not simply to punish them on account of the personal injury you have chanced to suffer in consequence of their fault, while disobedience, unattended by inconvenience to yourself, passes without rebuke.

Nor is it to overwhelm the little culprit with angry words; to stun him with a deafening noise; to call him by hard names, which do not express his misdeeds; to load him with epithets which would be extravagant if applied to a fault of tenfold enormity; or to declare, with passionate vehemence, that he is the worst child in the world, and destined for the gallows.

But it is to watch anxiously for the first risings of sin, and to repress them; to counteract the earliest workings of selfishness; to repress the first beginnings of rebellion against rightful authority: to teach an implicit and unquestioning and cheerful obedience to the will of the parent, as the best preparation for a future allegiance to the requirements of the civil magistrate, and the laws of the great Ruler and Father in heaven.

It is to punish a fault because it is a fault; because it is sinful and contrary to the commands of God, without reference to whether it may or may not have been productive of immediate injury to the parent or others.

It is to reprove with calmness and composure, and not with angry irritation; in a few words, fitly chosen, and not with a torrent of abuse; to punish as often as you threaten, and threaten only when you intend and can remember to perform; to say what you mean, and infallibly do as you say.

It is to govern your family as in the sight of Him who gave you authority, who will reward your strict fidelity with such blessings as he bestowed on Abraham, or punish your criminal neglect with such curses as he visited on Eli.—*Religious Herald.*

Selected.

"I loved to attend religious meetings, especially those for discipline, and it was clearly shown me, that all who attend those meetings should inwardly wait in great awfulness, to know the immediate presence of Christ the Head of the Church, to give them an understanding what their several services are, and for ability to answer the requirings of truth, for it is by the light and spirit thereof, that the Lord's work is done with acceptance, and none should presume to speak, or act without its motion and direction; for they who act and speak without it, do often darken counsel, mislead the weak, and expose their own folly, to the burthen and grief of sensible Friends. It was in great fear that I attempted to speak in these meetings, and as I kept low with an eye single to the honour of truth, I felt peace and inward strength to increase from time to time; and it is good for all who are concerned to speak to matters in meetings for discipline, in the first place to take heed that their own spirits do not prompt thereto, and to mind the time when to speak fitly; for a word in season from a pure heart is precious, and frequently prevents debates instead of ministering contention,—and when they have spoken to business, they should turn inward to feel whether the pure truth owns them, and in that rest, without an over anxious care whether it succeeds at that time or not; so Friends will be preserved from being lifted up, because their service is immediately owned; or if it should be rejected or slighted, in this inward, humble state, the labour is felt and seen to be the Lord's." *J. Churchman's Journal.*

THE FRIEND.

FOURTH MONTH 12, 1856.

We have before us the 27th Annual Report of the Inspectors of the Eastern Penitentiary of this State. It contains numerous tabular statements detailing facts of singular and often sad interest, regarding the convicts. It appears that at the close of 1855, there were 285 convicts in the Institution, and that the whole number admitted up to that time, since the admission of the first convict, Tenth mo. 29th, 1829, was 3359. We observe that of this number, 871, or more than one-fourth, were re-convictions, and that many of these had been imprisoned several times; 3 of them *seven*, and 2 *nine* times. Of the 871 re-convictions, but 340 were re-convicts to *this* Institution, the remaining 531 having been imprisoned elsewhere on their previous sentences

The object of imprisonment for crime is twofold; 1st, to reform the criminal, and rescue him from his downward course; 2d, to deter others from the commission of crime. The proper treatment of convicts, both during incarceration, and when they are discharged, in order to promote the first object, is a serious and responsible undertaking. Prison Discipline Societies, where they have the funds, and their labours are rightly conducted, may do much to promote this important object. The need of such labours was strikingly illustrated at a meeting of a remarkable character, held at London on the 12th of last month. It was con-

vened by Horace Mayhew, the author of London Labour and the London Poor. The following account of this meeting is taken, with some verbal alterations, from a letter from the London correspondent of one of our daily papers.

"It was an assemblage of Ticket of Leave Men, or Thieves who, having been sentenced to penal servitude for various terms, have, by good conduct while incarcerated, been presented with a ticket of leave, which sends them again into the world for the purpose of retrieving their character. No police were present, the commissioners, upon the application of H. Mayhew, having on this occasion withdrawn them from the immediate vicinity. About fifty convicts attended, and after an address from H. Mayhew, several spoke. One man, Peter, speaking with remarkable fluency and great propriety of expression, narrated his history; it was a painful one, commencing with poverty, proceeding with thieving, progressing to penal servitude, followed by liberation under a ticket to leave, starvation and return to thieving, a desire to reform, but the practicability surrounded by apparently almost insuperable difficulties. Knocked about by the police, coolly received by the public, he knew not where to get a meal's victuals, or how, he seemed to think, but by stealing; but if the encouragement held out by H. Mayhew were only to be realized, he would never put his hand again to a dishonest action. A little costermonger spoke next. The narration was much of the same character. His release upon a ticket of leave had been to place him under the surveillance of the police, which, but for some determination and resolution on his part, would again have driven him back to mal-practices, but he was just able now to 'crack a crust,' and he would never go back to thieving. A stonemason, who had been fortunate since his liberation to get into full work, expressed his sympathy with those of his class, whom he knew to be suffering the direst misery. An elderly man related a piteous history; a blacksmith and others all telling pretty much the same tale, that the inability to get employment on leaving prison compelled them, as they alleged, for mere life's sake to resort to their old crime of thieving. H. Mayhew closed this most remarkable meeting by stating that he would endeavour to form a committee of philanthropical gentlemen, with a view of raising a fund and establishing a society for their encouragement. He exhorted them to do their utmost on their own behalf, and show to the world that the efforts of others for their redemption would not be thrown away. There was a very general response affirmatively to his wish; and then this singular meeting, conducted throughout with the greatest order and propriety, separated."

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 22d ult.

The Paris Conference.—The Prussian representatives took their seats in the Peace Congress at the tenth meeting. The business of the Conference was understood to be closed, the terms of peace having been concluded upon. A committee of one representative from each of the Powers, was engaged in drawing up a formal treaty of peace.

FRANCE.—On the 16th ult., the Empress Eugenie gave birth to a son, to whom the name of Napoleon-Eugene-Louis-Jean-Joseph was given, with the title of King of Algeria. This event was made the occasion of great parade and ceremony, and of many demonstrations of rejoicing, not only in Paris but throughout France. On the 18th, the Senate and Legislative Corps waited upon the Emperor with their congratulations. The President of the Senate delivered the address to which the Emperor replied with much emotion. He called to mind that the Napoleon dynasty had emanated from the people; that it had experienced forty years of trial; and that the Imperial Prince was born in the midst of hopes of peace.

TURKEY.—The Divan, owing to the remonstrances of the merchants, had renounced the projected issue of 100,000,000 piastres of paper money. Rustori Pacha had been convicted of malversation, and sentenced to imprisonment, and to refund several hundred thousand francs.

RUSSIA.—The fortifications of Nicolaieff were being strengthened. General Luders had ordered all Russian officers who were on furlough, to return to duty. The Imperial foundry on the left bank of the Don, was closed, indicating the intention of Russia to abandon its maritime establishments on the Black Sea. There had been great mortality among the French troops in the Crimea. The armistice had produced a profound sensation of joy in the armies. It was stated that two divisions of the British army under Sir Colin Campbell, will proceed immediately to Canada.

DENMARK.—The Sound Dues question had excited some alarm in Europe, for fear of its causing another war. The London Times learns, with satisfaction, that the United States Government has determined to prolong the obligations of the treaty just about to expire, for a further term of two months, on the express understanding that something will be done, in the meantime, towards the abolition of the Sound Dues.

GREAT BRITAIN.—The American Minister, Buchanan, introduced his successor, G. M. Dallas, to the diplomatic corps, on the 17th, and transferred the charge of the Embassay to him. The Ex-Minister would take passage for the United States, about the middle of this month. Parliament had adjourned. The advices from the manufacturing districts were satisfactory. The Bank of England had reduced its rate of interest to a uniform rate of six per cent.; the bullion in its vaults had slightly increased. Consols were quoted at 92¼ a 92⅜.

Liverpool Market.—Cotton, fair qualities were scarce, and had improved; the lowest had declined 1-16*d.* The range was from 5 13-16*d.* to 6¾*d.* Breadstuffs were unsettled in price, and dull. Western Canal flour, 31*s.* a 32*s.*; Ohio, 36*s.* a 36*s.* 6*d.*

AFRICA.—Advices from Cape Coast to Second mo. 25th, state that the Coast was healthy. There had been disturbances in which thirty natives had been killed, and one hundred wounded.

INDIA.—Advices from Bombay to Second mo. 16th, state that the Sanduli insurrection had been renewed.

MEXICO.—The Revolutionists besieged at Puebla, surrendered to the Government forces on the 22d ult.

CENTRAL AMERICA.—The Government of Costa Rica has made a formal declaration of war against the Walker government in Nicaragua. The latter had been reinforced by the arrival of 300 Americans, and had despatched a force of 600 men under Col. Schlessinger, against the Costa Ricans. The Government of Costa Rica had issued an address to the people of Central America, calling on them to rise and destroy the American invaders. An Ambassador from San Salvador had arrived at Grenada, with despatches of a peaceful character.

UNITED STATES.—The net amount in the Treasury, on the 24th ult., subject to draft, was $22,372,285. The Department at Washington have issued 112,794 land warrants, under the act of 1855. The applications received amount to 242,000, of which 170,000 have been examined. A bill has passed both houses of Congress, appropriating $300,000 for restoring and maintaining peaceable relations with the Indians of the Pacific coast, and $200,000 for the purchase of gunpowder. A joint resolution has been passed, providing for enlarging the Custom-house, Post-office and Federal Court building at Buffalo, N. Y. The Kansas investigating committee has proceeded to the Territory to commence their labours. The debate on Kansas affairs and collateral questions, continues in the Senate.

Philadelphia.—Mortality last week, 213. During the first three months of 1856, the slaughter of animals for the supply of the city, exclusive of those killed and sold by farmers, was as follows: 14,620 beef cattle, 70,000 sheep, and 24,450 hogs. During the Third month, the mean temperature was 29.76, which is nearly 10° below the average of the last twenty years. The highest was 45° on the 23d, and the lowest 0° on the 10th. The navigation of the Delaware was resumed above the city on the 27th, after a suspension of nearly three months. Persons crossed on the ice as late as the 15th of Third month. The coinage at the U. S. Mint in this city, for the Third month, was in 3,170,615 pieces, of the value of $3,443,098. The steam packet line between Philadelphia and Liverpool, which had suspended its communication between the two cities, on account of the war, is about resuming its regular trips. The steamer City of Baltimore is to leave Liverpool on the 23d inst., for this city, and the Manchester and the City of Pittsburg were to follow in regular succession.

New York.—Mortality last week, 411, of whom 147 were adults and 264 children. The exports of specie for the week amounted to $1,248,922. On the 5th, sales of good red wheat were made at $1.65 a $1.70; white, $1.95.

Miscellaneous.—Military and Naval Force of Europe.—According to a statement in "La Presse," the military land force of all the powers of Europe form an effective total of 4,162,214 men, of whom 2,581,282 belong to the six powers represented in the Congress of Paris. The naval forces form a total of 2815 ships, of which 600 are steam vessels.

Emancipation.—The Cin. Commercial of the 2d says, "Seventeen slaves emancipated by Mr. Shobarn, of Logan county, Ky., arrived here yesterday on the steam Telegraph. They were furnished with means to loc on a farm." A planter from Mississippi had arrived Hamilton, Butler county, Ohio, with a family of n persons which he desired to set free. The family c sists of a mother, with six sons and two daughte Three of the sons were said to be good mechanics, a another acted as an overseer.

The British Ship Resolute.—The British Governme have given up all claim to the ship Resolute, now ly in the harbour of New London, Conn., and she is to sold, with all her fixtures, for the benefit of the part concerned in her recovery.

The Typhus Fever rages in Southern Russia, partic larly in those places which are near the theatre of w Bakshiserai, Simpheropol, Kherson and Nicholaieff a almost empty. It is estimated that this pestilence h already carried off 100,000 men.

California Quicksilver.—In 1855, the exports of th article from the great mine at Santa Clara, amounted 1,951,242 pounds; value, $995,621. The mine belon to Robert J. Walker, Com. Stockton, and others.

The Steamboat New Jersey.—The Coroner's Ju charged with the investigation of the late disast after a long investigation and the examination many witnesses, rendered a verdict exonerating the a ficers of the boat from censure, but they find "that th steam ferry-boat New Jersey, by the burning of whic these deaths by violence occurred, was entirely unfit f the transportation of passengers; that she was inad quately manned, her boiler worn out, leaky and defe tive; that there were no boats, life-preservers, float spare plank, buckets on deck, or any other means pr vided for the escape of passengers, in case of fire, coll sion, explosion, or any other emergency."

Failures in Europe.—The English papers chronic many failures among the grain merchants within th last two months. In Glasgow, where the stock of grai was proportionately above that of any other place, ther are reported thirteen cases of insolvency, involvin liabilities to the extent of two millions of dollars.

RECEIPTS.

Received from Jehu Fawcett, agt., O., $36, for Jo Warrington, $4, vols. 28 and 29, for Daniel Bolton, $ vols. 28 and 29, for J. W. Coffee, Benj. Antram, Josia Fawcett, $2 each, vol. 28, H. Bolton, Isaac Bonsall, S Shaw, Jehu Allman, Job Warren, R. B. Faucett, H. W Harris, $2 each, vol. 29, Jos. Stratton, $2, to 41, vol 29, Mahlon Whinery, $2, to 12, vol. 30, Josh. Coppock $2, to 29, vol. 30, Abm. Bonsall, $2, to 26, vol. 30; fro John Brantingham, Io., $2, vol. 27; from T. W., Jo for S. C. Sharpless, $2, vol. 28, John Thomas, $4, vols 28 and 29; from Willis P. Smith, O., $2, to 26, vol. 29

FRIENDS' HORSES.

Friends coming to this city to attend Yearly Meeting or at other times, on the service of Society, who put u within the limits of the Monthly Meeting of Friends o Philadelphia for the Northern District, can have their horses accommodated at the stables of William A Scheetz, (Montgomery Hotel,) North-east corner of Sixth and Willow streets.

Philad., Fourth mo. 10th, 1856.

BIBLE ASSOCIATION OF FRIENDS IN AMERICA.

A Stated Annual Meeting of the Bible Association o Friends in America, will be held at the Committee-room Arch street Meeting-house, on Seventh-day evening Fourth month 19th, 1856, at 8 o'clock. Friends generally, of both sexes, are invited to attend.

JOHN CARTER, Sec'ry.

HAVERFORD SCHOOL ASSOCIATION.

The stated annual meeting of the Haverford School Association, will be held at Committee-room, Arch street Meeting-house, on Second-day afternoon, at 4 o'clock Fifth mo. 12th, 1856. CHARLES ELLIS, Sec'ry.

Friends' Boarding-School for Indian Children, at Tunessassah.

A man Friend is wanted to aid in carrying out the concern for the improvement of the Indians.

Application may be made to JOSEPH ELKINTON, 377 S. Second street.
THOMAS EVANS,
Philad., Eleventh mo. 1st, 1855. 180 Arch street

PRINTED BY KITE & WALTON,
No. 3 Ranstead Place, Fourth above Chestnut street.

THE FRIEND.

A RELIGIOUS AND LITERARY JOURNAL.

VOL. XXIX. SEVENTH-DAY, FOURTH MONTH 19, 1856. NO. 32.

PUBLISHED WEEKLY.

Price Two Dollars per annum, payable in advance.

Subscriptions and Payments received by

JOHN RICHARDSON,

AT NO. 50 NORTH FOURTH STREET, UP STAIRS,

PHILADELPHIA.

Postage to any part of Pennsylvania, for three months if paid in advance, three and a quarter cents; any part of the United States, for three months, if paid in advance, six and a-half cents.

From the Quarterly Review.

Zoological Sketches.

To furnish every possible link in the grand process-ion of organized life, is the aim of the science of zology. Its professors have explored the wilds of frica, and have penetrated far into the interior of outh America; have endured the last extremities f hunger and thirst to catch some curious hum-ing-bird; and have been consumed by fevers to e very socket of life, in order to pin an unknown ttle, or to procure some rare and gorgeous-coured fly. The passion for this science seems to ve long dwelt in the English race; our love of ld-sports, and keen relish of rural life, coupled th a habit of minute observation, have all had a tdency to foster an acquaintance with the beasts the field and the fowls of the air, and scarcely a llage but boasts of some follower of White or aterton. This taste we carry with us to our vast onial possessions, and to that chain of military sts whose morning guns echo round the world. ith such splendid opportunities for observing and llecting animals, we have succeeded in gathering gether a menagerie which is by far the first in xistence, and which includes typical forms of most ling things—from the chimpanzee, in whose face d structure we trace the last step but one of the dest form of mammal, to the zoophyte, which akes hands with the vegetable world.

Ancient Rome, it is true, in her degenerate days ntessed vaster collections of animals, and saw ppotami, ostriches, and giraffes, together with e fiercer carnivoræ, turned by hundreds into the ena. But how different the spirit with which ey were collected! With the debased and pro-gate Roman emperors the only object of these body shows was to gratify the brutal appetite of eir people for slaughter; with us the intention is display the varying wonders of creation.

Most of our readers in the full flush of summer ve leaned over the balustrade of the carnivora rrace. From this elevated situation the whole an of the south side of the grounds is exposed. o his right, fringing a still pool whose translucent aters mirror them as they stand, the spectator sees e collection of storks and cranes: more immediately front of him softly tread the llamas and alpacas the beasts of burthen of the New World: farther, ain, we see the deer in their paddocks, and beyond e sedgy pools of the water-fowl, set in the midst of aceful shrubberies which close the Gardens in om the landscape of the Regent's Park. Passing er to the northern side of the terrace he sees the eagle aviary, tenanted by its royal and solitary-looking occupants; the otters swimming their merry round, and perchance the seal flapping beside his pool; while the monkeys with incredible rapidity and constant chatter swing and leap about their wire enclosure. Immediately beneath him the Polar bears pace to and fro, or, swaying their heads, walk backwards with a firmness which a lord chamberlain might study with advantage; and close at hand the long neck of the "ship of the desert" is seen sailing out from the gateway of the pretty clock-house. That the dread monarch of the forest and the other "great cats" are beneath his feet, he is made aware by angry growls and the quivering sound of shaken iron bars, as the keeper goes round with his daily beef-barrow. No one can help feeling a certain sense of strangeness at seeing these creatures of all climes scattered amid a flourishing garden—to witness beasts, ensanguined in tooth and claw, impatiently pacing to and fro between banks of scarlet geraniums or beds brilliant with the countless blooms of early dahlias—or, still more oddly, to witness birds of prey which love to career in the storm surrounded by monthly roses. Had it been possible to have given each class of bird and animal its appropriate vegetation it would doubtless have been preferable; but such an arrangement was manifestly impossible.

Descending from this general survey, the long row of dens which run below the terrace on either side are the first to attract the visitor's attention. Before this terrace was constructed in 1840, the larger carnivoræ were cooped up in what is now the reptile-house. The early dens of the establishment form a good example of the difficulty Englishmen experience in suiting themselves to altered circumstances. On the first formation of the Gardens the Society seems to have taken for its model some roving Menagerie, as many of the houses of the beasts were nothing better than caravans dismounted from their wheels, and the managers encamped their collection in a fashion little more permanent than Wombwell would have done upon a village green. It was speedily found that the health of the felidæ suffered materially from their close confinement, which did not even admit of the change of air experienced in the travelling caravan. In fact, the lions, tigers, leopards, and pumas, did not live on an average more than twenty-four months. To remedy this state of things the terrace dens were constructed, and, rushing from one extreme to the other, tropical animals were left exposed to the full rigour of winter. The drifting rain fell upon their hair, and they were exposed in cold, wet weather to a temperature which even man, who ranges from the torrid zone to the arctic circle, could not resist unprotected. The consequences were manifested in the increase of inflammatory lung diseases, and it is now found necessary to protect the dens by matting and artificial heat from the extreme cold and damp of the winter months. In the summer the exposure suits them admirably, and it must be confessed that the tigers look only too fat and comfortable. One of the most interesting cages is that which contains a family party, consisting of a mastiff with the lion and his mate. They were brought up together from cubhood, and agree to a marvel; though the dog would prove little more than a mouthful for either of his noble-looking companions. Visitors express a vast deal of sympathy for him, and fancy that the lion is only saving him up, as the Giant did Jack, for a future feast. But their sympathy, we believe, is thrown away. "Lion" has always maintained the ascendency he assumed when a pup, and any rough handling on the part of his huge play-fellows is immediately resented by his flying at their noses. Although the dog is allowed to come out of the den every morning, he shows a great disinclination to leave his old friends. It is, however, thought advisable to separate them at feeding-time. Both the lion and lioness are of English birth, and it is singular that out of the great number that have been born in the Society's Garden full fifty per cent. have come into the world with cleft palates, and have perished in consequence of not being able to suck. If the keepers were to fill their nostrils with tow we fancy they could accomplish this act, as well at least as children who are suffering from cold in the head. Although the male is not yet fully grown, he is sufficiently developed to show the difference between the African variety to which he belongs and the East Indian specimen at the other end of the terrace. Our young Cape friend has a fine mane and a tail but slightly bushed at the top, which droops towards the ground. The full-grown animal from Goojerat, is, on the contrary comparatively maneless, and his tail takes a short curl upwards at the end. The caudal extremity of both is furnished with a rudimentary claw. This little appendage was supposed by the ancients to be instrumental in lashing the lion into fury, and Gordon Cumming informs us that the natives of South Africa believe it to be the residence of an evil spirit which never evacuates its post until death overtakes the beast and gives it notice to quit. The Goojerat or maneless lion is supposed to be the original of the heraldic beast we regard with such respect as a national emblem, but which foreigners maintain is nothing better than a leopard.

But why do we coop these noble animals in such nutshells of cages? What a miserable sight to see them pace backwards and forwards in their box-like dens! Why should they, of all the beasts of the forest, be condemned to such imprisonment? The bear has its pole, the deer its paddock, the otter his pool, where at least they have enough liberty to keep them in health; but we stall our lions and tigers as we would oxen, till they grow lethargic, fat, and puffy, like city aldermen. With half an acre of enclosed ground, strewn with sand, we might see the king of beasts pace freely, as in his Libyan fastness, and with twenty feet of artificial rock might witness the tiger's bound. Such an arrangement would, we are convinced, attract thousands to the Gardens, and restore to the larger carnivoræ that place among the beasts from which they have been so unfairly degraded. We commend this idea to —— Mitchell, the able secretary to the Society, who has shown by his system of "starring" how alive he is to the fact that it is to the sixpenny and shilling visitors who flock to the Gardens by tens of thousands on holidays that he must look to support the wise and liberal expenditure he has lately adopted.

On the other side of the terrace, in addition to

the leopards and hyænas, is to be found a splendid collection of bears, from the sharp-muzzled sun-bear (who robs a bees'-hive in a hollow tree as artistically as a London thief cuts a purse,) to the enormous Russian Bruin, the largest perhaps ever exhibited. "Prince Menschikoff," as he is called by the keepers, grew into exceeding good condition in the gardens at Hull, where it appears he chiefly dieted upon his brethren, the cannibal having consumed no less than five bears: and they appear to have had the same effect upon him as cod-liver oil upon a human invalid. His neighbours, the white Polar bears, contrast with him strangely in physiognomy and form; their heads, sharp as pole-cats', seem fashioned like cutwaters to enable them to make their way in the sea, and if they would lift their huge paws we should see that they were clothed almost entirely with hair, to aid them in securing a firm footing on the ice. The largest of these beasts managed to get out of his enclosure before the top of it was barred in; but he was peaceably led back again. Indeed, even the wildest of the beasts, after a little confinement, seem so frightened at recovering their liberty that they easily allow themselves to be recaptured.

Last year the Felidæ alone consumed beef, mutton, and horseflesh to the value of £1367 19s. 5d. This sum is entirely irrespective of the fish, snakes, frogs, and other "small deer" given to the birds and inferior carnivoræ. They all live here like gentlemen, emancipated from the drudgery of finding their daily food. They have their slaughter-houses close at hand in the Gardens, where sheep, oxen, and horses are weekly killed expressly for them. Some of them will only eat cooked meat. Soon after the establishment of the Gardens, experiments were made as to the best manner of feeding them, which proved that, while they gained flesh and continued active upon one full meal a day, they lost weight and became drowsy on two half meals. In the endeavour to follow nature still closer, they were dieted more sparely, and even fasted at certain seasons. This treatment, however, resulted in a catastrophe—a female leopard and puma killing and eating their companions: a strong hint for fuller rations, which was not neglected.

(To be continued.)

For "The Friend."

The following extract of a letter from a highly valued correspondent, I offer for insertion in the Friend, believing that the remarks in relation to a mere common-place expression of sympathy on the occasion of the death of friends, will find a hearty response in the bosoms of many who have been so circumstanced. * *

"In being brought into feeling of deep sympathy for the afflicted, I have often found my lips sealed in silence, and have had to think of Job's friends (although accounted miserable comforters in the end) when they first saw the intensity of his grief, they rent their mantles and sat down seven days and nights without speaking a word unto him; and hence I have been willing to suppose my inadequacy arose to express myself by letter on a subject so painful, and a trial so unexpectedly meted out. I have sometimes heard many words uttered in visits of condolence or sympathy, and I have thought it would have been better, if like Elihu, the speakers had waited until the Spirit within constrained them. How much we have had to teach us where our dependence should be placed; yet it is hard for us naturally, to do other than lean somewhat at least upon the services of those whom the Master has equipped with his spiritual armor, who have shown themselves valiant in his warfare, and whose bows have abode in strength. While we know He can as availingly show forth his glory and the greatness of his might, through a chosen little band, as through Gideon's whole host, it becomes us not to repine, but rather that we give the more diligence that we may be of that people, among whom his name may be found, that in the final close, we too may receive the reward of "well done."

Early Settlements of Germans in the U. States.—The Mennonites of Switzerland having in 1707 secured by purchase ten thousand acres of land on the stream called the Pequea, [Pennsylvania,] commenced in 1711 a very large emigration, which continued until 1728. They required and purchased the valley of the Connestoga, and Lancaster county became the home of the Mennonites. These were followed by the "Tunkers," a sect driven from their homes in Southern Germany. In 1719–20 they settled near Germantown and Lancaster. Many of their descendants are now to be found in Virginia. In 1734, about one hundred families came from Silesia and settled in Pennsylvania. They were followers of Caspar Schwenckfeld, who opposed certain doctrines of the Lutherans. In 1732 a few Hernhutters were found in Pennsylvania. In the winter of 1735–36, one hundred and seventy Moravians were conveyed to Savannah, in the same vessel with Oglethorpe, Wesley, and Whitefield, where they built a town, to which they gave the name of Ebenezer. In 1738, however, they removed into Pennsylvania, and founded near Easton a school for negroes, which was the first, and for a long time the only one in America.

The great body of these early emigrants had come from the valley of the Rhine, from Switzerland, and from Swabia, and had settled in New York, New Jersey, Delaware, Pennsylvania, and Northern Maryland. Those of kindred sympathies and pursuits gathered together. The town of Reading, in Pennsylvania, was almost entirely composed of Lutherans, and Lancaster of Mennonites. New York was the home of the members of the Reformed Church. Baltimore and Berks county attracted the Roman Catholics. The same types of religious character exist in a great degree to the present day. Many Germans, however, were enticed by Law's agents to Biloxi, near Mobile, where they soon fell a prey to devouring fevers. Others were planted at St. Charles, above New Orleans. They gave the names to the Lac Allemand and the Bayou Allemand.

For "The Friend."

Yearly Meeting.

The time of our annual gathering is drawing near, and let us query with ourselves whether our minds are pre paring for it? Are we seeking after that preparation of heart which is of the Lord, having our own wills brought into subjection to the Divine will; desiring that the Lord's will may be done on us, and that we, through his mercy, may be favoured to conduct the weighty affairs of the Church to his honour and to the praise of his ever excellent name? It is only as we are furnished with the ability that God gives, that we can move rightly in his cause. Let us then be concerned individually, to cry mightily unto Him, that he may favour us in mercy with a measure of his power.

We profess to believe that those who are rightly concerned to seek after this power, will witness the truth of the promise, "As thy day is, so shall thy strength be," and that we shall not take thought before-hand what we shall speak, having faith that if our minds are rightly directed, the Holy Ghost will teach us in the same hour what we ought to speak. Premeditated planning, let the end designed be ever so desirable, is certainly a practical depr ture from the faith of our forefathers in the Tru

Do we not believe that the Lord is our God all-po erful, and that with him there is neither variablene nor shadow of turning? His power remains to be t same that it ever was, and he is still able to cau the waters to stand on heaps that his people m pass over dry shod. Yet it is only as we are w ling to rely upon him and leave the issue of things in his hand, that we can expect to recei help from his sanctuary. It is those who *trust* the Lord that shall be as Mount Zion which sh never be removed, but abideth forever. Let then be willing to trust in the Lord, and not le on our own understandings, for the Most High ha declared through his prophet Isaiah, (chap. xxi ver. 14, 15,) "Therefore behold I will proceed do a marvellous work among this people, even marvellous work and a wonder: for the wisdom the wise men shall perish, and the understanding their prudent men shall be hid. Woe unto the that seek deep to hide their counsel from the Lor and their works are in the dark, and they say, wh seeth us? and who knoweth us?"

The Great Head of the Church will not own th which is not of his own preparing: he will not gi his glory to another, or his praise to graven image Surely it will be in vain for poor weak man in h own will and time, to fashion or contrive an thing in his own mind. God will not bestow h praise upon any graven image, however much may resemble the Truth itself.

The day cometh that will try every man's wor of what sort it is. "For God shall bring ever work into judgment with every secret thing, whethe it be good or whether it be evil." Oh, that w were all practical believers in the doctrines we pr fess. It is an easy matter for us to say that we a sound in the faith, and the enemy may, perhap persuade us that we are, whilst it is manifest tha many are not sound in practice, but are gradual going aside from the pure teachings of Christ unerring Spirit, into the corrupt reasonings of fles and blood. It is to be feared that the grand adve sary will lead many out at this door; he cares n how much we profess to believe in the efficacy Divine Grace, so that we are not under its influenc and government. It will not avail us anything ho much soever we profess to act under right authorit if we are not submitting to Him whose prerogativ it is to rule in his Church; for what is professio without possession? What will it avail any of u to say that we are firm believers in all the doctrine and testimonies of our early Friends (whose do trines were those of Christ and his Apostles) whil it is evident that we have not come to the place true waiting in the silence of the flesh; in whic condition the Lord manifests his will by the inshin ing of his blessed Light upon our understandin This is the Light in which our early Friends we concerned to walk in strict obedience to what th Lord required at their hands. They knew in whom they believed, and that his power was able to su tain them. O, that such was more our condition this day, and that we may be preserved from seek ing to cover ourselves with any other covering tha the Lord's Spirit; for those who do seek to cove with any other covering, will find it to be too narro for them.

Chester County, Fourth mo., 1856.

American Marbles.—The War Departmen having advertised for specimens of American ma ble, with a view of selecting such as would answe for the ornamental parts of the capitol extension, large number have been sent to Washington, near all of which are considered fit to be used. A re

ottled marble from Tennessee, and a verd antique om Vermont, are especially noticed—the latter of hich is capable of a higher polish than any known arble. The most remarkable specimen, how- er, is a marble from Frederick county, Maryland, hich is of very fine grain, with a pure white ound, on which, in rich profusion, are spread own, purple, yellow and bright red clouds. he collection of so large a number of beautiful arbles in the capitol will serve to give the world good idea of the capabilities of the country in s line.

Transportation of Passengers and Wares.

(Continued from page 246.)

From the roads of the past we turn to the roads f the present. What was the origin of the latter? ccording to certain writers, we should find it by a dy of the ancient Egyptian hieroglyphics. Some- ng, however, more to the purpose than hierogly- hics occurs in Roger North's book already quoted: "Another remarkable thing," says Roger, refer- g to the neighbourhood of Newcastle-on-Tyne, s their *way-leaves;* for when men have pieces of ound between the colliery and the river, they sell ve to lead coals over their ground; and so dear t the owner of a rood of ground will expect £20 annum for this leave. The manner of the car- ge is by laying rails of timber from the colliery wn to the river, exactly straight and parallel, d bulky carts are made with four rowlets fitting se rails, whereby the carriage is so easy that one rse will draw down four or five chaldrons of coal, d is an immense benefit to the coal merchant." is account, as is obvious, refers to a mode of trans- rt already established, and we may believe that ilar contrivances would sooner or later be made ailable in other district; but we meet with no bsequent instance until 1738, when a railroad s laid down from Cockenzie to the coal pits of anent, across the ground on which, some years r, the Highlanders put General Cope to flight, d won the famous battle of Prestonpans. A por- n of the line, which may still be traced, was select- as a position for the English cannon. About the ne time iron trams were laid down in the White- en collieries. The practice had been, as describ- by Roger North, to make the rails of wood, and them parallel on cross-pieces called sleepers, im- dded in the earth. Thin plates of iron were some- es nailed on to protect those parts most exposed wear—a precaution which could scarcely have ed to suggest the idea of rails made entirely of n. These were first introduced in Coalbrookdale, ere in order to keep the furnaces at work during lack season, a number of bars, five feet long, r inches wide, and one and a half inches thick, re cast to be used as rails instead of wood, with intention of taking them up for sale in case sudden demand.

During the whole of the eighteenth century divers periments and improvements were made in the Bri- coal districts in the construction of rail, or, as they re then called, *tram-ways,* which finally resulted in being universally adopted, and something in form the present T rail was arrived at. The first d that was employed in the conveyance of pas- gers was the Stockton and Darlington—finished 1825. It was originally constructed for the nsportation of coal, and is twenty miles long. first the wagons were drawn by horses, and such s the effect of easy carriage, that the price of coal Stockton fell from eighteen shillings to eight llings and six pence per ton. Lead was carried m the interior to the ships at greatly reduced es, and a brisk trade in lime sprung up which had not before existed. Shortly after the opening two coaches were placed on the line for the convey- ance of passengers—large roomy vehicles to carry twenty-six passengers as a regular load, and in ex- traordinary cases, half as many more—an addition which in no way interfered with the speed of the journey. The coaches had no springs, and were intended to run backward or forward without being turned. A block of wood made to press against the tree of the wheels, by means of an iron lever within reach of the driver, enabled him to check the motion, or stop suddenly when required. Ten miles an hour was the usual speed, and seemed scarcely to require an effort from a single horse that drew the load, so seldom was there any strain on the traces; and the smooth and equable motion of the coach was a constant theme of congratulation among the passengers. The line originally consisted of a single pair of rails, with sidings at frequent intervals, at which vehicles, or coal trains, passed each other. Traffic became at once so lively on this short road, that a fair dividend was earned the first year. An inter- course and trade seemed to arise out of nothing, and no one knew how; and altogether the circum- stance of bustle and activity which appeared along the line, with crowds of passengers going and return- ing, formed a matter of surprise to the whole neigh- bourhood. Such was the birth of the infant which in thirty years has grown to be a tremendous giant.

In the following year, two of Stephenson's loco- motives were employed in the coal transport on the line, in addition to the horses. It was no uncom- mon sight to see one of these engines drawing behind it a train of loaded wagons, weighing ninety-two tons, at the rate of five miles an hour. In those days steam whistles had not yet come into use; and the firemen, to give notice of their approach after night- fall, threw up high into the air, from time to time, a shovel full of red hot cinders, which could be seen at a considerable distance by those moving in the opposite direction. Without a load, the speed of the engines was, not unfrequently, fifteen miles an hour—a most exhilirating rate of travelling, which at that period was regarded as little less than mar- vellous.

The first railroad in the United States was con- structed in 1825, from the Quincy quarries to Ne- ponset river, a distance of three miles. It was used solely for the transportation of the product of the quarries. The first road for the conveyance of pas- sengers was the Mohawk and Hudson, running from Albany to Schenectady, a distance of sixteen miles. The company received their charter from the State of New York, in 1826, and we believe a portion of the road was in operation in 1828. As in those days it was deemed impossible for a locomotive engine to ascend any considerable grade, and as there is a steep descent at both the Mohawk and Hudson rivers, at either end of the line, stationary engines were used on the inclined planes; since, however, portions of the road have been reconstruct- ed, and this difficulty obviated. This road is now the eastern section of the New York State Central railroad.

From 1830, the construction of railroads in every section of the country has been so rapid and exten- sive, that they are now familiarized to the sight and understanding of every reader; and without further comment on the history of roads, we will turn to the main intention of this paper—the history and de- scription of the Locomotive Engine.

(To be continued.)

How to wash windows.—The nicest article for washing windows is a deerskin, as no particles come off to adhere to the glass, and make it look as if washed with feathers. There is no need of anything larger than a hand basin for washing windows. The great splashing some people make in the exer- cise of their art is entirely useless, and is, moreover, deleterious. When the water is permitted to run in great quantities over the glass, it dissolves the putty, and soon loosens the panes from their setting, and also stains the glass. Two pieces of wash leather and a bowl of suds, are all that is neces- sary. Wipe the glass first with the wet cloth or leather, and after it becomes dry, with the clean cloth, and then it will look clear, and far more so than if rinsed with a dozen pails of water.—*Selected*

Selected.

Children understand Peace.

While visiting some of our infant schools a few days since, I enquired of the teacher if he had any idea of what the childen think about war. He sig- nificantly replied, that I might question his school and learn the views of his scholars for myself. I commenced:—

As I was coming here this morning, I saw, on the street below, a large brick building, of some- what singular appearance; everything about it appeared neat and in order; the blinds were all closed, and a high fence surrounded it. Can any of you tell me what building that was?

That's the Quaker Meeting-house, said a half dozen little fellows in the same breath.

But is there not a prettier name for them that than?

Yes, said one, they are called *Friends.*

But why are they called friends?

Because they won't fight.

Why not?

Because they know better.

But how came they to know better?

They learned it in the Bible.

Yes, but many people read the Bible, and yet fight.

Do you know that when armies and fleets meet to butcher each other, they have ministers on each side, to pray for success in their work?

I know it, but 'tis because they don't know any better.

It is not, said another, because they don't know any better, but because they won't do better.

But does the Bible say that it is wrong to fight?

It says what means the same, "Love your ene- mies."

Said another, it says in the 8th chapter of Mat- thew, "Blessed are the peacemakers for they shall be called the children of God."

But who are the peace makers?

All who try to make every body love each other?

But why are they called the children of God?

Because God loves them, as a father does his children.

Said another, because they love what he loves.

One little flaxen-haired, rosy-cheeked fellow said, my father is a captain and he says, I shall be a soldier. But if I am, I never will kill any body; I should rather be killed.

But how fine a thing to have a red coat, and cap, and sword, and be honoured as captains are?

The boy listened for a moment, and then said, "I can't help that; I would rather be shot, than kill any body: for God says, "Thou shalt not kill," and if we break his commandments he will punish us.

Reader, are you a teacher, or a parent, beware how you train up your children. Teach them while young that they are to love every body as they do themselves. If parents and teachers would do their duty, and show their children what war really is, their children would hate it, and give up their child- ish weapons, and disband their little companies. It is high time for christians to look at this subject, and cease from training their sons to be lovers of war.—*Belt.*

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 244.)

SARAH HEARN,

An inhabitant of Philadelphia, appeared in the ministry, early in the year 1702. She was somewhat advanced in years, and being diffident and embarrassed in what she deemed the requisition of duty, her first appearances caused some uneasiness to Friends. She appears to have received the plain dealings of her well wishing admonishers with humility, and endeavoured to improve thereby. As she in simplicity waited on the Lord for instruction and strength, her perturbation subsided, and she was enabled to express what he gave her to communicate to the satisfaction of the living in Israel. She lived to an advanced age, dying on the 11th of Ninth month, 1727. The meeting of ministers thus notices her death,—"Our ancient esteemed Friend, Sarah Hearn, deceased on the 11th, and was buried from the Bank Meeting on the 14th instant. She was of an orderly conversation; her public testimony was received in love; she lived and died in unity with Friends, and, we have cause to hope, is in peace and at rest with the Almighty in his kingdom."

THOMAS JONES.

Of this valuable and ancient Friend, the following character is given in his memorial,—"His conduct was exemplary, his ministry sound and edifying; inoffensive in his life and conversation, and zealously concerned for the promotion of the Truth. He lived in love and unity among Friends, and died the 6th of Eighth month, 1727, and was buried at Friends' burying-ground at Merion."

JOHN GOODSON.

Of this valuable elder of Philadelphia, who deceased Tenth month 26th, 1727, we have the following testimony,—"Meek and humble in his deportment, concerned for the promotion of Truth, well esteemed, and hath left a good savour behind him."

EDMUND ORPWOOD.

A valuable elder, residing near Frankford, deceased in the 85th year of his age, and was buried on the 19th of the Eleventh month, 1727. He was, Thomas Chalkley says, at the time of his decease, the oldest Friend of that meeting. The funeral was large, and the opportunity a favoured one, the gospel being powerfully preached by Rowland Wilson, a Friend from England, on a religious visit.

RICHARD LEWIS.

Richard Lewis resided at Germantown. He was a valuable minister of the gospel of Christ; who travelled in his Master's service, and was much employed by his brethren, in the affairs of religious Society. In a brief memorial of him, issued long after his death, his friends say that they cannot tell the time of his decease, but suppose it to have taken place about the year 1728. If so, he must probably have been long indisposed, for though we have abundant record of his labours and services in the church, up to the beginning of the autumn of 1722; they then suddenly cease.

JOANNA WILLIAMS.

Joanna Williams, the wife of George Williams, of Shrewsbury, was a sound and acceptable minister of Christ, who not only sought to walk in the blessed Truth herself, but laboured fervently that her children might know an establishment therein. Her friends testify, "She was a plain, honest-hearted woman; a diligent attender of meetings, both on First and week days; plain in dress, and circumspect in behaviour; she kept to the plain language, and endeavoured to keep her family so. She delighted in reading the Scriptures of Truth, was an industrious, loving, affectionate wife and mother, zealous for the honour of God, who gave her a gift in the ministry, edifying and comfortable to the honest-hearted. She was well beloved by most that were acquainted with her." Her decease took place the 1st of the Second month, 1728, being about 40 years of age.

JOHN COLLIER.

Of John Collier, a member of the meeting at Salem, West Jersey, who was buried the 3d day of the Third month, 1728, we have little to relate. From the account preserved of him, it appears that he secured a gift in the ministry, which, although small, was well received. He was diligent in the attendance of religious meetings, and lived and died in unity with his Friends.

PENTECOST AND ELIZABETH TEAGUE.

Elizabeth Janney came from Morley, in Cheshire, England, to Philadelphia, in the year 1698, and was for a number of years employed as a schoolmistress in this city. In the year 1710, she was married to Pentecost Teague, a minister of the gospel. Her husband was very useful in civil and religious Society.

In the year 1706, he informed his Friends of Philadelphia Monthly Meeting, that he had a pressing desire to visit his parents and friends in England. After an inquiry, a certificate was granted him, in which he is stated to be of blameless conversation, and zealous for the honour of Truth, and serving the Lord by a circumspect care and deportment. "Of late he has had sometimes a word of exhortation, and counsel in public among us, pressing to a holy life and circumspect concern for the honour of Truth in just and equal dealings with all men. We further certify that he hath been well received by us therein, though he hath not travelled much abroad hitherto in that concern. We doubt not, if it please the Lord to require anything of that or like service of him among you, but that you will also have like unity with him, and edification by his ministry in the blessed Truth. To the protecting and well governing arm of the Almighty, we dearly commit him, recommending him also to your notice, and in the love of our heavenly Father we tenderly salute you, and are your loving friends and brethren."

This certificate was granted in the Ninth month, 1706, but some circumstances delaying him, he did not visit England until the next year. He attended London Yearly Meeting in the year 1708, as appears by the epistle, from thence to Philadelphia Yearly Meeting. No memorial was issued concerning this dear Friend, who, it is believed, deceased in 1719 or 1720.

About the time of the decease of her husband, a dispensation of gospel ministry was committed to Elizabeth Teague. In the Seventh mo., 1720, Margaret Paine, a Friend in the ministry, from England, being in Philadelphia, and wishing a female companion in her travels through Maryland and other southern Provinces, Elizabeth Teague believed it would be right to accompany her. With the unity of her friends, she joined Margaret, and for more than half a year, they were industriously employed in their Master's service in Maryland, Virginia, and Carolina. Returning from thence, in the following Second month, Elizabeth produced a certificate of the unity of Friends with her religious service, from the meeting at Nancemond. She was brought under a concern to accompany her friend, Margaret, in her visit to the meetings to the eastward, and received a certificate of the unity of her friends with her journey, and her ministry. The certificate was addressed to Friends on Long Island, Rhode Island and New England. It appears from her returning certificates, that having laboured, in New England to the comfort and satisfaction of Friends, during the spring and summer of 1721, she returned home in the autumn of that year.

In the year 1723, in company with her friend Margaret Langdale, she visited the Yearly Meeting of Shrewsbury and adjacent parts, and on Long Island. We have the evidence of certificates to prove that her services were to the satisfaction of those where her Master led her. In the year 1725 with that able minister of the gospel, Abigail Bowles from Ireland, Elizabeth paid a second general visit to Friends in Maryland, Virginia and Carolina. They returned to Philadelphia, in the First month 1726, and at the meeting of ministers, in that month gave a satisfactory account of their labours in the arduous service.

Beside these more extended visits, Elizabeth Teague was industrious in her Master's business nearer home. Her period of service was short, and she seems to have been anxious that her day's work might be accomplished in the day-time. Her decease took place on the 10th of Third month, 1728. Her friends testify of her, that "she had an acceptable gift in the ministry," "and continued faithful to the end of her time."

(To be continued.)

The California Indian Reservations.

There are now established four Reservations. The Tejon was the first established in the State, at which there are about five or six hundred Indians. The improvements consist of a two story adobe building, 100 feet long, by 24 feet in width, and a mi two stories high, 36 by 24 feet, with over-sh wheel 25 feet in diameter; a dwelling house 20 b 60 feet, and some twenty small adobe houses fo Indians. There were in cultivation at this plac about eight hundred acres of land, five hundre acres of which were in wheat, and three hundred i barley, corn and vegetables.

The Frezno and King's river farms together have about seven hundred Indians, who have 1 cultivation quite six hundred acres of land. Th Indians on King's river, in addition to what th raised, by cutting grain on shares with the farme in that section, and from gleaning the fields, ha on hand near sixty thousand pounds of grain.

Nome Lackee, in Colusi county, there are fifte hundred Indians, who cultivate near one thousa acres of land. On this place there has been grow this year an abundant crop of wheat and barley.

On the new reserve on the Klamath river, the are over fifteen hundred Indians. These India have been under the charge of a sub-agent for t past six month, and were collected there at t time of the Indian disturbances in that section the State, during last spring. They are principal subsisting now upon fish, caught in Klamath rive and acorns, grass, seeds and berries, which th gather in great abundance in the mountains. Th are contented and obedient to the orders of t sub-agent, which promises to secure permane peace to all that portion of the State. Anoth reserve, allowed by the last Congress, is yet to established.

The Indians in Marin and Mendocino counti as far north as Cape Mendocino, numbering sev ral thousand, have been kept under control a management by the appointment of a special agen who resides among them, and the employment hunters to supply them with game and assist the in procuring fish and muscles from the coast.

In this manner peace and quiet have been pr

ed in that entire region of country, which is being rapidly filled up by actual settlers; and six months ago, it was dangerous for even ies of ten or twelve persons to travel through country.

The settled valleys and agricultural portions of state have been protected by the appointment special agents, who either gratuitously or for a ll compensation, have taken charge of the ians in their respective neighbourhoods. Through- the mining districts of the state, the Indians quiet, and many of them are securing a living working in the mines. Among them, also, al agents have been sent to ascertain their dition and to give them such temporary assis- ce as will be necessary to prepare them for ulti- e removal to the reservations.

There is another matter worthy of mention in ard to these reserves, and that is, that in the th, the country in the vicinity of the réserves, become occupied by actual settlers, and land v cultivated which had remained idle because he dangers to be encountered from the Indians. Klamath and Colusi counties the agricultural ds are now being rapidly filled up, the settlers ring no fears of molestation by the Indians. e same may be said of Mendocini, where thou- ds of acres of good land can be easily obtained, l the inhabitants, secure from the depredations the Indians, can farm and raise stock to great vantage.—*San Francisco Times.*

For "The Friend."

Spiritual Worship.

While evil abounds in the world and many are regarding the life of religion, it is essential to ep in the footsteps of the flock of Christ's com- nions, maintaining the spiritual worship of the spel, in reverent, silent waiting upon the Lord our religious meetings, and a deep indwelling th Him in our daily walks before the world, and r own households. If there is a body of Friends eserved in the life of Truth thus constantly exer- ed before the Most High, he will hear their ayers, and spread a solemnity over their assemblies at will be felt, and granting ability to exalt the andard of Truth, others will flow unto it. He can t into the hearts of all that serve Him, the same ve for his blessed cause, which he gave our fore- thers to feel. They counted not their lives dear nto them, in comparison with the preciousness of at cause which is unchangeable, however lightly teemed by the worldly wise, who are seeking to aw us from it.

That Friends were called to revive the worship the Gospel in its purity, is especially evident in eir release from all reliance upon a man-made inistry, and from the belief that public worship annot be performed without it, while other pro- ssing Christians adhere to this system, so that ithout a preacher prepared beforehand with a ser- on and a prayer, they consider that no worship an be performed by the congregation. Friends elieve it is their duty to assemble without any such rovision, and in silence, "seek the Lord, if haply hey might feel after Him and find Him, who is ot far from every one of us." Their faith is firm n the declaration of their Lord, that where two or hree, and of course hundreds, are met together in His name, he is in the midst of them; and as their inds are withdrawn from all outward objects, and entred upon God, He will make himself known to hem by the quickening power of His Spirit, and efresh them with the distillings of the heavenly iew. They will know Christ Jesus to be their teacher, who will administer reproof and instruction as they need, renew their faith and raise prayer and praise to the Fountain of all their mercies, and well-spring of eternal life to their souls. An assembly thus gathered, will experience a united harmonious labour for the bread and the water of life, and be brought to hold communion with their Lord in spirit, and to be a strength to one another to pursue their heavenly journey.

They could never have given themselves faith, so as to break from the yoke by which they were held in bondage to a hireling ministry, and a ceremonial worship, any more than professors of this day can leave their hired preaching, music, and singing, and adopt the simple gospel worship which is without money or price, and is performed in spirit and in truth, agreeable to the declaration of the Saviour himself; "The hour cometh and now is, when the true worshippers shall worship the Father in spirit and in truth; for the Father seeketh such to worship Him. God is a spirit, and they that worship Him must worship Him in spirit and in truth." Receiving power from on high to abandon all reliance upon man to enable them to perform this solemn duty, simply meeting together to wait upon the Lord for ability to offer acceptable adoration, and as he calls to the work of the ministry, to preach the gospel, and to offer vocal prayer in the name of Christ, all go to prove that it is the design of the Great Head of the Church, to make them instrumental to restore a pure ministry and worship, and to call the nations to the spiritual kingdom and government of Christ in the heart. The description given of the primitive believers by the apostle Peter, still applies to the true spiritual worshippers, when he says, "wherefore laying aside all malice, and all guile, and hypocrisies, and envies, and all evil speakings, as new born babes desire the sincere milk of the Word, that ye may grow thereby, if so be ye have tasted that the Lord is gracious. To whom coming as unto a living stone, disallowed indeed of men, but chosen of God, and precious, ye also, as lively stones, are built up a spiritual house, an holy priesthood, to offer up spiritual sacrifices, acceptable to God by Jesus Christ." "Ye are a chosen generation, a royal priesthood, an holy nation, a peculiar people; that ye should show forth the praises of Him who hath called you out of darkness into his marvellous light."

We have had seasons in which clouds have hid his face, and contrary winds to meet, against which faithful disciples have rowed hard to keep the ship from foundering, and to show forth his mercy extended to them. Had it not been for the supplies of faith he has given, and the tokens of his nearness to them, they would have fainted and given up the struggle. Many times they were told by the watchmen, that the darkest time was just before day, and they have hoped and longed for it to break forth. Their Captain has nevertheless not deserted them, but has helped them in every exigency, so that a plain, decided testimony for his blessed cause has been maintained from generation to generation, though hundreds have swerved from it, and laboured to turn away these disciples from being faithful to their Lord. But in the midst of suffering, they have, and will continue to have, a blessed reward, like an anchor to the soul, sure and steadfast. As they endure hardness and contempt, for and with their Lord, when he takes to himself his great power and reigns, they shall rejoice, and be made to reign with him.

Though he may seem to tarry long, let us wait patiently for him; he will surely come, he will not always tarry, but will deliver his Church and faithful ones, and triumph gloriously. The horse and his rider that have thought to trample down the suffering seed, who have stood firm for the ancient faith, will be thrown into the sea. Many, if they persist, will be scattered among the people of the the world, and lose their birthright to pure spiritual religion, that of the daily cross and self-denial, and the foolishness of the gospel, and having parted with it for a mess of worldly pottage, they will be unable to recover it. Let those who love the Truth keep steadfast to it, and seek for an increase of sincere fellowship and love towards one another, and the Lord will keep them. Generations will continue to be raised up, we may safely trust, to support the primitive doctrines of the Lord Jesus and his apostles, as they were afresh opened to George Fox, Robert Barclay, and their co-labourers, and many we believe will be again and again gathered, to raise the same standard of Christian purity and spiritual mindedness, as an ensign to the nations.

Extract from Prescott.

An Auto de Fe.

(Concluded from page 247.)

The whole number of convicts amounted to thirty, of whom sixteen were *reconciled*, and the remainder *relaxed* to the secular arm,—in other words, turned over to the civil magistrate for execution. There were few of those thus condemned, who, when brought to the stake, did not so far shrink from the dreadful doom that awaited them as to consent to purchase a commutation of it, by confession before they died; in which case they were strangled by the *garrote*, before their bodies were thrown into the flames.

Of the present number there were only two whose constancy triumphed to the last over the dread of suffering, and who refused to purchase any mitigation of it by a compromise with conscience. The names of these martyrs should be engraven on the record of history.

One of them was Don Carlos de Seso, a noble Florentine, who had stood high in the favour of Charles the Fifth. Being united with a lady of rank in Castile, he removed to that country, and took up his residence in Valladolid. He had become a convert to the Lutheran doctrines, which he first communicated to his own family, and afterwards showed equal zeal in propagating among the people of Valladolid and its neighbourhood. In short, there was no man to whose untiring and intrepid labours the cause of the Reformed religion in Spain was more indebted. He was, of course, a conspicuous mark for the Inquisition.

During the fifteen months in which he lay in its gloomy cells, cut off from human sympathy and support, his constancy remained unshaken. The night preceeding his execution, when his sentence had been announced to him, De Seso called for writing materials. It was thought he designed to propitiate his judges by a full confession of his errors. But the confession he made was of another kind. He insisted on the errors of the Romish Church, and avowed his unshaken trust in the Reformation. The document, covering two sheets of paper, is pronounced by the secretary of the Inquisition to be a composition equally remarkable for its energy and precision. When led before the royal gallery, on his way to the place of execution, De Seso pathetically exclaimed to Philip, "Is it thus that you allow your innocent subjects to be persecuted?" To which the king made the memorable reply, "If it were my own son, I would fetch the wood to burn him, were he such a wretch as thou art!" It was certainly a characteristic answer.

At the stake De Seso showed the same unshaken constancy, bearing his testimony to the truth of the great cause for which he gave up his life. As the flames crept slowly around him, he called the soldiers to heap up the fagots, that his agonies might be sooner ended; and his executioners, indignant at

the obstinancy—the heroism—of the martyr, were not slow in obeying his commands.

The companion and fellow-sufferer of De Seso was Domingo de Roxas, son of the Marquis de Roza, an unhappy noble, who had seen five of his family, including his eldest son, condemned to various humiliating penances by the Inquisition for their heretical opinions. This one was now to suffer death. De Roxas was a Dominican monk. It is singular that this order, from which the ministers of the Holy Office were particularly taken, furnished many proselytes to the Reformed religion. De Roxas, as was the usage with ecclesiastics, was allowed to retain his sacerdotal habit until his sentence had been read, when he was degraded from his ecclesiastical rank, his vestments were stripped off one after another, and the hideous dress of the *san benito* thrown over him, amid the shouts and derision of the populace. Thus appareled, he made an attempt to address the spectators around the scaffold; but no sooner did he begin to raise his voice against the errors and cruelties of Rome, than Philip indignantly commanded him to be gagged. The gag was a piece of cleft wood, which forcibly compressing the tongue, had the additional advantage of causing great pain while it silenced the offender. Even when he was bound to the stake, the gag, though contrary to custom, was suffered to remain in the mouth of De Roxas, as if his enemies dreaded the effects of an eloquence that triumphed over the anguish of death.

The place of execution—the *quemadero* the burning-place, as it was called—was a spot selected for the purpose without the walls of the city. Those who attended an *auto de fe* were not, therefore, necessarily, as is commonly imagined spectators of the tragic scene that concluded it. The great body of the people, and many of higher rank, no doubt, followed to the place of execution. On this occasion, there is reason to think, from the language —somewhat equivocal, it is true—of Philip's biographer, that the monarch chose to testify his devotion to the Inquisition by witnessing in person the appalling close of the drama; while his guards mingled with the menials of the Holy Office, and heaped up the fagots around their victims.

Such was the cruel exhibition which, under the garb of a religious festival, was thought the most fitting ceremonial for welcoming the Catholic monarch to his dominions! During the whole time of its duration in the public square, from six in morning till two in the afternoon, no symptom of impatience was exhibited by the spectators, and, as may well be believed, no sign of sympathy for the sufferers. It would be difficult to devise a better school for perverting the moral sense, and deadening the sensibilities of a nation.

For "The Friend."

Silent Meetings.

What is the reason some cannot enjoy silent meetings? Is it because they do not hold communion with their Maker? Those who do not thus commune, will seldom if ever enjoy a silent meeting. Those who live near to Him, do not look so much for outward preaching, as those who live further off, and as without Him in the world. Silent meetings, the world will never own. "How is it, that Thou wilt manifest thyself unto us, and not unto the world?" said one formerly. There are those of our religious Society who seldom attend meeting unless they expect some popular preacher there. Do their lives in other respects, speak that they are followers of the Lamb? Silence is one of the first and foremost lessons we have to learn, and to cease from our own righteousness, and seek that which comes from God only. I would not that any should be silent when they are rightly qualified to speak, but will any one ever be qualified to speak as the oracle of God, unless he or she holds silent communion with Him? If this be necessary for those who speak, it is also necessary for those who hear; that God may have all the glory. "But the comforter, which is the Holy Ghost, whom the Father will send in my name, he shall teach you all things, and bring all things to your remembrance whatsoever I have said unto you." Now does not this comforter teach us in silence? He may speak to us through an instrument, but would it not be wise in us to seek to have instruction from God himself, rather than to have it second hand.

Pa., Fourth mo., 1856.

For "The Friend."

I often hear from young people interested in society affairs, the expressions, "I cannot see it so." "I do not understand why," &c. To such I would say, let us *wait*. Nothing will be lost and much gained, if we wait for Him from whom sight and understanding cometh. Having acknowledged our blindness, let us wait for sight. Having confessed our ignorance let us wait for spiritual experience. Feeling our weakness let us wait for strength. Not for a little while only must we wait, but until the appointed time. We expect not babes to lift rocks, or remove mountains: strong men find it enough for them to do. "They that wait upon the Lord shall renew their strength." "Truly my soul waiteth upon God;" saith David, "from Him cometh my salvation;" and he found Him to be a "strong habitation whereunto he could continually resort."

If we are turning to him with *full purpose of heart*, we may feel an assurance that He will in his own good time *manifest Himself*, and we shall be enabled to go on from strength to strength, and one subject or doctrine after another will be opened to our understanding as we may be prepared to receive it. May we keep the door of our lips, fearing to do harm rather than hoping to do good, and remembering the words of the Son and sent of the Father, "By this shall all men know that ye are my disciples if ye have love one to another." F. H.

Extract.

Suffering—Inward Stillness.

May the deep sufferings of our Saviour be so dear to us, that we may never trample under foot the adorable Son of God, nor count the blood of the covenant unholy! May the faithfulness of the martyrs, when the prospect of death by fire was before them, be remembered—and may the patient, constant sufferings of the upright-hearted servants of God in latter ages be revived in our minds—and may we so follow on to know the Lord, that neither the faithful in this age, nor those in ages to come, may ever be brought under suffering, through our sliding back from the work of reformation in the world! While the active members in the visible church stand upright, and the affairs thereof are carried on under the leadings of the Holy Spirit, although disorders may arise among us, and cause many exercises to those who feel the care of the churches upon them, yet while these continue under the weight of the work, and *labour in the meekness of wisdom for the help of others*, the name of Christ in the visible gathered church may be kept sacred. But while they who are active in the affairs of this church, continue in a *manifest opposition to the purity of our principles*, this, as the prophet expresses it, is as when a standard bearer fainteth. And thus *the way opens to great and prevailing degeneracy*, and *to sufferings for such*, who through the power of divine love, are separated to the gospel of Christ, and cannot unite with anything which stan in opposition to the purity of it.

The necessity of an inward stillness hath und these exercises appeared clear to my mind. true silence strength is renewed; the mind herein weaned from all things, but as they may be enjoy in the divine will. Where the fruits of that spi which is of the world, are brought forth by ma who profess to be led by the spirit of Truth, a cloudiness is felt to be gathering over the visibl gathered church, the sincere in heart who abide true stillness, and are exercised therein before t Lord for his name's sake, have a knowledge of Chr in the fellowship of his sufferings, and inwa thankfulness is felt at times, that through divi love *our wisdom is cast out*, and *that forwa active part in us subjected*, which *would rise a do something* in the visible gathered church, *wit out the pure leadings of the spirit of Christ*.

While aught remains in us different from a perfe resignation of our wills, it is like a seal to a boo wherein is written that good and acceptable an perfect will of God concerning us; but when o minds entirely yield to Christ, that silence is know which follows the opening of the last of the seal In this silence we learn an abiding in the divi will, and there feel that *we have no cause to pr mote, but that only* in which the light of life direc us in our proceedings; and that the alone way t be useful in the church of Christ, is to abide faith fully under the leadings of his holy Spirit in a cases, and being thereby preserved in purity heart, and *holiness of conversation*, a testimony t the purity of his government may be held fort through us to others.—1772.

Seed-Time and Harvest.

For "The Friend."

Whilst observing the numerous and varie labours which have to be performed by the vigilar farmers, ere the fallow ground is prepared to receiv the seed or grain, and likewise the great and im portant changes through which the grain must pas before a harvest can be reaped, by those who hav bestowed the labour needful for increasing tha which is designed to sustain and nourish the morta part, my mind has been forcibly impressed, wit reflecting how much care we bestow to secure t ourselves the temporal blessings which are extende to us by the "giver of every good and perfect gift, for our proper use whilst sojourning in this uncer tain state of existence, and on the sorrowful neglec there is by a large proportion of the human family in faithfully endeavouring to work in the vineyar of the heart, and seeking to have its fallow ground prepared for the growth of the seed of the kingdom of heaven. If this were rightly done, the heavenly husbandmen would undoubtedly cause the plant o renown to take root there; and if through the ar of the holy spirit the heart is kept pure and free from weeds, and every thing which would obstruct it growth, he would in his own time cause it to spring up and bring forth fruit to his praise. He will water it by the showers of his love, prune it by his fatherly chas tisements, and finally when it is perfected and he sees meet, will gather it into his heavenly garner. Therefore may each individual earnestly strive to know this plant of the great creator's planting, to grow up, so that they may become fruit bearing branches and useful members of the church militant, prepared to partake of the pure joys of the church triumphant.

The reflection that this life or seed time is fleeting, and frequently of short duration, should cause each one to examine to what advantage they are employing the precious season. All should carefully employ their invaluable time and talents in a way that will redound most to the praise and glory

im who bestowed them, remembering that we
but stewards of the gifts entrusted to our care,
that we must render an account of our steward-
to the just and merciful judge, in the day of
account. Therefore let us be found faithful
he discharge of each manifested duty, giving
hatever is called for by him who is the all wise
cher of the heart, and when he condescends
isit any with his day spring from on high,
t not as between two opinions," but receive him
in, without waiting for a more "convenient
on."

aryland, Fourth mo., 1856.

Selected for "The Friend."

5th Mo. 20th, 1817.—O! How fervently, how
estly have my cries and breathings ascended to
, who is the fountain and source of all good,
all the true well-wishers of Zion's welfare, all
hearty, zealous, living labourers may be pre-
ed at this season,* on the right hand and on the
that they may be kept in their proper places,
in subjection to the great Master of our assem-
; that their spiritual eye and ear may be
ed and enlivened by his healing hand; that
r speech may be directed and their mouths fill-
n his own time and way to his glory! May each
of these be kept low under his almighty hand;
that which is of the creature within them be
ed, whilst that which comes from the source of
and glory, is exalted above every obstacle or
osition. O! Thou, who art pleased at times to
ur thy poor dependent little ones, those who
e no hope, or help, or happiness, but in the
e of thy benignant countenance; be pleased at
time so to refresh their hearts with the influence
by paternal presence, so to overshadow them
a sense of thy continued protection and care,
they may be severally encouraged and con-
ed to serve thee with greater diligence, to devote
nselves afresh to thy service and disposal, and
e sincerely and unreservedly to say *and to feel*,
thy will is best in all things!"—*J. Barclay.*

* Yearly Meeting.

Epistle of George Fox.

My dear Friends,—Keep in the faith of God
ve all outward things, and in his power, that
n given you dominion over all. The same power
God is still with you to deliver you as formerly;
God and his power is the same; his Seed is over
and before all; and will be, when that which
ses to suffer, is gone. Be of good faith, in that
ch changeth not; for whatsoever any do against
truth, it will come upon themselves; and fall as
illstone on their heads. If the Lord suffer you
e tried, let all be given up; and look at the
d and his power, which is over the whole world,
will remain when the world is gone. In the
d's power and truth rejoice over that which
ses to suffer, in the Seed, which was before it
; for the life, truth, and power of God, is over all.
keep in that; and if ye suffer in that, it is to
Lord. Friends, the Lord hath blessed you in
ward things; and now the Lord may try you,
ether your minds be in outward things, or with
Lord that gave you them. Therefore keep in
Seed, by which all outward things were made,
which is over them all. What! shall not I
y, and speak to God, with my face towards
avenly Jerusalem according to my wonted time.
t not any one's Delilah shave his head, lest he
his strength; neither rest in its lap, lest the
illistines be upon you. For your rest is in Christ
sus; therefore rest not in anything else."

G. F.

London, 12th of Second mo., 1670.

THE FRIEND.

FOURTH MONTH 19, 1856.

One of the most destructive fires that has occurred in our City for a long time, took place on the night of the 10th inst., beginning in the fifth story of an immense building situate at the head of Ranstead Court running west from Fourth street above Chesnut street and known as the Artizan Building. When the interior of this structure was destroyed, the walls fell in and the fire extended to several adjoining buildings, involving the one occupied as a printing office by Kite & Walton, which with its contents was burnt up. The proprietors were consequently deprived of type, presses, and their other materials for carrying on business; all of which had to be replaced, and a new location obtained for prosecuting their labours. As "The Friend" has been printed in their office, it required great exertion on the part of the proprietors to have the paper set up and struck off in time for the regular issue of the present number, and should any of our subscribers at a distance be disappointed by not receiving their paper as early as usual, they may attribute the delay to this circumstance. The printers have made arrangements for carrying on their business as usual.

On the evening of the 12th inst., the city of Philadelphia was visited by a tremendous storm of wind, which for a few minutes blew with the violence of a hurricane. There was a little rain, mingled with hail, and accompanied by vivid flashes of lightning. During the day, a southerly wind had prevailed, and the thermometer had risen several degrees above summer heat, producing feelings of exhaustion and great languor. After the sun set, heavy piles of clouds gathered in the west, appearing to promise copious showers; but about 10 o'clock P. M., the wind shifted to the north-west, and suddenly came roaring through the streets with a violence truly frightful. Within the city limits, about one hundred and fifty houses were more or less damaged, some completely demolished, some unroofed, and others with chimneys thrown down, and windows beat in. In many places it is evident the hurricane acted by a gyratory motion, twisting off the trunks of trees of many inches in diameter, and scattering beams, boards and fences in every direction. Although in several instances the roofs of houses of considerable altitude were precipitated on to more humble dwellings, crushing them in; and in others, large stacks of chimneys were toppled over, breaking through roofs and floors, and covering the inmates with fragments, yet in no case so far as we have heard, has there been any loss of human life, a renewed cause for gratitude to the great Preserver of men.

From the accounts that have reached us from various parts of the country, it appears that the extent of the tornado was great, and the pecuniary loss immense.

A MOVEABLE PLANISPHERE.

We have had one of the above named instruments shown to us by the inventor. By a simple adjustment of its component parts it shows at one view the stars rising, setting, or on the meridian, as well as the position of those that never set, visible in the U. States, for every five minutes in every day or hour: also the sun's place among the stars for every day. The directions for using the Planisphere appear simple and easily understood, and we should suppose its use would speedily render familiar the position and movements of the different constellations. It is an invention of Henry Whitall, and can be obtained at No. 32 South 3rd Street, or at No. 50 North 4th street.

SUMMARY OF EVENTS.

EUROPE.—News from London to the 25th ult. The Protocol of peace had not been signed at Paris, and it was reported that the Conference was less harmonious since the Prussian Plenipotentiaries had been admitted. Peace was however regarded as substantially certain. The British government had despatched two steam frigates in search of the Pacific, of which no tidings had reached England. The Copenhagen correspondent of the London Times states that the Danish Commissary had submitted to the Copenhagen Conference the proposal for the capitalization of the Sound Dues, fixing the sum of 35,000,000 rix dollars as the minimum of the indemnity which Denmark claimed. The writer states further that the United States having declined taking any part in the Conference, the question would in all probability be resolved without their co-operation. James Buchanan, designed leaving Southampton on the 9th inst. in the steamer Arago for New York.

The War.—All the Russian Baltic ports are declared to be still under blockade. The Allies had commenced the demolition of the enclosure and lines around Sebastopol. The French army was suffering greatly from scurvy and fever. The daily mortality in their ranks, amounted to 120 and upwards. The Russian army in Asia Minor under General Mourarieff had received reinforcements by way of the Caspian Sea.—Advices from Nicolaieff state that a Commission had arrived there from St. Petersburg on the 4th of March, and immediately commenced operations for the abandonment of that place as a military depot. It was stated that it would be a free port.—Advices from Persia state that Dost Mohammed had taken possession of Candahar, and that Persian troops were marching against him.—The city of Parma, Italy, has been again laid under siege, owing to the frequent disturbances and assasinations taking place there.

Liverpool Markets.—Cotton was unchanged. Bread stuffs were dull, with a decline of 1*s.* to 1*s.* 6*d.* in Flour. Consols 92⅞.

Four days later.—The Peace Congress.—It is announced that all the difficulties have been surmounted, and that a treaty of peace will be signed in a few days.

UNITED STATES.—The Senate having called for more information on Kansas affairs, and the House for further intelligence on the Central American question, the President by message has informed Congress that there is nothing new in the State Department on these subjects, Kansas and the Slavery question have been the prominent subjects of debate in both Houses. On the 10th inst., Howard and Sherman members of the Kansas Committee were at St. Louis on their way to the Territory.

Boston.—On the 12th inst., the Gerrish Market Building and other property was destroyed by fire, involving a loss of about $200,000.

Galena, Ill.—On the 1st a very destructive fire broke out in Galena which destroyed many houses and much property. The loss is stated at $300,000.

The Indians.—The latest news from the plains states, that Col. Harney had met the representatives of all the Indian tribes in the Sioux country, excepting two, and that definite terms of peace had been agreed upon.

New York.—Mortality last week 433; 158 adults and 275 children. The imigration at this port for the first quarter of the present year numbered 9,152 persons, in the corresponding portion of 1855 the number was 15,677, and the year previous 23,714. The U. S. mail steamship Adriatic for the Collin's line has been launched. This is the largest and is intended to be the finest of the line. The entries at the custom house of foreign goods imported during the third Month make a total of $20,145,613. The export of domestic produce for the month amounted to $8,044,122.

Philadelphia.—Mortality last week, 95 adults and 123 children—total, 218. On the 11th inst., a large edifice in Ranstead Place, known as the Artizan Building, was entirely destroyed by fire. This, and several buildings adjoining, which were also consumed, were occupied principally by printers, lithographers, and other artizans, who are heavy losers by the conflagration, very little property of any kind having been saved. The total loss is estimated at $363,000. The number of persons employed in the various buildings destroyed was about 420. About ten o'clock on the evening of the 12th inst., a hurricane swept over the city, causing considerable destruction of property.

It commenced with a fierce roaring of the wind, preceded by a few flashes of lightning and followed by a fall of hail. It lasted only from ten to fifteen minutes, and its fury was greatest in the northern portion of the city, but in all parts traces of its violence were left. Many houses were unroofed, and a considerable number blown down. Some persons were injured, but no lives were lost.

Cleveland, Ohio.—This city and its vicinity was visited by a terrific storm on the night of the 12th inst., which demolished many buildings, and caused great destruction of property.

Miscellaneous.—*The Slave Schooner Falmouth.*—The U. S. District Court, New York, has ordered the Schooner Falmouth and her cargo to be sold as a prize to the Government, for being engaged in the Slave trade.

Colonization.—The American Colonization Society has issued an appeal relative to more than one hundred slaves, to whom emancipation is offered, if the friends, of freedom and of colonization will afford them a passage to, and comfortable settlement in Liberia.

Contempt of Court.—A bill has been reported in Congress, granting a jury trial in every case of contempt of court, the fine to be a stated amount, and the imprisonment for a limited period.

Exploration of Western Africa.—The American Geographical and Statistical Society has determined to send an expedition to explore the broad central belt of the African continent, particularly the country lying east of the republic of Liberia, along the coast of the river St. Paul, and thence southward to the coast of Guinea.

The Late Winter.—A week since, snow drifts remained on level land near Montreal, twenty-three feet deep. The loss of cattle in Texas in consequence of the extreme cold has been very great. In many counties not less than one-third of the stock had died.

The Lead Trade of Galena.—The shipments of lead from Galena, in 1855, amounted to 30,125,550 pounds, valued at $1,752,219. The shipments from this point were at the highest in 1845, when 54,494,850 pounds were exported.

Famine at Cape de Verds.—At the latest accounts from these islands, the inhabitants were reduced to the last extremity for food, and actual starvation had occurred in a number of instances.

The East India Trade of the United States, including the African and Pacific trade, employs at the present time 400 ships and 150 barks, the greater proportion of which are owned in Boston and New York. Fifty years ago a few 200 ton ships and brigs controlled the East India business.

The Agricultural Department of the Patent-office, at Washington, which has done so much good in introducing plants and seeds from abroad, and distributing them in this country for cultivation, proposes now to extend its operation so as to obtain from abroad every plant, herb or tree, which has been cultivated successfully anywhere.

FALLS MONTHLY MEETING SCHOOL.

The Committee of the above named School is desirous to procure a well qualified female teacher, to take charge of the School as instructor, for the ensuing season. Early application is requested, and can be made by addressing, John B. Balderston, Fallsington, Bucks County, Pa.

A copy of "THE FRIEND," from volumes 1 to 19 inclusive, can be had at a reduced price, by applying at the office of publication.

FRIENDS' HORSES.

Friends coming to this city to attend Yearly Meeting, or at other times, on the service of Society, who put up within the limits of the Monthly Meeting of Friends of Philadelphia for the Northern District, can have their horses accommodated at the stables of William A. Scheetz, (Montgomery Hotel,) North-east corner of Sixth and Willow streets.

Philad., Fourth mo. 10th, 1856.

BIBLE ASSOCIATION OF FRIENDS IN AMERICA.

A Stated Annual Meeting of the Bible Association of Friends in America, will be held at the Committee-room, Arch street Meeting-house, on Seventh-day evening, Fourth month 19th, 1856, at 8 o'clock. Friends generally, of both sexes, are invited to attend.

JOHN CARTER, Sec'y.

HAVERFORD SCHOOL ASSOCIATION.

The Stated Annual Meeting of the Haverford School Association, will be held at Committee-room, Arch street Meeting-house, on Second-day afternoon, at 4 o'clock, Fifth month 12th, 1856.

CHARLES ELLIS, Sec'y.

FRIENDS' BOARDING-SCHOOL FOR CHILDREN, AT TUNESSASSAH.

A man Friend is wanted to aid in carrying out the concern for the improvement to the Indians.

Application may be made to JOSEPH ELKINTON,
377 S. Second street.
THOMAS EVANS,
180 Arch street.

Philad., Eleventh mo. 1st, 1855.

MARRIED, on Fifth-day, 10th instant, at Friends' Meeting-house, Germantown, Philadelphia, SAMUEL MASON, of this city, to JANE EDGE, daughter of Thomas Edge, late of East Caln township, Chester county, Pa.

DIED, at Newport, R. I., on Sixth day, the 22nd of Second month last, after an illness of about three weeks, THOMAS B. GOULD, an approved minister of Rhode Island Monthly Meeting, (smaller body,) in the 43rd year of his age. This beloved Friend early yielded to the Cross of Christ, giving up the morning of his day to the cause and service of Truth; in the defence of which he was called to stand. Much might be said of his fidelity thereto, and his labours therein, but this sketch is merely intended to give some account of the expressions which fell from his lips during his last sickness; showing that a life early devoted, has, through continued dedication and reliance upon the divine arm, been crowned with a triumphant close. During the first week of his illness he appeared to be mostly engaged in meditation, without much expression; but one morning about the beginning of the second week, he broke forth. "Oh!" he exclaimed, "the fullness of joy,—the abundance of goodness,—the sweet peace that I feel,—I could sing of it—yet nothing is of myself it is all in mercy! all that I could do was to cast myself at Jesus' feet; and in his own time, when he saw I had nothing of my own, He was pleased to pour in the oil and the wine." "He marvelled that such an experience should have been given him. He had never asked more than the lowest seat—and lo! he had been permitted to see a mansion prepared for him!" At another time, he said, his sufferings were intended to bring him low, and purify him; but he added, "the Lord supports me, and he will support me." On the ninth day of his sickness, for several hours he appeared to be near his close; in the evening, however, he revived, but had very low sinking turns, during the night; after the last, he said, "now I have triumphed—Christ has given me the victory." A brother-in-law coming to see him, he said on his entering the room, "Although my earthly house of this tabernacle be dissolved, I have a building of God, an house not made with hands, eternal in the heavens."—Again, "my weaknesses and propensities have been as a cloud, and as a thick cloud they have been blotted out—my sins have all been forgiven." A friend calling to see him, he spoke of his very low state, but said he had been wonderfully comforted and helped; then alluding to a time a little before his sickness, he remarked, "I looked all night for my beloved, I sought for him in the streets, but I could not find him. He hid himself from me; but He has comforted and strengthened me now;—Great and marvellous are thy works, Lord God Almighty! just and true are all thy ways thou King of saints." His friends desired him not to exert himself so much to speak—but he replied, "When the Master is pleased to say it is enough, I can be silent, but not till then," adding, "this is very different from anything I anticipated, to have so much to say at such a time as this. There are times when words must be spoken, and if they are not, the very stones would cry out." On Fifth day evening the 14th, after laying sometime in a state of great exhaustion, he revived, and exclaimed in a clear voice, "Glory, glory, hallelujah! Oh! I could sing of redemption, of this great redemption—at regeneration, heartfelt regeneration!" and conti speaking in this strain for about half an hour, which time, he repeated with great emphasis, "O Zion, the perfection of beauty, God hath shined." one time he said, he had suffered persecution Christ's sake, and he rejoiced that he had been cou worthy to suffer persecution. He was remark relieved of anxiety in regard to the state of the Soc When he spoke of its shattered condition, he w say, "but we must leave it in the hands of the L for He *will* have the ordering of the battle," repea it many times over, and added, "there is no cause discouragement." On Second day, the 18th of month he had a suffering night, and said more once, in a whisper, (for his articulation was diffic "How long dear Saviour, how long? On fourth previous to the close, when enquired of, if he felt poorly, he replied, "my thoughts are full of immo ity and eternal life." The day of his close, he much that could not be understood, but several t repeated the passage, "That which may be know God is manifest in man." Towards evening his perceiving a change in him, said, "dearest Thomas thou going." After one ineffectual attempt to sp he said, "Farewell—farewell," which was the last uttered. The agonies of death appeared to have passed through, and he now ceased to breathe—th was no struggle—all was quiet and peaceful. foregoing account contains but a small portion of he uttered during his sickness, similar in characte the above. Enough, however, is preserved to give undoubted assurance that having fought the good fi finished his course and kept the faith; he has receiv the crown which the Lord, the righteous judge, giv to all those who love his appearing.

——, on the 13th of Third month, 1856, in the 4 year of her age, UNITY, wife of Thomas Hobson Washington County, Ohio, a useful and much esteem member of Plymouth Monthly, and Particular M ing. This dear friend manifested a steadfast atta ment to the ancient doctrines and testimonies of religious society, and endeavoured to walk answera thereto, being a good example in her neighbourho and a diligent attender of our religious meetings. health had been for several months declining, duri which time she passed through much exercise of mi appearing earnestly concerned that her day's wo might be done in the day time, and during the last days of her illness, she several times expressed t she felt nothing in her way, so that her sorrowi friends feel the consoling hope that her end was pea

——, on the 14th of Third month, SUSANNA WILL a member of Western District Monthly Meeting, the 86th year of her age. During a period of ma years of confinement and suffering, this dear Frie was an instructive example of patience and resignatio and her friends have the consolation to believe th her end was peace.

——, at his residence in Bucks County, Pa., on t 22nd of Third month, DR. DAVID FELL, in the 82 year of his age, a member of Buckingham Particul and Monthly Meeting. He was unable for sever years, owing to physical infirmities, to attend meeting but was warmly attached to the doctrines of our socie in their primitive simplicity and purity. He loved t Truth and enjoyed hearing the writings of our ear Friends read to him, being unable to peruse them hi self. During the last two months of his life, his su ferings were, at times intense, but he bore them wi christian patience and resignation. To his wife he sai "I endeavoured to make my peace in the early part my sickness." A few days before his decease, aft passing a night of great suffering, one standing b remarked, "There is a land of rest," to which he r plied, "It is an awful thing to die. Were it not for th mercies of Jesus Christ, I know not what would becom of the world." He shortly after expressed his belief would be an awful thing in the dying hour for thos who had denied their Saviour. A short time before he ceased to articulate, he intimated he had a hop "all was well" with him, and his peaceful close h left the consoling belief he has been gathered as a shoc of corn fully ripe.

——, at his residence in Levin County, Iowa, on th 2nd of Fourth month, 1856, EXUM BUNDY, in the 50t year of his age, a member of Red Cedar and Linn Par ticular Meeting. He said, near his close, that hi peace was made; there was now nothing in his way.

THE FRIEND.

Postage to any part of Pennsylvania, for three months if paid in advance, three and a quarter cents; to any part of the United States, for three months, if paid in advance, six and a-half cents.

From the Quarterly Review.

Zoological Sketches.

(Continued from page 250.)

Let us now cross over from the cages of the king of beasts to the aviary of the king of birds. The collection of eagles, vultures, and condors, numbers upwards of twenty species, among which we recognized "the oldest inhabitant" of the Gardens,—the vulture, presented to the Society by —— Brooks, Esq. surgeon, more than twenty-five years ago. Notwithstanding his age, he looks one of the finest birds in the collection. We question, however, if the last new comer of the same species will not "put his bill to it," arriving as it does from a distant shore to which thousands of anxious hearts are turned. We allude to the vulture lately sent from the Crimea. It was caught near the monastery of Saint George, and the proximity of his retreat to many a battle-field suggests reflections too painful to dwell upon. The prominent impression produced in glancing at this aviary is the perfect isolation which each bird maintains as he crowns the topmost pinnacle of the clap of rocks reared in the centre of his den, where he perches motionless as a stone. There seems to be no recognition of his fellow-prisoners—no interchange of either blows or courtesies between the bars netting. Each seems an enduring captive that will not be comforted or won over to the ways of men. Now and then unsheathing his piercing eye, as perceive the huge wings spread, and perchance remembering the callow eaglets in some Alpine eyrie, the bird soars upwards for a moment, beats his pinions against the netting, and falls to earth again with the ignominious flop of a Christmas turkey. It is impossible to contemplate these birds without pity not unmixed with pain. Who can recognise, in the motionless bunch of feathers before us, Audubon's magnificent description of the Bald Eagle as he swoops upon his prey:

"The next moment the wild trumpet-like sound of a yet distant but approaching swan is heard. . . . Now is the moment to witness a display of the eagle's powers. He glides through the air like a falling star, and, like a flash of lightning, comes upon the timorous quarry, which now, in agony and despair, seeks, by various manœuvres, to elude the grasp of his cruel talons. It mounts, doubles, and fearlessly would plunge into the stream were it not prevented by the eagle, which, long possessed of the knowledge that by such a stratagem the swan might escape him, forces it to remain in the air by attempting to strike it with its talons from beneath. The hope of escape is soon given up by the swan. It has already become much weakened, and its strength fails at the sight of the courage and swiftness of its antagonist. Its last gasp is about to escape, when the ferocious eagle strikes with his talons the under side of his wing, and with unresisted power forces the bird to fall in a slanting direction upon the nearest shore."

This is the romance of the noble bird's mode of obtaining food—here, as he marches off with a dead rat in his claw, or a piece of raw beef, we behold its prose. But however unpoetical this treatment, it cannot be said to disagree with him, as fine plumage and good condition prove. Passing on our way to the monkey-house, the merry otters are seen playing "follow-my-leader" round their rock-house, now plunging headlong in search of the flat-fish which shine at the bottom of the water—now bringing it to shore, and crushing flesh, vertebræ, and all.

The admirably arranged but vilely ventilated monkey-house is always a great source of attraction. The mixture of fun and solemnity, the odd attitudes and tricks, and the human expression of their countenances, all tend to attract, and at the same time to repel. Mr. Rogers used to say, that visiting them was like going to see one's poor relations, and wondrous shabby old fellows some of them appear. We have only to look into their faces for a moment to see that they differ from each other as much as the faces of mankind. There is a large, long-haired, black-faced rascal, who looks as murderous as a Malay; a little way off we see another with great bushy whiskers and shaggy eyebrows (the mona,) the very picture of a successful horse-dealer; a third, with his long nose and keen eye, has all the air of a crafty old lawyer. The contemplation of them brings involuntarily to the mind the doctrine of the transmigration of souls. The apes and baboons are indeed purely brutal, and only excite disgust: towards the latter the whole company of smaller monkeys express the utmost hatred—as may be seen when the keeper by way of fun takes one of them out of his cage and walks him down the room. The whole population rush to the front of their cages, and hoot, growl, and chatter at him, as only Eastern County shareholders can do when their chairman takes his seat. The vivacious little capuchin monkeys are evidently the favourites and bag most of the nuts; the brown capuchin appears to be particularly knowing, as he keeps a big pebble at hand, and, when he finds that his teeth are not equal to the task, he taps the nut with the stone with just sufficient force to break the shell without bruising the kernel. We have often seen this little fellow take a pinch of snuff, and assiduously rub his own and companion's skin with it, with a full knowledge, no doubt, of the old recipe for killing fleas. He will also make use of an onion for a similar purpose. Among the other quadrumana in this house, we find the lemurs, which look more like long-legged weasels than monkeys, and the bright-faced little marmosets, who cluster inquiringly to the front of their cage, looking in their cap-shaped head-dress of fur like so many gossips quizzing you over the window-blinds.

At the present moment there is no specimen of either the uran or chimpanzee in the Gardens, but there have been at least half-a-dozen located here within the last ten years, one of which, "Jenny," maintained her health for five years. The damp cold air of the Gardens at last brought on consumption, and the public must remember the poor, wheezing, dying brute, with a plaster on her chest and blankets around her, the very picture of a moribund old man. The only specimen now in Europe is in the Jardin des Plantes at Paris. This animal, one of the finest ever seen, is in excellent health, and promises to maintain it in the bright air of la Belle France. An accomplished naturalist has kindly furnished us with the following particulars of this brute, which clearly indicate that he is a very Doctor Busby among his fellows:

"He passed through London on his way to Paris, having landed at Plymouth. There were then two female Chims resident in the Gardens in the Regent's Park, and the French Chim was allowed to lodge in their hotel for a couple of nights. On his appearance both of these young ladies uttered cries of recognition, which however evinced more fear than anything else. Chim was put into a separate compartment, or room with a double grille, to prevent the probable injuries which discordant apes will inflict on each other. He had scarcely felt the floor under his feet when he began to pay attention to his countrywomen thus suddenly and unexpectedly found. Their fear and surprise gradually subsided, and they stood watching him attentively, when he broke out into a characteristic *pas seul*, which he kept up for a considerable time, uttering cries scarcely more hideous than seem the notes of a Chinese singer, and not far out of unison with his loudly-beating feet. The owner, who was present, said that he was imitating a dance of the negroes which the animal had often seen while resident in his house in Africa. The animal was upwards of a year and a half old, and had spent one year of his life in this gentleman's house. The Chim maidens gradually relaxed their reserve as the vivacity of the dance increased, until at last, when it was over, each stealthily put a hand through the grille and welcomed their friend and brother to their home in a far land. As the weather was severe—it was early in December—it is possible that their talk was of their native palm-groves and their never-ending summer. Chim thenceforth made himself as agreeable as possible, and when the time for his departure came, the maidens exhibited the livelist regret, short of tears, at losing him. At Paris he increased rapidly in stature and intelligence. The climate, diet (he drinks his pint of Bordeaux daily,) and lively society of the French seem to be more congenial to Chim's physique than our melancholy London. He makes acquaintance not only with the staff but with the habitues of the Garden. The last time I saw him (May, 1854) he came out to taste the morning air in the large circular enclosure in front of the Palais des Singes, which was built for 'our poor relations' by M. Thiers. Her Chim began his day by a leisurely promenade, casting pleased and thankful glances towards the sun, the beautiful sun of early summer. He had three satellites, coati-mundis, either by chance or to amuse him, and while making all manner of eyes at a young lady who supplies the Singerie with pastry and cakes, one of the coati-mundis came up stealthily behind and dealt him a

small but malicious bite. Chim looked round with astonishment at this audacious outrage on his person, put his hand haughtily upon the wound, but without losing his temper in the least. He walked deliberately to the other side of the circle, and fetched a cane which he had dropped there in his promenade. He returned with majestic wrath upon his brow, mingled, I thought, with contempt: and, taking Coati by the tail, commenced punishment with his cane, administering such blows as his victim could bear without permanent injury, and applied with equal justice to the ribs on either side, in a direction always parellel to the spine. When he thought enough had been done, he disposed of Coati without moving a muscle of his countenance, by a left-handed jerk which threw the delinquent high in air, head over heels. He came down a sadder and a better Coati, and retired with shame and fear to an outer corner. Having executed this act of justice, Chim betook himself to a tree. A large baboon, who had in the mean time made his appearance in the circle, thought this was a good opportunity of doing a civil thing, and accordingly mounted the tree and sat down smilingly, as baboons smile, upon the next fork. Chim slowly turned his head at this attempt at familiarity, measured the distance, raised his hind foot, and, as composedly as he had caned the Coati, kicked the big baboon off his perch into the arena below. This abasement seemed to do the baboon good, for he also retired like the Coati, and took up his station on the other side. To what perfection of manners and development of thought the last year and a half may have brought him, I can scarcely guess; but one day doubtless some one will say of him, as an Oriental prince once said to me, after long looking at the uran 'Peter,'—'Does he speak English yet?'"

(To be continued.)

Epistle of George Fox to Elizabeth, Princess of the Rhine.

Princess Elizabeth,—I have heard of thy tenderness towards the Lord and his holy truth, by some Friends that have visited thee, and also by some of thy letters, which I have seen; it is indeed a great thing for a person of thy quality to have such a tender mind after the Lord and his precious truth; seeing so many are swallowed up with voluptuousness, and the pleasures of this world, yet all make an outward profession of God and Christ one way or another, but without any deep inward sense and feeling of him. For it is not many mighty, nor wise of the world, that can become fools for Christ's sake, or can become low in the humility of Christ Jesus, from their mighty state, through which they might receive a mightier estate and a mightier kingdom, through the inward Holy Spirit—the divine light and power of God, and a mightier wisdom which is from above, pure and peaceable. This wisdom is above that which is below; that is earthly, sensual, and devilish, by which men destroy one another, yea, about their religious ways, worship, and churches; but this they have not from God nor Christ. The wisdom which is from above, by which all things were made and created, which the holy fear of God in the heart is the beginning of, keeps the heart clean, and by this wisdom are all God's children to be ordered, and with it to order all things to God's glory. This is the wisdom that is justified of her children. In this fear of God, and this wisdom my desire is, that thou mayst be preserved to God's glory. For the Lord is come to teach his people himself, and to set up his ensign, that the nations may flow into it. There hath been an apostacy since the apostles' days, from the divine light of Christ, which should have given them "the light of the knowledge of the Glory of God, in the face of Christ Jesus;" and from the Holy Spirit, which would have led them into all truth; and therefore have people set up so many leaders without them, to give them knowledge; and also from the holy and precious faith, which Jesus Christ is the author and finisher of; which purifies the heart, and gives victory over that which separates from God; through which faith they have access to God, and in which they please God; the mystery of which is held in a pure conscience; and also, from the gospel which was preached in the apostles' days, (which gospel is the power of God,) which brings life and immortality to light in man and woman, by which people should have seen over the devil that has darkened them; which gospel will preserve all them that receive it, in life and immortality. For the eyes of people have been after men and not after the Lord, who writes his law in the hearts and puts it into the minds, of all the children of the new covenant of light, life, and grace, through which they all come to know the Lord, from the least to the greatest; so that the knowledge of the Lord may cover the earth, as the waters do the sea. This work of the Lord is beginning again, as it was in the apostles' days; people shall come to receive an unction in them again from the Holy One, by which they shall know all things, and shall not need any man to teach them, but as the anointing doth teach them; and also to know, what the righteousness of faith speaks, the Word nigh in the heart and mouth, to obey it and to do it. This was the Word of faith the apostles preached, which is now received and preached again, and which it is the duty of all true christians to receive. So now people are coming out of the apostacy to the light of Christ and his Spirit, and to receive faith from him, and not from men; to receive the gospel from him, their unction from him, the Word; and as they receive him, they declare him freely, as his command was to his disciples, and is still to the learners and receivers of him. For the Lord God in his Son Jesus Christ, is come to teach his people, and to bring them from all the world's ways, to Christ, the way, the truth, and the life, who is the way to the Father; and from all the world's teachers and speakers, to him the Speaker and Teacher, as Heb. i. 1; and from all the world's worshippers, to worship God in the Spirit and in the Truth, which worship Christ set up above sixteen hundred years ago, when he put down the Jews' worship at the temple at Jerusalem, and the worship at the mountain where Jacob's well was; to bring people from all the world's religions, which they have made since the apostles' days, to the religion that was set up by Christ and his apostles, which is pure and undefiled before God, and keeps from the spots of the world; to bring them out of all the world's churches and fellowships, made and set up since the apostles' days, to the church that is in God, the Father of our Lord Jesus Christ, Thess. i. 1; and to bring to the unity and fellowship in the Holy Spirit that doth mortify, circumcise, and baptize, to plunge down sin and corruption, that has got up in man and woman by transgression. In this Holy Spirit, there is a holy fellowship and unity; yea, it is the bond of the Prince of princes, and King of kings, and Lord of lords' peace; which heavenly peace all true christians are to maintain with spiritual weapons, not with carnal. And now my friend, the holy men of God wrote the Scriptures, as they were moved by the Holy Ghost; and all christendom are on heaps about those Scriptures, because they are not led by the same Holy Ghost as those were that gave forth the Scriptures; which Holy Ghost they must come to in themselves, and be led by, if they come into all the truth of them, and to have the comfort of God, of Christ, and of th
For none can call Jesus, Lord, but by the H
Ghost; and all that call Christ, Lord, without
Holy Ghost, take his name in vain. Likewise
that name his name are to depart from iniqui
then they name his name with reverence, in tr
and righteousness. O, therefore, feel the gr
and truth in thy heart, that is come by Jesus Ch
that will teach thee how to live, and what to de
It will establish thy heart, season thy words,
bring thy salvation; it will be a teacher unto
at all times. By it thou mayst receive Christ
whom it comes; and as many as receive him,
them he gives power, not only to stand against
and evil, but to become the sons of God; if so
then heirs of a life, a world, and kingdom wi
out end, and of the eternal riches and treasu
thereof. So, in haste, with my love in the L
Jesus Christ, who tasted death for every m
and bruises the serpent's head, who is between m
and God, that through Christ man may come to G
again, and praise him through Jesus Christ,
amen; who is the spiritual and heavenly rock a
foundation for all God's people to build upon, to
praise and glory of God, who is over all, bles
forevermore. GEORGE FOX.

Amsterdam, the 7th of the Sixth mo., 1677.

Postscript.—The bearer hereof is a daughter-law of mine, that comes with Gertrude Dir
Nieson, and George Keith's wife, to visit thee.

G. F.

The Princess Elizabeth's answer.

Dear Friend,—I cannot but have a tender l
to those that love the Lord Jesus Christ, and
whom it is given not only to believe in him
also to suffer for him; therefore, your letter a
your friends' visit have been both very welcome
me. I shall follow their and your counsel as
as God will afford me light and unction; rema
ing still your loving friend, ELIZABETH.

Hertford, the 30th of August, 1677.

From "The United States Magazine of Science, Art, &c.

Transportation of Passengers and Wares.

(Continued from page 251.)

Although the suggestion of steam as a moti
power is claimed for several parties, undoubtec
the first practical idea of applying steam power
wheeled carriages is due to Dr. Robinson, by wh
it was communicated to Watt, in 1759. So
time afterward, the latter made a model of a hig
pressure locomotive, and described its principles
his fourth patent, in 1784, which, among certa
improvements, specified "a portable steam engi
and machinery for moving wheeled carriages." W
however, had doubts of the safety of his machi
and mentioned the subject to one of his frien
Murdoch, who, three years af reward, construct
the model of a locomotive which proved the corre
ness of the previous calculatiotns. "This engin
we are told, "was made in 1787, and persons
still alive who saw it in that year, drive a sm
wagon round a room at his house at Redruth,
Cornwall." Among those who saw it, was Richa
Trevithick, who, in 1802, took out a patent fo
similar invention.

Singularly enough, a similar model was exhib
ing, the same year, at the opposite end of the kin
dom. Symington's locomotive was then shown
the house of Mr. Gilbert Measom, at Edinbur
He pursued the experiment, and, in 1795, work
a steam-engine on a line of turnpike road,
Lanarkshire and the adjoining county. Then f
lowed that by Trevithick and Vivian, in 18
which ran on the Merthyr tram-way, and drew

ad of ten tons at the rate of five miles per hour. ight ridges were left in the edge of the wheels and the trams, to prevent their slipping round, and insure a forward movement. That, without this recaution, there could be adhesion or advance, as an idea that long prevailed. The cause of this pping lay in the construction of the engine, which ad but one cylinder, and the crank having to pass o centres during one revolution of the wheel; the nsequence was an occasional slow dragging motion. revithick, who was a man of great ability, and e to whom steam locomotion is much indebted, terward made a carriage to run on common roads, hich combined several arrangements now in use. he fire-place was surrounded by water, and the aste steam blown off through the smoke-pipe, to oduce a draught. The cylinder was placed side the boiler, for economy of heat, and the fore- heels made to turn with cranks in connection with e piston-rod; but with one cylinder only, the mo- on was very irregular. This engine was exhibit- d on one of the roads in Lambeth, in 1806, with- ut, however, exciting more than a temporary in- rest. Three years previously, another locomotive y Trevithick had blown up—an accident which eated so much dread of high-pressure steam-car- ages, that a feeling of alarm arose respecting their e, which, in some quarters, was long in being dis- elled.

Blenkinsop, of Middletown Colliery, near Leeds, nstructed a locomotive in 1811, the wheels of hich were cogged and ran in toothed rails; a isy contrivance, intended to overcome the imagi- ary difficulty—want of bite—and effectually pre- nted rapid motion by its enormous friction. The gine had two cylinders, and so far was an improve- ent on those which preceded it, and laboured ong at five miles an hour. The Chapmans' came xt with a new plan, a chain stretched from one d to the other, along the middle of a tram-way, as passed once around a wheel fixed beneath the rriage, and this wheel being made to revolve by e action of the machinery, its bite on the chain used the whole to move forward. This method volved so great an amount of friction, that it was andoned almost as soon as tried. Brunton fol- wed, in 1813, with mechanical legs and feet at- ched to the rear of his engine, intending by the ternate walking motion, to propel it continually rward, and prevent the slipping of the wheels on e rails. Considerable ingenuity was displayed in is contrivance, which performed well, and in cer- in cases might be employed with advantage, but was not well adapted to locomotive propulsion. he difficulty against which it was especially ap- ied, was soon proved to have no existence.

During the same year, Blackett repeated Trevi- ick's experiments at Wylam, in Northumberland, nd the fact was satisfactorily demonstrated that, ordinary circumstances, and with clean rails, e adhesion between the wheel and the rail was fficient to cause a progressive motion. It would ve been proved long before had the engine am-plates been heavier: both were too light; and e slipping so much complained of had been an ccidental, not a necessary consequence. Meantime, tephenson was busy at Killingworth, in another art of Northumberland, making and testing loco- otives. In 1814, he verified the experiments of her inventors, and went beyond them all in the erfection and performance of his machinery. He ook out patents in the two following years for ngines, that with a load of twenty tons, and on nooth rails, would travel five miles an hour, and n miles without a load. No better result at that me was looked for. The possibility of transport- g heavy goods with facility at a slow pace having been demonstrated, all that remained was to make it available.

Early in 1829, before the completion of the Liverpool and Manchester railroad, the company sent a deputation to Killingworth, to witness the workings of the locomotives, with the view to the employment of a similar power on their line when put in operation. Although the rails were not laid with that precision now considered so indispensable, the deputation found that the locomotives had been kept at work with much regularity, drawing heavily-laden trains of wagons from the coal-pits to the ships in the Tyne. The deputation reported in favour of steam locomotive power, and in accordance with their decision, the company offered a premium of £500, for the best locomotive engine, which should draw on a level plane three times its own weight, at ten miles an hour, which was not to exceed six tons. There were several other stipulations, among which the cost of the machine was not two exceed £550; the height of the chimney was restricted to fifteen feet, and the pressure on the boiler to fifty pounds the square inch, and was to consume its own smoke; be supported on springs, etc.

The 8th of October, 1829, was fixed for the trial, and on the appointed day, five engines were brought forward to contend for the prize; a competition which involved a vast deal more than the winning of £500. Stephenson was there with his "Rocket;" Hackworth, with the "Sanspareil;" Braithwait and Ericson, with the "Novelty," Burstall, with the "Perseverance;" and Brandreth with the "Cyclopede." The latter was a horse-locomotive, and was therefore not considered as entitled to run for the prize. It was tried, however, as a matter of experiment, but its speed was only about six miles an hour. After a brief trial, the "Perseverance" was withdrawn, leaving the three first mentioned the sole contenders. The test assigned, was to run a distance of thirty miles, at not less than ten miles an hour, backward and forward along a two mile level, near Rainhill, with a load three times the weight of the engine. The "Novelty," after running twice along the level, was disabled by failure of the boiler plates, and withdrawn. The "Sanspareil" travered ed eight times, at a speed of nearly fifteen miles an hour, when it was stopped by derangement of the machinery. The "Rocket," was the only one to stand the test and satisfy the conditions. This engine travelled over the stipulated thirty miles, in two hours and about seven minutes, with a speed at times of twenty-nine miles an hour, and at the slowest, nearly twelve; in the latter case exceeding the advertised maximum, in the former tripling it, and of course gaining the prize. Here was a result! An achievement so surprising, so unexpected, as to be almost incredible. Was it not a delusion? had it been really accomplished? and could it be done again? When Mr. Stephenson was examined before a committee of the House of Parliament, some four years previous to this triumph with the "Rocket," he stated, that he saw no difficulty in constructing a locomotive that would travel from fifteen to twenty miles per hour—which remark provoked one of the members to reply, that the engineer could be only fit for a lunatic asylum. Even Mr. Nicholas Wood, who was appointed one of the judges to award this premium of £500, had a short time previously, published his opinion respecting locomotives, as follows:—"It is far from my wish to promulgate to the world, that the ridiculous expectations, or rather professions of the enthusiastic speculatist will be realized, and that we shall see engines travelling at the rate of twelve, sixteen, eighteen or twenty miles an hour. Nothing can do more harm toward their adoption or general improvement, than the promulgation of such nonsense." And that the directors of the Liverpool and Manchester railroad, in a measure agreed with this opinion, is evident from their appointing Mr. Wood an umpire, and only requiring the engines to travel with three times their weight, at ten miles an hour. In fact, with the exception of a most limited circle of truly scientific and practical men, who from actual experiment had demonstrated the fact to be otherwise, the general opinion at that time was—even should the whole system of railroad travelling be perfected according to the most sanguine expectation of its projectors—the maximum of speed obtained, under any circumstances, could not exceed ten miles per hour. Thus the performance of the "Rocket," had such a startling effect, not only on the local community where it occurred, but throughout the whole civilized world; and from that moment is marked the grand epoch in rapid locomotion, which has by a succession of improvements arrived at the very acme of excellence.

The inventive talent of our own country has been much exercised in the steam power, and its appliance to navigation, has rendered the name of Fulton immortal and the locality of the Hudson river, ever memorable in history. But we were not without experiments in the steam carriage, and finally, when that important fact was promulgated, its greatest perfection was first arrived at by our own skilful mechanics and engineers. However as early as 1772, Oliver Evans, of the city of Philadelphia, began to experiment on steam, with a view toward employing it as a substitute for animal power. In 1786, he petitioned the legislature of Pennsylvania, for the exclusive right to use his improvements in mills, and his *steam wagons*, in that State. The committee to whom the petition was referred, heard him very patiently while he described the mill improvements, but his representations concerning steam wagons, made them think him insane; his petition, as regarded the wagon, was refused. Evans foresaw that steam would one day be the prime agent of locomotion, and he frequently declared that the time would come when travellers would be conveyed on turnpike roads at the rate of fifteen miles an hour, or three hundred miles a day, by a contrivance similar to his own. In 1804, O. Evans, applied steam power to the propulsion of a *boat* upon dry land. The boat was built for a dredge, and as the workshop was at some distance from the water, it was launched by fitting up driving wheels under it, and running it over land and into the water. There are other Americans who might be mentioned in this connection.

(To be continued.)

Paris Fuel Shops.—The fuel with which to cook a dinner in Paris costs nearly as much as the dinner itself. Fuel is very scarce, and the American is surprised to find shops all over the city, fitted up with shelves like those in shoe stores, upon which is stored wood, split up in pieces about the size of a man's finger, and done up in bundles, as matches were in the days of the tinder box, steel and flint; they are about the size of a bunch of asparagus. These little bundles sell at from two to six sous. Larger sticks are bundled up in the same way, and sell at a frightful price. Charcoal is sold by weight, and hard coal, being nearly as expensive as wood, can be bought in the smallest quantity at any of these fuel shops. They are generally kept by women. The windows of these shops are often decorated with a curtain or inside shutter, upon which split wood and round wood are painted to represent the bundles sold inside.

The more we help others to bear their burdens, the lighter our own will be.

Fresh water springs in the Mediterranean.—Fresh water springs exist in the sea, near the shore, which are more or less copious, according to circumstances; but those of Stamfane Rock and Syracuse are popularly held to proceed from the Alpheius, by submarine communication. In the Gulf of Spezzia there is a spring which constantly discharges a very considerable body of water, rising with such force as to produce a slight convexity of the surface; this stream is probably derived from a system of cavernous passages in the neighbouring limestone rocks, but its place, as marked on my plan of the Gulf, has been immemorially the same. In the *Mare piccolo*, or great port of Taranto, and at some distance from the mouth of the Galesus, fresh water springs up in such force and abundance that it may be taken up without the least brackish mixture; and in the briny lagoon of Thau, at Cette, there is a deep spot called the *Aeysse*, from which rushes up a column of potable water, with such force as even to make waves. Near Ragusa, the Kalamota Channel terminates in the port called Val d'Ombia, which is watered by the Ariona, a subterranean river bursting up with amazing volume and force from the foot of Mount Bergatz; fresh water springs are also copious in the Gulfs of Cattara and Aulona. At Agio Janni, below Parga, between the mouths of the Acheron and Thyamis, is a circular space of fresh water, about forty feet diameter, rising through the sea with great activity: this is probably the ascending spring alluded to by Pausanias (*Arcad.* vii.) Off the little desert islet Ruad, near Tortosa, on the coast of Syria, a spring of fresh water rushes up in the sea in such volume that it may be skimmed off without the slightest impregnation of salt. "You may draw up potable water," says Pliny, "out of the sea about the Chelidonæ Islands and at Aradus;" and there must be many unrecorded jets of the same nature mingling with the sea unnoticed.—*Admiral Smyth's Memoir of the Mediterranean.*

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 252.)

HANNAH CARPENTER.

Hannah Hardiman was born at Haverford West, South Wales, in the year 1645 or 6. As she grew in years, she increased in religious thoughtfulness, and observing the christian patience of Friends in their sore imprisonments for conscience' sake, and their innocent walking, and godly conversation in Christ, her heart was drawn towards them, and after a time, through the openings and sealings of the Holy Spirit, she was herself convinced of the Truth. It is noted that she became very "serviceable to those who were in bonds for Christ's sake."

Soon after William Penn had obtained the Province of Pennsylvania, a concern came upon the mind of Hannah Hardiman to remove thither, and after much conflict of spirit, she gave up to the requiring of duty. She came to Pennsylvania, and settled in Philadelphia about the year 1683, in which year Samuel Carpenter, from Bridgetown, Barbadoes, was led to the same place, to establish himself in business. The two Friends, both of whom were earnestly seeking to be found in the way of their duty, became acquainted with each other, and were married on the 12th of the Tenth month, 1684. Samuel Carpenter was a prosperous man in business, and had great possessions, but the abundance of this world's goods appears not to have interfered to prevent him and his wife walking in the simplicity of Truth, and maintaining in life and conversation the self-denying cross-bearing doctrines of the gospel. Their house was open for the entertainment of Friends, their hearts open to comfort the distressed and afflicted, and their purse open to relieve the wants of the destitute. It was to their dwelling that that worn out servant of Jesus Christ, Robert Barrow, was carried on his arrival at Philadelphia, after his captivity among the Indians in Florida. There he gave utterance to many remarkable expressions as he gradually declined in strength, and there finally, through the strength vouchsafed him by the Lord his God, he was enabled joyfully to lay aside the shackles of mortality, and to enter into his rest.

Hannah Carpenter was not at this time in the station of a minister, but a living concern for those who laboured in word and doctrine, was in her mind. She was no doubt an anointed elder, qualified to drop a word of caution, to administer counsel, and when it seemed requisite a little comfort also. In the year 1698, near its close, she felt constrained to prepare an address to those engaged in the ministry, which was read in the General Meeting of Ministers, held First month 4th, 1699.

Her friends say of her, that "her heart and house stood open to receive and entertain the true gospel ministers to whom she was a tender nursing mother, both in sickness and in health. She was a bright example of love and meekness, as well in the church, as in her own family."

She was somewhat in years when she married, yet having several children, she was one truly concerned to restrain and educate them in the nurture and admonition of the Lord. Whilst some of her children were still young, she prepared the following epistle to parents, respecting the education of children:

"Upon the 4th day of the Fourth month, I was drawn forth to wait on the Lord, and as I was waiting, the consideration of my dear children whom the Lord had taken to himself in their innocency, came before me, and my soul blessed his holy name for his great love towards them and me, in that they are gone to their rest, and shall never partake of those exercises and sorrows these do that remain in the world. Then my soul was poured forth before the Lord for them that remain, that as they grow up in years, they may grow in grace, and in the knowledge of our Lord and Saviour Jesus Christ. I would rather follow them to their graves whilst they are young, than that they should live to the dishonour of his worthy name. Then a more general and weighty concern came upon me for the children of Friends that are grown up, and do not come under the yoke, nor bear the cross. Oh! the cry that ran through my soul. In the anguish and bitterness of my spirit, I said, 'Lord, what wilt thou do with Friends' children when we are gone off the stage of this world? Wilt thou raise up children, and not those of believing parents?' This was the word that livingly sprung up in my soul. They reject my counsel, and cast my law behind their backs, and will have none of my reproofs, and though my hand be stretched forth all the day long, yet they will not hear, but go after their own hearts' lust. Then I said in my heart, 'Lord, are they all so?' The answer was, There are some that are innocent, whom I will bless, and they shall shine forth to my praise. Now, oh, friends! dwell and abide in the innocent life, that so the blessing of the Lord you may feel daily to descend upon you. As for you that 'reject the counsel of the Lord, and cast his law behind your backs, and will have none of his reproofs,' sorrowful sayings concerning the children of believing parents, you who are under the profession of the Truth, which will do you no good, unless you return unto the Lord, I desire you may all return unto him, whilst the day of a long-suffering merciful God lasteth. But if you st reject the counsel of the Lord, the many faithf warnings you have had, how will you answer it the day when He cometh, 'To render unto every o according to their deeds?' And now, somethi further is with me to parents. Dear friends, y that have been convinced of God's unchangeab truth, and have known the operation of it, workin out and bringing down that which was of a contra nature to it; Oh, that we may all abide faithful i his work, and retain our integrity to the Lord, th let our breathing cries and prayers be offered up the Lord for our children, that he would be please to look down in mercy upon them, and visit them he did our souls. David said, 'If I regard iniqui in my heart, the Lord will not hear me;' so I d sire we may all be clear in our offerings before t Lord, that he may smell a sweet savour from then

"Dear friends, what is here written is with gre caution, knowing that I have children of my ow and that many honest parents have bad childre which is no small exercise. But if we keep faithf to the Lord, and discharge our duty to them precept and example, we shall be clear of them the sight of God: and therefore, friends, faithfu ness is the word that runs through me, not only f our own souls, but for our children's also; that generation may grow up to his praise in this part the world, when our heads are laid in the du Great and manifold hath the love and mercy God been towards us! the consideration of it, ma times hath deeply affected my mind. It was He the arm of power that reached us, and brought concern upon us in our own native land. I do b lieve that many had as clear a call to leave the native country, as some of old had. This caus many days and nights of sore travail and exerci before the Lord, and no ease could we have, but giving up life and all unto him, saying, 'Lord, what thou wilt with us, only let thy presence pr serve us.' To his praise we can say, he hath be with us since we came to this country, and ha preserved us through many and various exercise both inwardly and outwardly. And now that whi lies on our parts I desire may be considered by all, that so suitable returns may be made unto t Lord, by walking in humility and godly fear befo him; that so good patterns we may be, by keepi our places, 'To the praise of him who hath call us,' for he is worthy forever more. Something ma is with me, which I thought to omit, but find I ca not well do it, concerning our children, that we very careful while they are young, that we suff them not to wear such things as Truth allows n It may be said they are but little things, and w enough for children. But we find when they a grown up, it is hard for them to leave off which, may be, if they had not been used to, when you would not have been expected when grown up. desire we may all be clear in ourselves, and le our children out of the fashions and customs of th world. And oh! that we were all of one he and mind, in these and other things, then would t work of the Lord go on easily, which is the sinc desire of your Friend, HANNAH CARPENTER."

After the death of her husband, she received gift in the ministry, but does not appear to ha visited Friends in other Provinces. Her minist "was seasoned with a lively savour of divine swe ness, and though not frequent in her appearan it was very acceptable to her Friends." Her l and conversation being adorned with the christi virtues of benevolence and charity, rendered l beloved and respected, and useful in her statio She departed this life on the 24th of the Fifth m 1728, in the 83d year of her age.

(To be continued.)

Some Experiments on the Smoke of Tobacco.—Froriep's Journal, of a recent date, an interesting article has been published on the habit of tobacco smoking, and on poisoning by nicotine. Among the facts there mentioned, are experiments instituted by M. Malapert, a pharmacien, of Poitiers. His intention was to ascertain the exact quantity of nicotine absorbed by smokers, in proportion to the weight of tobacco consumed.

The apparatus used consisted of a stone jar, in which the tobacco was made to burn, connected with a series of bottles communicating by tubes. The bottles were either empty, or contained some water mixed or not with a little sulphuric acid. In a few experiments it was found that, in the smoke of tobacco extracted by inspirations, there is on per cent. nicotine. Thus a man who smokes a cigar of the weight of seventy grains, receives in the mouth seven grains of nicotine, mixed with a little watery vapour, tar, empyreumatic oil, &c. Although a large portion of this nicotine is rejected, both by the smoke puffed from the mouth, and by the saliva, a portion of it is, nevertheless, taken up by the vessels of the buccal and laryngeal mucous membrane, circulated with the blood, and acts upon the brain. With those unaccustomed to the use of tobacco, the nicotine, when in contact with the latter organ, produces vertigo, nausea, headache, and somnolence; while habitual smokers are merely thrown into a state of excitement, similar to that produced by moderate quantities of wine or tea. From further investigation it was found that the drier the tobacco the less nicotine reaches the mouth. A very dry cigar, while burning, yields very small amount of watery vapour; the smoke passes rapidly, and allows the condensation of the nicotine before it reaches the mouth. Hence it appears that the first half of a cigar smokes more fully than the second, in which a certain amount of condensed watery vapour and nicotine, freed by the first half, are deposited. The same remark applies to smoking tobacco in pipes, and if smokers would be prudent, they would never consume but half a cigar or pipe, and throw away the other. Smoking through water, or with long tubes and small bowls is also a precaution which should not be neglected.

"Why is there a price in the hand of a fool to get wisdom, seeing he hath no heart for it?" Prov. xvii. 17.)

The natural relation of man to divine wisdom may be illustrated by a valley or basin, with a stream or brook passing through it. The stream is unproductive of no real benefit either to the valley itself or its immediate neighbourhood. It enters at one side and passes out at the other, leaving everything in its course unblest by its presence. Stop the course of this stream at the point of egress, and the valley anon becomes a lake, reflecting from its placid bosom the glowing imagery of every surrounding object. But the lake thus formed not only plants a new and beautiful feature in the landscape, it moreover becomes the conservator of a mighty water power for the service of man, and adds to the wealth and resources of the neighborhood.

So is it with wisdom in the hand of a fool. It flows at one ear, and passes through an empty void out at the other. There is the stream of daily experimental instruction, but there also is the pitiable and empty valley through which it pursues its unconscious and uninterrupted course. In the case of the wise man, this stream is arrested in its progress by reflection and study, and after filling the empty intellect of the possessor, it becomes a reservoir of wisdom, knowledge, and understanding, and a feeding source of accumulated power in the service of others.—*Original Reflections by J. E. Gordan.*

For "The Friend."

To the Annual Meeting of the Tract Association of Friends.

The Managers report, that on the 1st of Third month, 1855, we had on hand 236,162 Tracts, and that our distribution during the year, has been 79,967 "

Leaving on hand, Third month, 1st, 1856, 156,195 "

in which is included 138 bound volumes.

595 of the Select Readers, 2221 Juvenile Books, and 7228 Almanacs, have been disposed of during the year.

Of the tracts distributed, we have information of the destination of most,—For Philadelphia city, there were taken,

For Prisons { Moyamen.	3,639	4,296
For Prisons { E. Peniten.	657	
" Almshouse, Blockley,		126
" Sch'ls & Lib. Inst'ns—		
First-day Schools,	575	
Schools for Col'd Persons,	1,179	
A Public School Teacher,	101	
Students in Med. Colleges,	910	
Students in Penn. Univ.,	421	
Medical Convention,	850	
Kens. Apprentices' Lib. and another Pub. Lib.,	202	
		4,237
Infidels, Universalists, &c., { distributed at their meetings,		3,800
Courts of Law,		300
Total Abstinence Society,		125
Appl'ts for relief at Soup-houses,		5,300
R. Road stations, R. R. cars, & steam-boats, includ. the Boston steamers, from this port,		3,626
For a sick man, going to Florida,		101
An inquirer after Truth,		15
Private reading in a coloured man's family,		41
Distribution in various parts of the city,		1,556
Total distribution in Philadelphia,		23,523
For various places in Pennsylvania, have been taken,		4,549

Of these, some were for schools, two sets were given to public libraries, one set for the Montgomery county prison, six sets for the Western Penitentiary near Pittsburg, and 300 were distributed amongst those gathered to hear an infidel lecture at Norristown.

The following have been taken for other parts of the United States:

For the New England States,	1,199	
" New York,	232	
" New Jersey, a considerable number of which were for Cape May and Atlantic city, and one set for a library at Greenwich,	4,623	
For Delaware,	111	
" Maryland, including a set for Baltimore Lunatic Asylum,	854	
For District of Columbia,	678	
" Virginia,	317	
" North Carolina,	246	
" Georgia,	101	
" Kentucky,	101	
" Ohio,	1,764	
" Michigan,	101	
For Indiana, including 13,325 to Central Book & Tract Asso.	13,395	
For Illinois,	606	
" Iowa, including 303 for a Friends' school,	1,010	
For Missouri, a lib'y in St. Louis,	101	
		25,439
		53,511

There have been taken for foreign places:

For Canada,	505	
" Port au Prince, including a set for a mixed school,	505	
For Hamburg, Germany,	202	
" Geneva, Switzerland,	101	
		1,313
Sold for Cash,		11,805
Taken for distribution, the intended destination not ascertained,		13,338
Making the whole distribution, as before,		79,967

Our distribution, during the year just closed, has exceeded that of the preceding one, 13,447. Our edition of the Almanac of 1856 has been generally disposed of, and a considerable amount of selections have been made, and approved by the Board for an Almanac for the year 1857. One new tract has been added to our series during the past year, as number 102. Its title is "Ralph Dixon, the converted soldier." It is now being stereotyped, and by the time of the annual meeting, we hope to have an edition printed and placed in the depository for distribution.

We doubt not but that our tracts are often blessed to the reader, whether they are sought for in solitude, in sickness or sorrow, for comfort and instruction, or whether in populous steamboats or crowded cars, they are taken up for a transient perusal, or to occupy time. In these last instances, light and foolish conversation have doubtless often thereby been prevented, and some tenderness of feeling has been produced, even when no greater or more permanent good appears to have been effected. The measure of success, however, is not the measure of duty. He who, with a single eye to the pointings of the Lord's finger, labours on in the path of obedience, doing what he feels is his present service, whether he sees any good effect springing therefrom, or not, is he that is accepted in the sight of his heavenly Father. The good he aims to do to others, if his actions spring from a sense of duty, and not to win the applause of his fellows, will in measure return unto himself with a blessing, and the Lord's gracious visitations may, unknown to him, accompany and prosper his labour.

By direction and on behalf of the Board of Managers, EDWARD RICHIE, Clerk.

Philad., Third mo. 12th, 1856.

Clerk—Nathan Kite.

Treasurer—Joseph Scattergood.

Managers—John C. Allen, Edward Richie, Horatio C. Wood, Samuel Bettle, jr., Charles J. Allen, Samuel Allen, Charles Jones, John L. Kite, William Kinsey, jr., James Kite, Mark Balderston, Jesse Williams, Nathaniel H. Brown, Samuel Fogg, and Joseph S. Elkinton.

The Relief of the Wrecked.—We have before referred to the howitzer and apparatus at Nantucket, for communicating with vessels wrecked on the shores of Nantucket. The howitzer was successfully tried on Monday in the case of the two schooners ashore there. The experiment convinced those making it that, with solid shot, a small line could be thrown to a vessel 200 fathoms from shore.—*New Bedford Standard.*

Selected.

DO RIGHT.

Awake, oh, soul, thy hours are fleeting,
Thy life is rapidly completing,
Time with eternity is meeting,
Soon comes the night.
Thy retribution too will come,
According to thy state, thy doom.
Do right, do right.

Though clouds thy firmament o'erspread,
And tempests burst around thy head,
Though life it's greenest foliage shed,
In sorrow's blight:
And though thy holy hopes and fears
Lie buried 'neath the gathering years—
Do right, do right.

The warring element's worst wrath,
The earthquake and the whirlwind's breath,
The valley and the shade of death,
Need not affright;
For duty's calm commanding form,
With rainbow arms shall clasp the storm.
Do right, do right.

Faint not in all the weary strife,
Though every day with toil be rife,
Work is the element of life,
Action is light;
For man is made to toil and strive,
And only those who labour live.
Do right, do right.

Life is not all a fleeting dream,
A meteor flash, a rainbow gleam,
A bubble on the floating stream,
Soon lost to sight;
For there's a work for every hour—
In every passing word a power—
Do right, do right.

Oh! life is full of solemn thought,
And noble deeds if nobly wrought—
With fearful consequences fraught,
And there is might—
If gathered in each passing hour,
That gives the soul unearthly power.
Do right, do right.

For "The Friend."

The excellent counsel contained in the epistle addressed to Friends in 1686, by Thomas Ellwood, is so applicable to the condition of things in the Society at the present time, that I would be glad if the Editor of "The Friend" would give it, or some extracts from it, a place in its columns.

A CONSTANT READER.

In the early part of the succeeding year, 1686, Thomas Ellwood published a general Epistle to Friends, in which he endeavoured, with affectionate earnestness, to check the tendency to division and declension which had then manifested itself in the Society; exhorting his fellow-members to maintain a true consistency of conduct, and to guard against the injurious effects of a worldly spirit, as follows, viz:

"Dear friends, unto whom the gathering arm of the Lord hath reached, and who have known, in your several measures, a being gathered thereby into the heavenly life, and are witnesses of the preserving power, by which you have been kept faithful to the Lord, and regardful of his honour: unto you, in an especial manner, is the salutation of my true and tender love in the Lord; and for you, as for myself, are the breathings and fervent desires of my soul offered up, in the one Spirit, unto him who is your God and mine, that both you and I may be for ever kept in the fresh sense of his tender mercies and great loving-kindness unto us, that therein our souls may cleave firmly unto him, and never depart from him. For, friends, it is a trying day, a day of great difficulty and danger, wherein the enemy is at work, and very busy, setting his snares on every side, and spreading his temptations on every hand; and some, alas! have entered thereinto, and are caught and held therein, for whom my soul in secret mourns.

"And truly, friends, a great weight hath been upon my spirit for many days, and my mind hath been deeply exercised, in the sense I have of the enemy's prevailing by one bait or other, to unsettle the minds of some, unto whom the arm of the Lord had reached, and in some measure gathered to a resting-place: but not abiding in that pure light, by which they were at first visited, and to which they were at first turned, the understanding hath been veiled again; the eye, which was once in some measure opened, hath the God of this world insensibly blinded again, and darkness is come over them, to that degree, that they can now contentedly take up again, what in the day of their convincement, and in the time of their true tenderness, they cast off as a burden too heavy to be borne. O my friends! this hath been the enemy's work; therefore it greatly behooves all to watch against him: for it hath been for want of watchfulness, that he hath got entrance into any. For, when the mind hath been from off the true watch, in a secure and careless state, then hath he secretly wrought, and presented his fair baits, his allurements or enticements by pleasure or profit, to catch the unwary mind. And hence it hath come to pass, that some, who have come out fairly, and begun well, and have seemed in good earnest to set their hands to God's plough, have looked back, and been weary of the yoke of Christ, and have either lusted after the flesh-pots of Egypt again, or turned aside into some bypath or crooked way in the wilderness, and thereby fallen short of the promised good land.

"But you, my dear friends, in whom the word of life abides, and who abide in the virtue and savour thereof, ye know the wiles of the enemy, and the power which subdues him, and the Rock in which the preservation and safety is. So that I write not these things unto you, because ye know them not; but the end of my thus writing is, to stir up the pure mind in all upon whom the name of the Lord is called, that we all may be provoked to watchfulness against the workings of the wicked one. Therefore, dear friends, bear, I beseech you, the word of exhortation, though from one that is little and low, and through mercy sensible of it, and who hath not been accustomed to appear after this manner; but the wind, ye know, bloweth where it listeth.

"Friends, call to mind the former times, and remember the days that are past and gone, when the day of the Lord first dawned unto you, and his power seized upon you. Ye know how weighty and retired the spirits of Friends then were; how grave and solid their deportment and carriage; how few and savoury their words, tending to edify the hearers; how great a fear and backwardness was in them, to enter into familiarity with the world's people. O friends! that was a good day, and that was a safe state; for fear begets watchfulness, and watchfulness is a means to prevent danger. Therefore, all friends, keep in the holy fear, and therein watch against the enemy, that he entangle you not, nor hurt your spirits by a too near familiarity, and intimate conversing with the people of the world; for therein, I assure you, lies a snare.

"For though it be both lawful and necessary, and in some cases also useful and serviceable to the Truth, to converse with them that are without; yet if any Friend should adventure in a frank and free mind, beyond the limits of the pure fear, to entertain familiarity with the world's people, the spirit of the world in them will seek an entrance; and, if not diligently watched against, will also get an entrance, and bring a hurt and a loss upon him or them into whom it so gets. For being once entered, it will insensibly work, and dispose the mind to condescension to and compliance with the people of the world it converses with, first in one thing, then in another; in words, in behaviour, &c., little things in appearance, but great in consequence, till at length an indifferency gets up in the mind, and a testimony of truth by degrees is let fall. But where the pure fear is kept to and dwelt in, the watch always set, the spirit is retired and weighty, and the holy awfulness rests upon the mind, which renders such converse both safe to the Friends, and useful serviceable to them they converse withal.

"And, friends, not only in your conversing with the world's people, but in all your conversation in the course of life, watch against the spirit of the world, for it lies near to tempt, and to draw out the mind and to lead back into the world again. You know, friends, that at the first, when the visiting arm of the Lord reached to us, he led us out of the world's ways, manners, customs, and fashions; and a clear testimony, both in word and practice, was borne against them. But how hath this testimony been kept up, and kept to, by all who have since made profession of the Truth! Ah! how hath the enemy, for want of watchfulness, stolen in upon many, and led out their minds from that which at first convince them, into a liberty beyond the cross of Christ Jesus! and in that liberty they have run into the world's fashions, which the worldly spirit continually invents to feed the vain and airy mind withal, that they may not come to gravity and solidity.

"Thence it hath come to pass, that there is scarce a new fashion come up, or a fantastic cut invented, but some one or other, that professes Truth, is ready with the foremost to run into it. Ah, friends! the world sees this, and smiles, and points the finger at it. And this is both a hurt to the particular, and a reproach to the general. Therefore, O! let every lot be cast; let search be made by every one, and let every one examine himself, that this Achan, with his Babylonish garment, may be found and cast out; for indeed he is a troubler of Israel.

"And all friends, who upon true search shall find yourselves concerned in this particular, I warn and exhort you all, return to that which at first convinced you; to that keep close, in that abide, that therein ye may know, as at the first, not only a bridle to the tongue, but a curb to the roving mind, a restraint to the wandering desire. Assuredly, friends, if truth be kept to, none will need to learn of the world what to wear, what to put on, or how to shape and fashion their garments; for Truth will teach all how best to answer the end of clothing, both for useful service and modest decency. And the cross of Christ will be a yoke to the unruly will, and a restraint upon the wanton mind; and will crucify that nature that delights in finery and in bravery of apparel, in which the true adorning doth not stand, but in the hidden man of the heart, in that which is not corruptible, even a meek and quiet spirit.

"And the grace of God, which hath appeared to all, and which hath brought salvation to many, will not only teach to deny all ungodliness and worldly lusts, and to live soberly, righteously, and godly in this present world, but will also lead those that obey it, out of all excess, and out of all superfluities and worldly vanities, and will teach them to order their conversation aright. Therefore to those heavenly grace let every mind be turned, and there in stayed; that thereby all who profess the Truth may be kept in the holy limits of it; that in the whole conversation and course of life—in eating, drinking, in putting on apparel, and in whatsoever else we do or take in hand, all may be done to the glory of God, that our moderation in all things may appear unto all men."

For "The Friend."

Divine Protection.

A proper education in the faith and practice of ends, confers many important advantages. If foundation is rightly laid, and the mind turned the Holy Spirit, for strength and guidance to k conformably thereto, the blessing of the Lord ch makes truly rich, as he is obeyed, will yield stantial enjoyment, and induce a course of life ch may be blessed to many in the world. Our oved and honoured friend, Henry Hull, was an ance, and his remarks on a visit to Ireland, are l worth perusing:

In being in Enniscorthy, Wexford, and other ghbouring places," he says, "the horrors recently duced by the rebellion seemed to be revived in mind, giving rise to various and sorrowful re- tions, and leading me to contemplate the mercy strength of omnipotence. Great, indeed, *was Lord's kindness to Friends*, preserving them dst the dreadful carnage, as well as the suffer- s which others passed through. When human od flowed in streams through the streets, and ltitudes were piked and thrown into the rivers, nt in barns, houses, &c., and in many other s tortured and slain, not one Friend was known be killed, save a young man who *forsook his ceable principles*, and took arms for his defence. we forsake Omnipotence, whither shall we flee help? If he is humbly relied upon, he will be o his people as a wall of defence, and make a y where there appears to be no way. But too ny of those who saw these marvellous works of Lord, and how his delivering power was vouch- d, have forgotten these his mercies, and gone ir own ways into the world. Alas! saith my l for these.

So evident were the favours shown to Friends, t many other persons sheltered themselves in ir habitations, and those of the Society who had viated from the plain attire by which Friends generally known, now saw their folly. In se calamitous times, fashionable clothing of an pensive kind, was rather a passport to death n to honour; and at all times it is more an evi- nce of a weak understanding, than of a sound nd; for neither religion nor reason point it out a means to promote the usefulness of the wearer. e great departure from plainness, which is evi- nt among many of our young people, is rather a oof of their folly and ignorance, than of wisdom; ce it is beneath the dignity and nobility of a ristian mind, to be so much employed about, and ased with the covering of the body. In some, may be more the effect of the parents' pride, n that of the children's; but this testimony of r Society, to a simple, useful, and not expensive nner of dressing and living, is grounded in the uth, and *innovations will never be able to sap e foundation or overthrow it.* I would recom- end to my dear young Friends, to endeavour to e from whence those desires arise, which lead em to follow and copy after the fantastical dresses d habits which are so continually changing. eatness and cleanliness are certainly commend- le, and if rusticity is offensive, simplicity is not; d surely simplicity and self-denial become a ople called, as we are, to bear a testimony to the rity of the religion of Jesus Christ. I grant, at there is no religion in the cut or colour of a rment, but the exterior appearance is often an dex of the mind; and if the inside of the cup and atter be made clean, the outside will be clean so; men do not gather grapes of thorns, nor figs thistles; and conformity to the world in any of s corrupt ways and fashions, is not a being trans- rmed, as the Scriptures of Truth exhort.

"Let us, therefore, strive so to walk in all things, as the redeemed of the Lord, who make no provision for the flesh to fulfil the lusts thereof; but who are concerned to live unto Him who died for them, that the blessed and happy state of the redeemed ones may conspicuously appear in the eyes of the world, that others may be induced to seek a release from the bondage there is in sin and corruption, and in all the world's evil ways and fashions. Evil communications corrupt good manners; where the precious gives way to the vile, good is oppressed, and evil is advanced; thus by little and little the oppressor may gain the ascendancy over the redeemed, and bondage may increase, and their suffering will be unavoidable. I much desire that the children of Friends may not be brought up in ignorance so as not to know the grounds of the religious principles they profess, and why plainness is more commendable than imitating those who change, because fashion is changeable."

The remarkable protection extended to Friends in Ireland at a time of dreadful massacre, is worthy of being held in perpetual remembrance, inciting gratitude and dedication to the Lord on high, who is mighty to save them that put their trust in Him. Holy communion with him humbles the creature, and prepares us to ask of Him that protection, and to put our trust in his mercy and all powerful arm for our defence against the assaults of the evil one.

THE FRIEND.

FOURTH MONTH 26, 1856.

PHILADELPHIA YEARLY MEETING.

This body has been in session two days when we write this, and has made good progress in its business. The meeting is very large, and much interest is manifested in the proceedings. We defer a detailed account of the meeting until a future number.

From time to time we have been receiving accounts of the "outrages" of the Indians in Oregon and Washington Territories, and of summary vengeance being taken on them, until the destruction of the poor aborigines has become so common among a lawless set, who have emigrated there, that there is danger of the public ear being familiarized with relations of the deeds committed so as to take little heed of them, or to conclude that killing Indians is a small matter, justifiable and perhaps unavoidable. Very many are prepared to believe, as a matter of course, that this poor people are always in fault; and others may be imperceptibly drawn to attribute to them all the cause of the different disturbances; but it would be well to keep in mind that the Indians have no newspapers to spread abroad the cruelties inflicted on them, and the wrongs which they suffer. The impositions practised on them, are mostly concealed, their conduct misrepresented, and false stories fabricated either to furnish pretexts for waging war on them, or to cover up murders already committed. Many of the desperadoes, who roam over the lands belonging to the western tribes, seem to think no more of killing a native than they do of shooting a buffalo, hoping that the sooner they are exterminated, the sooner they can seize upon their possessions. Is it to be wondered at, that the poor savage, often driven to desperation by the wrongs inflicted on him, seeks at times to revenge himself on his merciless persecutors, and commits deeds of blood, which are blazoned abroad as natural fruit of his blood-thirsty disposition, or the habitual course of his policy.

We are glad to see that General Wool, who is in command in that section, seems disposed to develope the truth, and to instruct the Government in the cruel course pursued by the whites, and the grevious wrongs inflicted on those who have been so much traduced, and whose broad acres excites the cupidity of their vagabond persecutors.

The following exhibits some of the cruelties committed:—

A camp of Lapan Indians had been suprised by Col. Lenagua, when a conflict took place in which the Indians lost 40 killed. One hundred prisoners were captured.

A letter from a reliable source to the Editor of the National Intelligencer, alludes as follows to the commencement of the Indian difficulties in Oregon Territory:

"In October last, twenty-five Indians, of whom eighteen were women and children, were met by Major Lupton and his party of volunteers, and all were barbarously murdered. These were friendly Indians going to the military reservation for protection. In December last, two similar massacres by volunteers were committed on the north and south side of Rogue river, near Butte creek, about fifteen miles from Fort Lane."

This presents a shocking spectacle of men, women, and children butchered in cold blood, while they were seeking protection among their white and professedly civilized neighbours. It exhibits an indifference to the value of human life, and a cruelty which, we could hardly have believed, would be found in men living in a country, where the benign religion of Jesus Christ is professed. Even among soldiers, we should expect that life would be held sacred, where there was no indication of hostility or resistance, and especially where the comparatively feeble and endangered were seeking to throw themselves upon the kindness and hospitality of their supposed friends and defenders. In Congress, where the subject of "Indian hostilities" has been discussed, there has been a difference of opinion respecting the origin of the troubles.

Campbell, of Ohio, from the Committee on Ways and Means, to which had been referred the bill for the suppression of Indian hostilities in Oregon and Washington Territories, reported a substitute appropriating $300,000 to be expended under the direction of the President, for restoring and maintaining a peaceable disposition on the part of the Indian tribes, on the Pacific coast, and $120,000 for the purchase of gunpowder.

Campbell, of Ohio, said the original bill contemplated rather a warlike movement, but the Committee thought it would be better to report a measure looking to peace on the frontiers, as recommended by the Secretary of War.

Campbell, of Pennsylvania, was in favour of voting the money forthwith, and holding the Administration to an account hereafter.

Ready said it was sufficient for him to know that hostilities exist to justify an appropriation for their suppression.

Lane, of Oregon, proceeded to show that the war had been commenced by the Indians, and was not instigated by the whites, whom he eulogized as orderly, peaceable and gallant. The day had passed when Gen. Wool could chastise the Indians in the Territory.

Anderson, of Washington Territory, insisted on the necessity of the appropriation. It was not to fit out military expeditions, or to pay one dollar of the expenses of the war, but to preserve peace with the friendy Indians, by supporting them on their reserves, and preventing them joining the hostile tribes.

Zollicoffer, referring to the conflicting statements about affairs in Oregon and Washington, thought some investigation necessary before voting the money.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 5th inst.

THE PEACE CONGRESS.—The Treaty of Peace was signed at Paris on the 30th ult. Parliament reassembled on the 31st ult. In reply to a query, Lord Palmerston said that, although the treaty of Peace was signed, yet it was determined by the Conference, that the particular conditions should not be made public until the ratifications were exchanged. At the same time he would express his conviction that the treaty would be deemed satisfactory by England and by Europe. The treaty, he said, was honourable to all the contracting powers, and while, on the one hand, it has put an end to the war, which every friend of humanity must have naturally wished to see concluded, on the other hand, it will lay

the foundation of a peace, which he trusted would be lasting and enduring. The declaration of peace was announced in Paris and London by salvoes of artillery. Paris was illuminated, in accordance with previous arrangements. In England, the church bells were pealed in joy over the event. A considerable time will probably elapse before the treaty will be ratified by all the contracting powers, there being still some details requiring adjustment. It is stated that the members of the Conference have still to perfect a number of secondary arrangements, essential to the new state of relations established in the East. Le Nord says one of these is the organization of the principalities, and the Debats says another is special regulations for assuring the free navigation of the Danube. These labours may occupy its attention for a month or more.

RUSSIA.—Peace had been proclaimed at St. Petersburg, and was favourably received. According to the last accounts from St. Petersburg, large transactions were being entered into for the early shipment of tallow, seed, hemp, flax, &c. The navigable Pluster Canal, which has been in the course of construction for many years, and is executed for account of the Russian government, is at length completed, and has just been opened. This canal promises to be of great importance for the internal commerce of Russia, as it allows of uninterrupted communication between the Boug and the Dnieper. For the greater facilitation of this trade, a service of steam tugs is being organized by the Russian government, which will be completed in the course of this summer.

ITALY.—The latest advices from Parma represent the state of the siege in that city to be carried on with the utmost rigour. Everything is subjected to military dictation. The Austrian General, Greneville, appears to be the real Governor of the city. Upwards of three hundred arrests have been made.

LIVERPOOL MARKETS. — Cotton had advanced ⅛d. Breadstuffs were generally unchanged. Consols, 93¾.

INDIA.—The Overland mail had brought Bombay dates to Third mo. 6th. The annexation of the Kingdom of Oude had been accomplished without any disturbance. Lord Canning had been sworn in as Governor General of India. The Santal districts were quiet. A general scarcity was apprehended throughout India, in consequence of the want of rain.

NICARAGUA. — The latest accounts from Central America represent Walker's affairs in a critical, if not desperate position. The detachment of his forces under Col. Schlessinger, had been surprised and routed by a part of the Costa Rica army. The principal army, 3000 strong, under General Mora, was marched upon Nicaragua, and would cross the frontier in eight days. The cholera and fever were making great ravages in Nicaragua among the natives and Walker's army. Some of Walker's people had taken the English mail steamer from Greytown for Costa Rica.

UNITED STATES.—THE INDIAN WAR IN OREGON.—Among the official documents received from Oregon is a letter from Joel Palmer, superintendent of Indian affairs, who, confirming the statements of Gov. Curry, says the present difficulty in Southern Oregon is wholly attributable to the acts of the whites. The Superintendent says, "I cannot but feel it to be our duty to adopt such measures as will tend to secure the lives of these Indians, and maintain the guarantees secured by treaty stipulations. The future will prove that this war has been forced upon these Indians against their will; and that, too, by a set of reckless vagabonds, for pecuniary and political objects, sanctioned by a numerous population who regard the treasury of the United States as a legitimate object of plunder. The Indians in that district have been driven to desperation by acts of cruelty against their people. Treaties have been violated, and acts of barbarity committed by those claiming to be citizens, that would disgrace the most barbarous nations of the earth. If none but those who perpetrated such acts were to be affected by this war, we might look upon it with indifference, but, unhappily, this is not the case."

CONGRESS.—On motion of Charles Sumner, the Senate Committee of Commerce has been directed to inquire into the commerce known as the Coolie trade, by which the Chinese in large numbers are transported from their country in American ships, on alleged contracts of service in distant places. The Senate has ratified two treaties for the benefit of the Indian tribes in Michigan, which make provision for their occupation of lands in that State in severalty, instead of in common, and direct annuities for their moral and industrial improvement. Another treaty has also been ratified with certain Indian tribes in New Mexico, which proposes to concentrate them apart from the injurious influences of the whites, and encourage them in the pursuit of the acts of peace and civilization. A bill has passed the Senate intended to remove from circulation the smaller Mexican and Spanish coins, and providing for the coinage of a new description of cents. The bill for a railroad and telegraph line to the Pacific, has been under consideration. In the House of Representatives, the Senate fortification bill was tabled by a large majority, on the ground that it improperly originated in that body. The Library Committee reported a joint resolution for the purchase of 15,000 copies, at $5 each, of Dr. Kane's Narrative of his Arctic expedition, for distribution among members of Congress, and authorizing the Secretary of the Navy to have appropriate medals struck and presented to Dr. Kane, and the officers and men of the expedition, expressive of the high esteem in which Congress holds their respective merits and services. The resolution passed under the operation of the previous question, by four majority. A reconsideration was subsequently moved and carried.

NASHVILLE, TENN.—On the 13th inst., a fire occurred at Nashville, destroying the Court-house, Nashville Inn, and a number of stores. The aggregate loss of property is stated at $285,000, on which there was an insurance of $171,000.

THE ILLINOIS CENTRAL RAILROAD, is over 700 miles long, 627 of which are already completed. The first letting of the road was made in the Third month, 1852, and 432 miles were in operation before the end of 1854. The receipts for 1855 were $1,532,118; those for 1856 are estimated at a much larger sum. The work has been aided by large donations of public lands, much of which have been sold, but the company still owns more than two millions of acres, and enough it is believed to reimburse the entire cost of the road and equipment.

CALIFORNIA.—San Francisco dates to Third mo. 20th, have been received by the steamship George Law, from Aspinwall, which brought $1,458,502 in gold. The trial of A. A. Cohen has been brought to a close, and the jury has brought in a verdict, deciding that Cohen, as Receiver of Adams & Co., received assets to the amount of $260,046 18—being $121,000 more than he accounted for. The Senate of California had rejected the resolution condemnatory of the election of Speaker Banks, which had previously been passed by the House. The steamer Cortes, which left San Francisco on the 20th for San Juan, took down 100 recruits for Walker's army. The continued dry weather was beginning to create alarm, the miners being unable to work in many places for want of water; the agricultural interest was also suffering. The San Francisco markets were overstocked with all kinds of goods, from Europe and the Atlantic ports. The advices from Washington Territory, state that a body of Indians, 1500 strong, were about to make another attack on the settlements. A conflict had taken place on the White river, between a portion of the Fourth Infantry, under Lieut. Kantz, and a large body of Indians, in which the latter were routed. The Indians were building a fort on White river. A large body was encamped near Table Square. Gen. Wool had arrived at Vancouver, and was preparing to take the field.

NEW YORK.—Mortality last week, 387. Shipments of specie for the week, $698,592.

PHILADELPHIA.—Mortality last week, 213.

MISCELLANEOUS. — LAKE NAVIGATION. — On the 18th inst., Lake Michigan was nearly clear of ice, and steamers had commenced their daily trips between Chicago and Milwaukie.

CHOLERA AT PERNAMBUCO.—A letter from Pernambuco, dated Third mo. 14th, states that the cholera was very prevalent there, over 2200 persons having died.

THE ELECTIC TELEGRAPH COMPANY, in England, sent across their wires 26,430 messages in the last six months of 1855, and paid a dividend of seven per cent. The Magnetic Telegraph, Morse's line, between New York and Washington, sent 404,000 messages during the last year, or nearly eleven times more business than the English telegraph, and made a much less dividend. The difference is in the cost of telegraphing, which is much less in this country than in England.

EXTRAORDINARY PRESERVATION.—On the 12th ult., the schooner Lightfoot, on her passage from Liverpool, N. S., to Barbadoes, was upset in a heavy gale, when every person on board perished, except Robert Harlow, the owner, who was lashed to the rail. The next day the schooner righted, and Harlow remained for five days without food or water, partly submerged, when he was rescued and taken to St. John, N. B.

THE SEARCH LAW OF VIRGINIA, which obliges every vessel to be examined before it leaves any port in that State, the search being at the expense of the vessel, is causing much dissatisfaction, and will interfere with the coasting trade to Virginia. The Alexandria Sentinel says that one of the coal and iron companies who have their depot in that city, and whose vessels are searched as they go out of the Potomac, intend to test the constitutionality of the new law, at the next term of the court.

READING RAILROAD.—The net profits of the business of this road, for the four months ending Fourth mo. 1s stated at $258,672, which is $222,451 less than in corresponding period last year. The falling off is a buted to the increased severity of the winter, which terfered greatly with the mining and transporting coal.

THE LOST STEAMER.—The ship Skiproips which sa from St. John's, Newfoundland, Second mo. 13th, on arrival at Figueria reported seeing fields of ice, ab 200 miles from the coast of Newfoundland, and a ste er's lights among the ice. The ship could not get enough to ascertain whether the lights seen belonge the Pacific, but it is supposed that must have been case.

RECEIPTS.

Received from Z. Hampton, Io., $2, to 10, vol. from R. Kearsley, Mich., $4, vols. 29 and 30; from W Foulke, agt., O., for Robt. Millhouse, $2, vol. 29, Eber Johnson, $2, to 32, vol. 29; from B. Winder, $2, vol. 29; from Ed. Healy, N. Y., $2, to 32, vol. from Jas. H. Dean, O., $1, to 26, vol. 29, for Jona. De H Gamble, A. M. Brantingham, $1 each, to 6, vol. from St. B. Smith, agt., for Jona. Briggs, $4, vols. 28 29, John M. Smith, Saml. Smith, senr., Robt. Hollow $2 each, vol. 29.

WEST-TOWN BOARDING SCHOOL.

The Summer Session of the School will commence Second-day, the 12th of the Fifth month.

The pupils will be conveyed by railroad to W Chester, where conveyances will be in waiting to t them and their baggage to the School, on the arrival the morning and afternoon cars on Second-day, the 12 and Third-day, the 13th of the Fifth month. The ba gage will arrive the next day. The cars leave the dep south side of Market street, above Eighteenth street, half past 7 o'clock, A. M., and at half past 4 o'clock, P. The agent of the School will be at the Railroad depot Second and Third-day afternoons, and will furnish pup with tickets, and accompany them to West Chest Those who go by the morning train, will be furnish with tickets by a person in attendance.

FALLS MONTHLY MEETING SCHOOL.

The Committee of the above named School is desire to procure a well qualified female teacher, to take char of the School as instructor, for the ensuing sea Early application is requested, and can be made by dressing, John B. Balderston, Fallsington, Bucks Coun Penna.

MARRIED, Third-day, 4th ult., at Friends' Meetin house, Sixth and Noble streets, BENJAMIN H. SHOEMAK to SUSAN B. TRUMP, daughter of Michael Trump, all this city.

——, at Friends' Meeting, Germantown, Phila on Fifth-day, the 17th inst., ABRAHAM M. UNDERHILL, Scipio, N. Y., to SARAH A. OGBORN, daughter of Fothe gill and Sarah Ogborn, of the former place.

DIED, on the 4th of the Fourth mo., 1856, at the re dence of her brother, Geo. Mickle, SIBYL PAUL, aged years: an esteemed member of Woodbury Monthly Me ing of Friends, N. Jersey. We think this language m be justly applied to our departed friend. "Blessed a the dead, which die in the Lord, from henceforth, ye saith the Spirit, that they may rest from their labour and their works do follow them."

——, at his residence in Chester county, on Secon day, the 7th inst., JOHN R. THOMAS, in his 75th yea a member of Uwchlan Monthly Meeting.

—— suddenly, on the night of the 10th inst., AS DILWORTH, of East Bradford, Chester county, Pa., ag about 58 years; a member of Birmingham Particul and Monthly Meeting. This dear Friend was mar attached to the doctrines and testimonies of our religio Society, and was concerned to live agreeably theret her humble, consistent walking having gained for h the sincere esteem and affection of her friends and ac quaintance. Though filling the station of a domesti she was diligent in the attendance of all our meeting both for worship and discipline, which, through th kindness of the family with whom she resided, she se dom missed; occasionally walking to meeting, a distanc of over two miles, when most convenient. On Fifth-da evening, she retired to rest, after the duties of the da were over, in apparent health, and was found the ne morning in her bed, a corpse! Having been concerne while in health, to keep her loins girded and her lam burning, her friends have the consoling belief that, suc den as was the midnight call, it found her ready to en ter with the Bridegroom into everlasting rest.

From the Quarterly Review.

Zoological Sketches.

(Continued from page 258.)

ie monkeys before they were transferred to house suffered a great mortality, and, indeed, aking possession of their new apartment, the ers used to remove the dead by the barrowful e morning. This extreme mortality was pro- d by want of ventilation and a system of heat- which burnt the air and induced inflammation ne lungs. Dr. Marshall Hall and Dr. Arnott, being consulted, directed the substitution of pen stove, when the deaths ceased.

s we pass towards the small building once used ie parrot-house, but now dedicated to the small- elidæ, we go by the seal-pond, and see that ge beast which resembles a Danish carriage- with his legs amputated. He is an epicure as rds his regular meals, and turns up his nose at fish less recherche than whiting, of which ex- ive delicacy he consumes ten pounds weight . Meanwhile, however, he is "a snapper-up nconsidered trifles," and we see him, as the ors circulate round his enclosure, flop, flop, nd the margin of his pond, keeping a sharp out above the railings for stray favours. The e of the smaller carnivora is generally over- ed, but it is worthy of a visit, if only to see the tiful clouded tigers as they are misnamed, for more resemble hunting leopards both in size skin-markings. These elegant creatures are e tame, and permit the utmost familiarities of keeper; but their neighbour, the caracal or , never seems tired of making the most fero- rushes at the bars, accompanied by a vindic- and incessant spitting, which impresses us with dea that it possesses the very quintessence of ike nature. There is one little cage in this tment which is deserving of especial inspection at containing a specimen of the indigenous k rat, which according to —— Waterton was ely eaten out of the country by the gray rats anover, which came over in the same ship with h William, and which are, according to that ty naturalist, the very emblems of "Protestant city." Those who have read his delightful ys know well with what perseverance the au- hunts the gray rodent through every chapter is book.

we now retrace our steps along the border of plantation, which forms a deep green back- nd for countless dahlias, and moreover screens garden from the biting east, we shall, by turn- ing to the right hand, come upon the Aquarium, the latest and most attractive sight in the gardens. How cool and delicious! Around us we perceive slices of the deep sea-bed and the rapid river. Were we mermen we could not examine more at case the rich pavement of the ocean set with strange and living flowers. In the midst of the green walls of water which surround us, mimic caves, waving with sea-weed and other marine plants, afford shelter and lurking-holes for bright fish which stare and dart, or for shambling crustaceæ which creep over the pebbly bottom. Against the dark verdure of these submerged rocks, the sea-anemone rears its orange base tipped with flower-like fans, or hangs its snake-like tentacles, writhing as the head-dress of Medusa. But we must look narrowly into each nook and under every stone, if we wish to realize the amount of animal life which here puts on such strange vegetable forms. Let us consider well for a few minutes one of the tanks running down the middle of the building. For months all the minute animal and vegetable life has been multiplying and decaying, and yet the water remains pure and bright. The explanation of this phenomenon affords one of the most beautiful examples of the manner in which nature on a grand scale holds the balance true between her powers. If we were to put these little bright-eyed fish alive into the crystal tank, in a week's time they would die, because they would have withdrawn all the oxygen it originally contained, and contaminated it with the poisonous carbonic acid gas exhaled from their lungs. To prevent this, the philosopher hangs these mimic caves with verdant sea-weed, and plants the bottom with graceful marine grasses. If the spectator looks narrowly at the latter, he finds them fringed with bright silver bells: these bells contain oxygen, which the plants have eliminated from their tissues under the action of light, having previously consumed the carbonic gas thrown out by the fishes and zoophytes. Thus plants and animals are indispensable to the preservation of each other's life. But even now we have not told the entire causes which produce the crystal clearness of the water. The vegetable element grows too fast, and, if left to itself, the sides of the tank would be covered with a confervoid growth, which would speedily obscure its inmates from our view. We want scavengers to clear away the superfluous vegetation, and we find them in the periwinkles which we see attached by their foot-stalk to the glass. These little mollusca do their work well: —— Gosse, who has watched them feeding with a pocket-glass, perceived that their saw-like tongues moved backwards and forwards with a crescentic motion, and thus, as the animal advances, he leaves a slight swath-like mark upon the glass, as the mower does upon the field. But it is clear that there are not enough labourers in the tank we are inspecting to accomplish their task, as the lobster, who comes straggling over the stones in such an ungainly manner, is more like a moving salad than any living thing, so thickly are back, tail, feelers, and claws, infested with a dense vegetable growth. A few more black mowers are imperatively called for. The fish, the weed, and the mollusc, having secured to us a clear view of the inhabitants of the tank, let us inspect them one by one. Here we see the parasitic anemone. Like the old man of the sea, it fixes itself upon some poor Sinbad in the shape of a whelk, and rides about at his ease in search of food. Another interesting variety of this zoophyte is the plumose sea-anemone, a more stay-at-home animal, who generally fixes himself upon a flat rock or an oyster-shell, and waits for the food to come to it, as your London housewife expects the butcher and baker to call in the morning.

The pure white body of the neighbouring actinia renders it more observable. Its tentacles, displayed in plumes over the central mouth, which is marked with yellow, give it the exact appearance of a chrysanthemum, and should be much in favour with the mermaids to adorn their hair. A still more extraordinary creature is the *Tabella ventilabrum*. The tube of this strange animal is perfectly straight, and its large brown silk-like radiating fans, whilst in search of food, revolve just as the old-fashioned whirling ventilators did in our windows. The instant this fan is touched it is retracted into the tube, the ends just appearing outside, and giving it the appearance of a camel's hair brush.

We shall not attempt to describe the different species of zoophytes and annelides, amounting to hundreds—indeed, they are not all familiar to scientific men. We have little more to say of the crustacea that go scrambling about, yet it would be impossible to overlook that peripatetic whelk-shell, which climbs about the stones with such marvellous activity. On a narrower inspection we perceive that it moves by a foreign agency. Those sprawling legs protruding from its mouth discover the hermit crab, which is obliged to dress its soft body in the first defensible armour it can pick up. A deserted whelk or common spiral shell is his favourite resort, but, like many bipeds, he has a love of changing his house; and those who have narrowly watched his habits state that he will deliberately turn over the empty shells upon the beach, and, after examining them carefully with his claws, pop his body out of one habitation into another, in order to obtain the best possible fit.

But there are still stranger facts connected with this intelligent little crustacean. We have before observed that the parasitic sea-anemone invariably fixes himself when possible upon this moveable house, perfectly regardless of the many bumps and rubs which necessarily fall to its lot. Another warm friend, the cloak-anemone, clings still closer, for it perfectly envelopes the lip of his shell with its living mantle. He has still a third intimate acquaintance, who sponges upon him for bed and board, in the shape of a beautiful worm *Nereis bilineata*, which stows itself behind the crab in the attic of the whelk-shell, and, the moment its protector by his motions indicates that he has procured food, glides between the two left-foot jaws, and drags a portion of the morsel from his mouth, the crab appearing to evince no more animosity at the seizure than the Quaker who suddenly finds his spoons taken for church-rates. The interesting specimens we have dwelt upon are confined to the sea-water tanks, which line the Aquarium on the side opposite the door, and those which run down the centre

of the apartment. Vis-a-vis are the fresh-water tanks, in which we may watch the habits of British fishes. There is a noble pike lying as still as a stone—a model sitter for the photographer who lately took his portrait. The barbel, bream, dace, and gudgeon are seen going about their daily duties as though they were at the bottom of the Thames, instead of sandwiched between two panes of glass, and inspected on either side by curious eyes. Those who go early in the morning will have a chance of seeing the lampreys hanging like leeches from the glass by their circular mouths, and breathing by the seven holes which run beside their pectoral fins. The marine fish should also be studied—strange forms with vicious looking jaws, the dog-fish for example, which is a young fry as yet, but which will grow a yard or two in length.

(To be continued.)

For "The Friend."

The Quakers have been a despised people from their rise, and though corporeal injury is not now inflicted, yet does not contempt for the plain unsophisticated Quaker, influence the feelings and sentiments of many? Are not simple, honest-hearted men held in low estimation, and even fixed dislike, because they cannot join in adopting and supporting divers innovations attempted to be thrust upon our religious Society? Has not pride risen to a great degree among some, who are courted and honoured by others, but who contemn some of the testimonies of the Society, and disregard and disuse them when it suits their inclination? In 1682, "Elizabeth Hill, being in a meeting at Broughton, was by the rude boys dragged out, and so abused that she was seemingly quite spent and near dead; and lying in the dirt, one of the boys, to try whether she was still alive, put his finger into her mouth, and perceiving her to breathe, said, 'Let us at her again. The devil is in her, and we will squeeze him out.' These cruel abuses made a neighbourly woman cry out, 'What, will you kill the woman?' To which the boys said, 'What care we? Mr. Cotton bid us do so.' 'Did he, indeed,' asked the woman. 'Aye, indeed,' replied the boys. 'Then,' said she, 'he may be ashamed of it.' Thus they openly said that it was William Cotton, the priest of the parish, who encouraged them to this wickedness; and his man said in plain terms his master was one of the best men in England; for if every one would serve them so, this heresy would be routed out. This man, Thomas Ambrose, did not stick to say, that nothing would drive the Quakers away, but fire or water; and if the house was his, meaning where they met together, he would burn it on their heads."—*Sewel*. It would be well for many who are free in the use of their tongues or their pens, to pause and inquire whether they are in the spirit of the true original Quakers, bringing them into sympathy with those who now deeply suffer on account of the attacks made upon the principles of Friends, and their organization, and the distracted condition of the Society everywhere, produced by the attempts to change ancient Quakerism. It is better to suffer with the despised people of God, than to glory with worldly men and women, who are soaring above the precious Truth in its purity and simplicity. It would be useful to our young Friends to peruse the history of the rise of their Society, and contemplate the favours which have been conferred upon them by the Head of the church, through the illuminations of his Holy Spirit, and the sufferings and faithfulness of a large body of servants and spiritual worshippers of the living God. To despise and lay waste the principles and testimonies of the gospel, for which they suffered deeply in publishing anew to slumbering carnal professors of the name of Christ, is like trampling on the blood and the ashes of the martyrs, and must draw down divine displeasure upon those who do so. A departure from purity of language, using flattering titles, and complimentary manners, will wound the tender conscience, and prepare the way for further violations of the divine law, and the eventual ascendency of the world's spirit and fashions, until the obligations and the life of religion may be wholly disregarded. We fall as well as rise by slow gradations.

From Chambers' Journal.

"Half a Second."

The pendulum swings to and fro, ticktack. If the length of rod is properly adjusted—at thirty-nine inches and a fraction—the time occupied in each swing is a space to which the appellation of a second has been applied. There is no natural abstract relationship between a second of time and thirty-nine and a fraction inches of length; the connection is purely accidental, not to say capricious. The rate of the pendulum is governed by the attraction of the earth; while the imperial standards of measurement assigning a fixed legal length to feet and inches, were lodged in the Tower ages before it was suspected that the earth possessed such a quality as attraction. It was mere caprice, again, for aught we know to the contrary, which decided that the day should consist of twenty-four hours, the hour of sixty minutes, and the minute of sixty seconds. However, by universal consent, it has been agreed that this sixtieth of the sixtieth of the twenty-fourth of a day should be accepted as the unit of time. Here, in fact, we stop; our ordinary thoughts and speech recognise no briefer interval. To "wait a moment," is the smallest conceivable draft upon our patience—

One moment seen, then gone for ever,

affords the strongest expression of evanescent duration whereof our language is susceptible. Nay, we use the same word even on occasions when it is unfit and hyperbolical: the flash of lightning, we say, lasts only for a second—the truth being that it does not last even for so long as the thousandth part of a second.

Long before mankind got bold enough to measure the lightning, they found objects for which it became desirable to ascertain intervals of time of half a second, the tenth, or even the hundredth of a second in duration. Some of these objects were simply curious, others possessed a high practical utility. In astronomy, for example, the most refined processes of calculation would be utterly wasted, if we could not insure a corresponding delicacy in the observations to which they are applied. It is useless to *compute* the tenths of a second, if we cannot *observe* the tenths of a second; otherwise, we should be like men attempting to adjust their accounts to a farthing, while the smallest change in their pockets is a dollar-bit. Thus, in ascertaining the longitude of places in the usual mode, by noting the passage of a star across the meridian wire of a telescope, an error or uncertainty of one second involves an error of a quarter of a mile in actual locality. Even if uncertain in our time by the tenth of a second, we are left also uncertain about our place to an extent of forty-four yards—which is something in an intricate navigation.

For many other classes of observation, a much severer degreee of delicacy even than this becomes necessary. But the human senses, however keen by nature or sharpened by exercise, fail to recognise intervals either of time or space beyond a certain point of minuteness; the natural organ must, therefore, be aided by instruments which extend the range of our perceptions, and helped still further by contrivances designed to shift and evade the chief difficulty in our way. By these devises, according to the nature of the result to be attained, time is changed into space, or space into time, or both numbered so as to derive the result from the particular phenomenon most readily seized and most delicately appreciated. The methods in which this object is brought about are often sufficiently curious.

Let us take an example from among the most important and interesting operations performed in an astronomical observatory. Suppose that a new planet has been discovered, and the astronomer royal wishes to compute its orbit. For this purpose he must note from day to day the precise instant at which the body passes the meridian. He places himself accordingly on the reclining couch of the observatory, with his eye to the glass of an equatorial, already adjusted so as to catch the celestial stranger in its field of view as he goes by. Near at hand is a clock beating time very distinctly, and furnished with a third index or pointer, travelling round the dial in every second, just as the minute hand does in an hour. A brass wire and catch are placed in such wise as to stop this seconds' index instantaneously, upon pressing a button placed conveniently to the observer's hand. Across the field of view in his telescope, is stretched a lattice of fine wires or cobweb threads, dividing the circle into minute squares, and indicating the centre in a conspicuous manner. Finally, an assistant takes his seat close by, with pen and paper, ready to note down the results. These preparations made, as the time approaches, the observer watches with breathless attention, silently counting the seconds until the planet enters his telescope, and becomes entangled in the mesh-work of cross-wires. The just as the sparkling point passes the centre, he touches the button; the catch falls, the second index of his clock is stopped, and the result is noted down in his journal with an accuracy which an expert astronomer will feel pretty certain may be trusted to the twentieth of a second. If newed observations enable him to correct or improve his first estimate. On this basis, he ultimately ventures to build his calculations; and in the next year's almanacs the world is informed that the new planet—and new planets have been turning up lately at the rate of two or three per annum—goes round the sun in so many days and hours, at so many miles distance, in an orbit of such and such declination and eccentricity; and the announcement will be found correct to a nicety.

Descending from the skies, we are met by scores of terrestrial problems, for which a still more minute accuracy is required in the solution. Fortunately, in these cases the facts to be observed are less remote, the instruments less unmanageable, and the ability to ascertain their indications with fitting delicacy correspondingly enhanced. Among the problems, there are none more curious and interesting than those which relate to the velocity of sound. Every one who has seen a gun fired at a distance, must have noticed that the flash precedes the report of its explosion, and have learned, therefore, that sound travels slower than light. Precisely the same result occurs in the case of the lightning and thunder-clap. But the question is—how much more slowly; or, otherwise, at what rate does sound really travel through the air?

The French government, many years ago, spent much money, and employed many men of high scientific repute in solving this query. All manner of facilities were placed at their disposal, and no expense or trouble spared. Among other things the savans were allowed to manœuvre a battery of field-artillery, and transport it to carefully selected localities, whence its fire could be most effectively

cted towards the pacific object in view—that
ct being to render the flash of the guns visible,
the reports audible, at the greatest attainable
nce. The philosophical artillerymen managed
ell, that many of their experiments were con-
ed with cannon fired at not less than nine miles'
nce from the spot at which they waited with
and ears open, and stop-watches in their hands
ote the result.

his result, after all, scarcely repaid the pains
cost devoted in obtaining it. Many sources of
rbance became gradually apparent, and spoiled
accuracy of their observation. Sometimes the
l was in the way, blowing with perverse irreg-
ity, throwing the sound back, or impelling it
ard in a most capricious manner. But the
f source of error lay in the imperfection of the
an senses. In all the experiments, there was
gree of surprise; that is to say, the flashes and
rts came more or less unawares. Now, with all
ible steadiness of attention and sharpness of ap-
ension on the part of the different observers, it
found impossible to make them agree in their
lts. The same interval between light and sound
computed by different persons at different
ths; and the consequent errors were found to
perfectly unavoidable and inextricable. Two
es, sight and hearing, were engaged in the pro-
of observation, and the issue varied according
heir respective quickness and delicacy. One
e was more acute in one man, and the other in
companion. One observer saw quicker than he
rd; another heard quicker than he saw. The
rval registered by these two, varied materially;
even the notes taken by the whole body of ob-
ers presented so many eccentricities, that their
putations of the velocity of sound could not be
d upon in the manner which had been expected
wished. Bessel, the astronomer, from his ex-
ence with an extensive staff of assistants, com-
d that the uncertainty arising from this cause
t amount to fully half a second.

Selected.

The Law of Kindness.

A volume entitled "Illustrations of the Law of
dness," by G. N. Montgomery, has been pub-
ed at Albany, in the State of New York. It is,
literary work, of little pretensions, but it pre-
s in one focus, a very considerable number of
edotes, exemplifying the superiority of the bene-
nt over the coercive and severe principle, as a
ns of effecting good ends amongst our fellow
tures; and such reasoning as the book contains
himated by all the earnestness of an amiable and
ting nature. The author classifies his facts into
pters, one of which presents scriptural instances,
a as that of David's conduct towards Saul in the
e; another, presents a brief account of the be-
olent proceedings of Howard, Oberlin, Fenelon,
; showing how the law of kindness tended in
r lives to the most brilliant results.

n the chapter on the disarming force of kind-
s, we have a story that never can be too often
. "It is well known that Quakers, or Friends
e adopted the non-resistance principle, or the
, overcome evil with good. The founder of
ladelphia, William Penn, was completely armed
a the spirit of this principle; when he visited this
ntry, he came without cannon or sword, and with
etermination to meet the Indians with truth and
dness. He bought their land and paid them;
made a treaty with them, and observed it; and
always treated them as men. As a specimen of
manner in which he met the Indians, the follow-
instance is very striking. There were some
fertile and excellent lands, which in 1698, Penn
ascertained were excluded from his first purchase;
and as he was very desirous of obtaining them, he
made the proposals to the Indians, that he would
buy those lands, if they were willing. They
returned for answer, that they had no desire to sell
the spot where their fathers were deposited; but to
please their father Onas, as they named Penn, they
said that he should have some of the lands. This
being decided, they concluded the bargain, that
Penn might have as much land as a young man
could travel round in one day, beginning at the
great river Cosquance, now Kensington, and end-
ing at the great river Kallapingo, now Bristol; and
as an equivalent they were to receive a certain
amount of English goods. Though this plan of
measuring the land was of their own selection, yet
they were greatly dissatisfied with it after it had
been tried; for the young Englishman chosen to
walk off the land, walked so fast, and so far, as
greatly to astonish and mortify them. The
Governor observed their dissatisfaction, and asked
the cause. 'The walker cheated us,' said the
Indians. 'Oh, how can that be?' said Penn,
'did you not choose yourselves to have the land
measured in this way?' 'True,' replied the Indians,
'but white brother make a big walk.' Some of
Penn's commissioners waxing warm, said the bar-
gain was a fair one, and insisted that the Indians
ought to abide by it, and if not, should be compel-
led to it. 'Compelled!' exclaimed Penn, 'how can
you compel them without bloodshed?' Then turn-
ing with a benignant smile to the Indians, he said,
'Well brothers, if you have given us too much land
for the goods first agreed to, how much more will
satisfy you?' This proposal gratified them, and
they mentioned the quantity of cloth and number
of fish-hooks, with which they would be satisfied.
These were cheerfully given; and the Indians shak-
ing hands with Penn, went away smiling. After
they were gone, the Governor, looking around on
his friends, exclaimed, 'O, how sweet and cheap a
thing is charity! Some of you spoke just now of
compelling these poor creatures to stick to their
bargain, that is in plain English, to fight, and kill
them, and all about a little piece of land!'

"For this conduct, manifested in all his actions
to the Indians, he was nobly rewarded. The un-
tamed savage of the forest became the warm friend
of the white stranger; towards Penn and his fol-
lowers they buried the war hatchet, and ever
evinced the strongest respect for them. And when
the colony of Pennsylvania was pressed for provi-
sions, and none could be obtained from other settle-
ments—which necessity arose from the increasing
number of inhabitants not having time to raise the
necessary food—the Indians cheerfully came for-
ward, and assisted the colony by the fruits of their
labours, in hunting. This kindness they practiced
with pleasure, because they considered it an accom-
modation to their good father Onas, and his friends;
and though Penn has long been dead, yet he is not
forgotten by the red men; for many of the Indians
possess a knowledge of his peaceable disposition,
and speak of him with a tone and feeling very dif-
ferent from what they manifest when speaking of
those whites who came with words of treachery on
their tongues, and kegs of fire-water in their hands,
and oppression in their actions.—*Ch. Citizen*, 1845.

The manufacture of Watch-cases.—This branch of the watch manufacture is carried on in this city to a greater extent, perhaps, than any other city in the Union. The movements of English, Swiss, and other watches are imported to this country, and the gold cases made here. In the manufacturing districts of Europe cases must be made of not less than eighteen carats, while in Switzerland a fine and imprisonment is inflicted for any infraction of this rule.

The principal firms engaged in this business in Philadelphia are Baker & Tracy, Harper & McLean, C. & C. P. Warner, Jacot & Brothers, Gigon, Lacot, and five others, all of whom employ over 300 hands. The competent journeymen among these make about $20 per week, so that the average amount paid out weekly will amount to between $7000 and $8000. This force will manufacture for the market over 500 cases per week, which cost from $20 to $90 each, or an average of about $40, making the entire results of one week's operation of some $20,000, or over $1,000,000 annually. The business, it will be seen, requires a large capital, as the material and labour must be paid for in cash, and often the finished work is sold upon credit.

The gold used in most of the establishments is the native California gold. This gold contains more or less silver and iridium; the latter being a hard metal it is necessary to remove it and other impurities before working the gold. This is done by dissolving it in nitro-muriatic acid, which, when filtered through paper, prepared for the purpose, removes all foreign substances. The gold is then called, technically, *fine*, and now it is ready to receive the alloy necessary to give it the degree of fineness and *karat* required. The gold, without this process of alloying, would be entirely too soft, and therefore silver or copper is generally used, the one hardening while the other improves the colour of the pure gold, and gives a rich shade to it. The next process is to melt it and cast it into bars of sizes to suit the work designed to be made. These bars are rolled between two steel rollers, driven in some of the establishments by steam, and reduced to the requisite thickness and width, for cutting out the cases, when it is given to the case-makers, in whose hands the movements to be cased are placed. The flat pieces are rounded and shaped with swedge boxes, and when completed are given into the hands of the "letter-in," who fits in the movement and attaches it to the case by a joint. It is then placed into the hands of the "springer" who makes and fits the steel spring for throwing up the backs; when this is completed the case is given to the "polisher," who, on a lathe driven by steam or hand, prepares it for the engraver by producing a perfectly smooth and glossed surface; the engraver, with the aid of a complicated piece of machinery termed an "engine turner," produces upon the back, landscapes, figures and other decorations, to suit his or his employer's fancy. After this the finisher takes it in hand and pins up the joints, adjusts the ring or bow, and completes the work with the exception of polishing—thus the case passes through seven distinct hands. The gold manufactured into cases weekly, will not amount to much less than $14,000, or over a half-million of dollars annually.—*Ledger.*

For "The Friend."

Amid the loud outcry constantly made by blinded and interested slaveholders, of their entire satisfaction with the "peculiar institution" existing among them, and their determination to resist every effort to emancipate our country from its continued and extending influence, it is cheering to find that they do not speak the sentiments of all whom they assume to represent, and that sentiments of a very different character are cherished by not a few of the citizens of some of the Slave States. In illustration of this we give the following extract from the "Springfield Republican."

Anti-Slavery in the Slave States.—It is a noteworthy fact, that the only daily journal in Kentucky, out of Louisville, is an open anti-slavery

sheet, as much so as the Republican, and an avowed supporter of the Republican party. It is the Newport *Daily News*, conducted by Wm. S. Bailey, an earnest and honest man. It publishes a call for a popular Republican meeting for Madison County, Ky., for the choice of delegates to the republican national convention at Philadelphia. The call says: "A large meeting is anticipated. Able speakers from the slave-cursed soil of Kentucky will address the meeting." And the *News*, greeting the call, talks thus "right out in meeting:"

"Madison county, in this state, has taken the lead; is the first to proclaim to the world that slavery has enemies, and that no small proportion of them are at work in its very midst and among its worshippers. This is as it should be! Heretofore, with the exception of a few of the noble minds, who had a love of justice that knew no fear, men have not dared to speak, against the accursed institution, in words above a whisper; for, with the overbearing tyrannical spirit which has always characterized it, mobs and brute force have been its only arguments. The time has at last come, however, when reason, together with the broad stream of enlightenment, have overcome the more uncharitable; and some of those who have been the most zealous advocates of slavery and its accompanying wrongs, are now its most bitter opponents. We hope to see a large meeting; a coming together of men who know their rights, and the rights of fellow-men, and knowing, dare maintain them. The ball has been started, and our wish is, that it may never cease to roll until the Presidential chair is filled by one who will ever preserve, pure and unsullied, the principles of the republican party!"

This, with the open avowal of anti-slavery sentiments, and their reception with applause at a late political meeting in Loudon county, Va., and the movements in St. Louis, for a branch of the republican organization, are facts of encouraging and marked significance. There is a large party, in all the southern states, and particularly in those bordering on the free, ready to join a united North in putting a stop to the growth of slavery. A strong conservative element, like this, only wants justification and encouragement in the action of parties in the free states to develope its power, which, it cannot be doubted, will prove adequate to restrain the fanatical ultraism of a portion of the South from the mischief they threaten, if slavery is restricted by Congress.

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 260.)

EDWARD REESE.

Edward Reese was born in Wales, and was convinced of the Truth, in his native country. About the year 1682, he removed to Pennsylvania, and settled within the limits of Haverford Meeting. He received a gift in the ministry, which he exercised in the Welsh language. His communications were well received, and he was in unity with Friends, being much employed in his own meeting. He was frequently representative to the Quarterly and Yearly Meetings, so that he must have understood the English language. He paid a religious visit, in 1721 and 1722, to Wales, from meetings in which he brought "good certificates," on his return, of his services among them.

His decease took place, Sixth mo. 28th, 1728, and he was buried at Merion.

MERIBAH SLOKAM.

Meribah Slokam resided at Shrewsbury, where she died in the Eighth month, 1728. Her friends say, she was "in the station of an elder, was concerned for the promotion of piety and virtue for many years, a kind assistant to the poor, and in good unity with Friends in general."

JOHN HAINES.

Of this Friend, the husband of Esther Haines, of whom a short memorial has been given, his testimony says he was "an appointed elder, and a zealous man." He deceased "about the year 1728." His residence was at Evesham.

MARGARET LIPPINCOTT,

An elder of Shrewsbury "in good repute and esteem," deceased in the Ninth month, 1728.

LEWIS WALKER.

This Friend, who is spoken of as a "worthy elder," belonged to Haverford Monthly Meeting, but his farm was in the valley. "He had a meeting at his house for several years, and was instrumental in settling a meeting there. He gave a lot of ground to the use of Friends of that meeting, where the meeting-house is built. He lived in love and unity with his friends." He died on the 23d of the Tenth month, 1728, and was buried at Friends' burying-ground in the valley.

MARY CADWALLADER.

Mary Cadwallader, the wife of John Cadwallader, of Horsham, the first minister of that name in Pennsylvania, was a woman suitably qualified to feel with and for her husband in his many religious engagements, and to superintend his outward concerns during his travels, in the service of the gospel. She was in the station of an elder. Her friends say, "She was inoffensive in life and conversation, and discreet and careful in the management of her husband's affairs, when he was abroad in Truth's service." She deceased Eleventh mo. 8th, 1728, aged nearly 50 years.

WILLIAM EVANS.

William Evans, of Evesham, whose wife, Elizabeth, was an acceptable minister of the gospel, was an elder, "whose house and heart were open to Friends. He was a man of a noble spirit." He departed this life, about the Twelfth month, 1728.

JOHN DUNKIN.

John Dunkin, of Byberry, who deceased the last day of the year 1728, in the 61st year of his age, was an elder and a "useful member of the Society."

DENNIS CONRAD.

Dennis Conrad or Cunrad, as the name was often spelled in early times, was born at Cresheim, in Germany, where he was convinced of the principles of Truth, by William Ames, in or about the year 1657. He came among the first Germans to Pennsylvania, and settled at Germantown, where the first meetings for worship of Friends were held at his house. He was esteemed in religious Society, and often employed in its affairs. "He was," says T. Chalkley, "a man of an inoffensive life, much given to hospitality, and left a good report behind him." He lived to a great age, dying about the close of the Ninth month, 1729. The meeting, held at the time of his death, was large, many of the early settlers of that part of Pennsylvania attending it.

CATHARINE MILLER.

Catharine, a daughter of our valuable Frie Thomas Lightfoot, was married, in Ireland, to Jan Miller. She was called to the work of the m nistry, and was well approved therein. In the y 1729, she, with her husband, came to Pennsylvan with an intention to make it their residence. Th reached Philadelphia, about the 10th day of Ninth month, bringing a certificate from the me ing they had belonged to in Ireland, of its un with them, and of her godly conversation and m nistry. Remaining in Philadelphia, she was gaged in her Master's work, very much to the sa faction of Friends for the ensuing four weeks, the close of which, on the 7th of the Tenth mon she was taken ill. On the 17th, she departed t life, and on the 19th, after "a good meeting" at "great meeting-house," she was buried "in a dec and exemplary manner." The Friends of Phi delphia say of her, "Though her time was short among us, yet by her appearance in the nistry, and sweet conversation, she manifested h self a servant of Christ, with whom we had g unity, and doubt not but she is entered the r prepared for the righteous."

WILLIAM COLESTON AND JOHN SOTCHER.

Of William Coleston, of Gwinnedd Monti Meeting, and of John Sotcher, of the Falls Monti Meeting, both esteemed valuable elders in th day, we find little trace, except the evidence forded by the minutes of the different meetings, their dedication and faithfulness to their appoi ments. They both deceased in the Eleventh mon 1729.

Corrections.—It appears from evidence dis vered since the account of Caleb Pusey was p pared, that the "Indian alarm," in which he t such a prominent part, took place in 1689, not 1688, as suggested by Proud. It would seem t the alarm was equally prevalent in Maryland, as Pennsylvania at that time among the Protestar who believed that the Indians were instigated the Catholics.

In the account of Elizabeth Webb, I have f lowed Smith's History of Friends of Pennsylvan &c., as to the time of her death. I have since fou that her death did not take place for one year, af the time stated, say 1727.

(To be continued.)

Glazing of Sheet-iron with Glass.—A corresp dent of the Scientific American gives the Pa process for protecting sheet and wrought iron means of a thin coat of glass. The articles first to be scoured bright, and washed with dil acid, then dried and brushed over with a solut of gum arabic. The glass is then dusted o them by means of a sieve. The ware is next dr in an oven heated to 300 degrees, then put i another oven, where it is brought to a bright heat, until the glass is in a melted state, whic ascertained through suitable openings in the furna After this it is taken out and put in a clo chamber, to prevent sudden cooling. If necessa a second coat is to be put on in the same mann The glazing is composed of 130 parts of flint gl 20½ parts of carbonate of soda, and 12 parts of racic acid, carefully mixed and melted in a gl house pot. This glass, after casting and cooli is pulverized under a steel pestle, and sifted thro a bolting-cloth; it is then fit for use. This cover for iron is transparent, and does not scale off, split by the action of heat, and it resists sud changes of temperature. Acids, even concentra

l hot, do not act in a notable manner on the
n coated with this composition. On the other
nd, boiling solutions of caustic potash or soda seem
lissolve small portions of the silica and boracic acid.
nong the manifold applications of this process, is
very useful one to cooking implements, as a
ostitute to tinned ware; its advantages are cleanli-
ss and absence of metallic taste in food. Stove
pe is by this means kept from rusting. Among
latest applications is the coating of pots for
gar refineries, crystalizing vats for fatty acids
d other articles of sheet iron. It can be applied
the cast-iron plates used in candle stock presses,
se plates and presses being liable to rust and
in the fatty matters.

Selected.

SHE IS GONE.

She is gone," they say of my gentle child,
With heart so loving, with looks so mild,
With ways that my wintry hours would cheer,
And a smile that was sunshine all the year.

From life's spring morning, from childhood's play,
From years on whose flight no burden lay,
From hopes whose promise was fair and new,
She is gone, they say; but it is not true.

There are those that go from our hopes and cares,
Which follow the wanderer still in prayers,
Through sin's dark places, through time's rough sea:
My child hath not gone like these from me.

My hearth hath indeed a vacant place;
I miss the light of a pleasant face,
That blithely welcomed my comings in
From the long day's toil, and the city's din.

And ever some weary thought will go
To her grave in the church-yard green and low,
Where they laid the dear of my home to rest;
But not the angel I love the best.

For safe where no spoilers reach the store,
My Saviour keepeth one treasure more;
Not gone from memory, not gone from love,
But gone to our Father's house above.

Selected.

CONSCIENCE.

Thy heart keeps knocking all the day,
What does it mean, what does it say?
Thy heart keeps knocking all the night,
Child, hast thou thought of this aright?
So long has it knocked, now loud, now low,
Hast asked what it means, by knocking so?
My child, 'tis a lively little bell,
The dear God's gift who loves thee well,
In the door of thy soul, by him 'twas hung
And by his hand it still is rung,
And he stands without to wait and see
Whether within he shall welcome be,
And stands without and hopes to win
The welcome answer, "Come in, come in."
So knocks the heart, now day by day,
But at night the last stroke will die away,
And when its knockings on earth are o'er,
It will knock itself at heaven's door,
And stand without and wait to see
Whether within it shall welcome be,
And stand without and hope to win
The Father's welcome, "Come in, come in."

Translated from the German.

Selected.

GENTLE WORDS.

Use gentle words, for who can tell
The blessings they impart?
How oft they fall (as manna fell)
On some nigh fainting heart!

In lonely wilds by light-winged birds
Rare seeds have oft been sown;
And hope has sprung from gentle words,
Where only griefs had grown.

Never esteem any man, or thyself, the more for money; nor think the meaner of thyself or another for want of it; virtue being the just reason of respecting, and the want of it, of slighting any one.

Epistle of George Fox.

Being now a prisoner in Lancaster Castle, a deep sense came upon me of a day of sore trial and exercise, that was come and coming upon all who had been in high profession of religion; and I was moved to give forth the following paper as a warning to such:—

"Now is the day that every one's faith and love to God and Christ will be tried; they who are redeemed out of the earth, and they who are in the earth, will be manifested; and who is the master they serve, and whether they will run to the mountains to cover them. Now will it appear who are the stony ground, who are the thorny ground, and who are the high-way ground, in whom the fowls of the air take away the seed; and the thorns and cares of the world choke, and the heat of the persecution scorches and burns up your green blade; for the day trieth all things. Therefore let not such as forsake truth, for saving the earth, say that your brother priest only serveth not the Lord Jesus Christ, but, his own belly, and mindeth earthly things, for such themselves also do the same, and hug and embrace self, and not the Lord. Now it will be made manifested, who is every one's God, Christ and Saviour, and their love will be manifest, whether it be of the world or of God; for if it be the love of the world, it is enmity, and the enmity will manifest itself what it is, and the day will try every spirit and its fruits. Therefore my dear friends, in the everlasting Seed of God live, that is over all the house of Adam and his works in the fall; and so dwelling in the Seed, Christ, that never fell, in him you all have virtue, life, and peace, and through him ye will overcome all that is in the fall." 1664.

G. F.

From The Leisure Hour.

Visit to a Spanish Olive Farm.

In a lively book of travel and adventure along the "Bridle Roads of Spain," from the pen of G. J. Cayley, who recently visited the country in search of health and recreation, is a brief description of an olive farm and olive-oil manufactory, which may interest some of our readers. The establishment, situated a few miles from Seville, belonged to the Marques de Castilleja, who personally accompanied our tourist on his visit, and kindly entertained him at his country-house. They together left Seville, attired for the occasion in the Andalusian costume, and after passing dark-green orange groves interspersed with the still darker cypress, and following a track lined with wild olives, with here and there the aloe lifting its gigantic spikes above them, the travellers came upon the bushy *dehesa*, or wilderness. Having pursued this region for a time, the dehesa, says Cayley, changed to olive-groves, and we got into mazy private roads which wound among the trees. At last, after about three hours and a half on the road, we came in sight of a long low mass of white building, with a pinnacle-mounted gateway, through which we passed, amid the greetings of a motley crowd of retainers, into a vast court-yard, around which were the establishments for grinding the olives and storing the oil, besides stables and dwellings for the retainers. Here, leaving the red and yellow calesa in which we had journeyed, we went through an iron gate into a *patio* with a fountain and marble arches and columns. The house was a curious rambling arrangement of corridors and passages, and galleries hung with quaint old family portraits in wigs and brocade, and likenesses of the kings of Judah, signalized with their respective names in yellow paint.

Having inspected the house, and lunched, each of us now armed himself with a polished yew club, which appears to be the legitimate companion of predial inspection, and sallied forth. This stick (called *porro*) is about five or six feet long, often forked at the smaller end, and is held a little above the middle with the heavy knob on the ground, so that when you walk it swings between its planting-places like a pendulum. The one the marquis used was a sort of hereditary rural sceptre, which had descended to him from the hands of his father and grandfather, and very likely from their fathers and grandfathers to them.

We first went to see the olive-mill. In form it very much resembles a chocolate-mill; a huge wheel of granite, shaped like the thick end of a cane, rolls round a piece of timber on which it is pivoted, being drawn by a mule yoked to a crooked beam. This beam, jutting from the central timber, bends over the wheel, receiving half way the other end of its axle. On the opposite side of the central timber—which is also pivoted in the stone crushing-floor and a beam of the roof—there is a wooden funnel full of olives. This keeps slowly laying down the plump purple berries, which the roller, as it comes round, keeps crushing with a fat crackling sound, not unlike that which proceeds from the basting of meat, only on a larger scale. The pulp, as it accumulates, is shovelled off and placed in layers between round mats under the press. These mats are about six feet in diameter, and have a hole in the middle. When there is a sufficient pile of pulp and mat sandwiches, the whole is wetted with hot water, and the press—an immense lever about forty feet long—comes down upon it, being lifted at the other end by a screw, with spokes like a capstan. The oil, of course, floats on the surface of the water, and is run off into tanks.

Having seen how the oil was made, we went out to see how the olives were gathered, accompanied by Ramoncillo, the gamekeeper—a strange, lurching vagabond who squinted at right angles, and had all his arms and legs of different lengths. After wandering some time among the devious paths of the olive-grove, we found the little colony of gatherers; for colony it seemed, being composed of men, women, and children, down to the smallest possible dimensions. The babies, who had usually a very little girl to take care of them—unless they were slung up in a *manta* out of the way among their metaphorical brotherhood of olive branches—sprawled and babbled around head-quarters.

Here, by a purple mountain of spoil, stood the general of the little army, who, in all directions, were waging war with the trees of peace, besieging them with scaling-ladders and belabouring them with long staves. The women were on their knees underneath, picking up the bright little berries as they rained from the beaten boughs. I tasted an olive, though I was aware it was not likely to be good. Let the reader imagine a rotten morel cherry soaked in oil, and he will not be far from having an idea of a ripe olive, except that there is a bitter, astringent after-taste, which sticks in the throat and prickles on the tongue for some time. The green olives, which we eat in their pickled state, are no more like the ripe, than pickled walnuts are like the walnuts of dessert.

When any of the women had filled their baskets, they came with them on their heads to the purple mountain aforesaid, and discharged their gatherings upon the heap. If there was much leaf and rubbish mixed with the fruit, the woman tilted up her basket behind and let a slender stream of olives fall from above her forehead, while a man with a flapping sack winnowed away the lighter matters. Over the heap stood guard the steward, or *capataz*,

an ancient man, with a grizzy stubble on his chin (for it was Saturday,) standing with his legs apart, broadly planted in the dignity of his office. The straddling supporters of this weight of importance were encased in what seemed in front to be a pair of brown sheepskin breeches, but from behind revealed themselves to be but a slit apron fastened with thongs round each leg. Both his hands were on his hips, with each thumb hooked in the folds of his faja, and in the fingers of his right was a crooked whittle, with which, ever and anon, as the basketfuls arrived, he would nick the score upon notch-sticks which hung in a curve of string between two branches of olive hard by. These sticks were regular tallies. Each basket had a couple of loops, in which the gatherer's stick rested, and when the basket was discharged, the bearer presented it to the capataz. He, fitting it on to its brother on the line, nicked them both with his eagle-beaked blade.

The sun went down, and we returned to the farm. We found the olive mills still working, lighted by flaring wicks, in iron saucers, of its own oil. We next re-entered the house, where, at the end of one of the galleries, a great wood fire was burning on the hearth. Here we wiled away the time till supper, which, though bespoken at nine, made its appearance at eight; for in Spain meals, as well as all other arrangements, are ruled more by a general approximation to the fitness of things than by any precise hours. The supper comprised *gazpacho* and salad, and *eggs* fried in oil, with a little cold chicken and ham to eke out. We then retired to our blazing fireside, which flared with a brillant white flame, from the oily offal of the olive-press which had been thrown on to it; and soon afterwards retired to bed.

A man, like a watch, is to be valued for his going. He that prefers him upon other accounts, bows to an idol.

THE FRIEND.

FIFTH MONTH 3, 1856.

PHILADELPHIA YEARLY MEETING.

The meeting convened on Second-day morning, the 21st ult., at ten o'clock, the meeting of ministers and elders having been held as usual on Seventh-day, the 19th ult. It was, we think, somewhat larger than it has been for several years past. Upon calling the names of the representatives, they were all present, except two, one of whom was said to be absent on account of indisposition. Portions of the reports from the respective Quarters having been read, two minutes for ministers in attendance, one from Indiana, and the other from Ohio Yearly Meeting, were read, together with those for their companions.

The clerk informed the meeting there were on the table epistles from all the Yearly Meetings with which this meeting has of latter time corresponded, and proposed they should now be read. A Friend, objecting to the reception of epistles from all of those meetings that had opened a correspondence with the meeting in Ohio represented by J. Binns, the whole subject was thrown open for discussion, and considerable contrariety of sentiment was at first apparent. Those uniting with the last named meeting, advocated the reading of all the epistles, but that from the Yearly Meeting of Ohio with which Philadelphia Yearly Meeting had last year declared itself to be in unity, alleging that if the meeting persisted in the conclusion come to last year, it would be cut off from the Society of Friends, and the rights of membership be affected. Some other Friends thought that as there were two separate bodies, within the limits of both New York and Baltimore, each claiming to be the Yearly Meeting, the epistles received from the Yearly Meetings convening in the cities of New York and Baltimore, should not be read, but the question be left open. After some time spent on the subject, the judgment of the meeting was clearly manifested to be to read all the epistles on the table, except that from Baltimore, the further consideration of which was postponed to a future sitting. The epistles from New York, North Carolina, Ohio, Indiana, [both for 1854 and 1855,] Dublin and London, were then read, after which the meeting adjourned until 4 o'clock. After the opening minute of the afternoon session had been read, a Friend reported on behalf of the representatives, that they had conferred together, and the way did not open to make any change at the present time; another of the representatives informed the meeting, that although both the clerk and assistant clerk were very desirous to be released from further service, yet as the way did not open among the representatives to comply with their wishes, they proposed William Evans for clerk, and Samuel Hilles for assistant, which, being approved by the meeting, they were appointed to the respective stations.

The meeting again took up the consideration of the reading of the epistle from Baltimore, and the sentiments advanced on the subject in the morning sitting, were again brought forward, and dwelt upon at more length, occupying a considerable portion of time, but eliciting nothing new. The meeting was favoured with a good degree of calmness and quiet throughout, no excitement being manifested, and it was finally concluded to pass on, without reading the epistle. The London General Epistle was then read, and a committee appointed to draft essays of epistles to other Yearly Meetings, as way should open for it.

On Third-day morning, the 22d, the meeting being opened as usual, it had brought before it an appeal from Caln Quarter, and a committee was appointed thereon with direction to report to a future sitting. Some Friends now appeared very desirous that the document issued by London Yearly Meeting on the separation in Ohio, should be read, and the subject be thus brought again before the meeting; but as it was the time always heretofore devoted to the consideration of the state of the subordinate meetings and members, by the reading of the queries and answers, it was decided not to deviate from the usual order. The subjects brought before the meeting during the progress of the investigation, were solidly considered, and a lively interest manifested that the deficiencies apparent might be remedied, and Friends incited to a more faithful performance of duty in the maintenance of all the testimonies of Truth; the clerk was requested to prepare a minute, embodying the exercise which had prevailed in the meeting.

A committee was appointed to examine and settle the Treasurer's account for the past year, and to propose the sum to be raised for the use of the meeting during the present year. Then adjourned.

The proceedings of the Meeting for Sufferings during the past year, were laid before the meeting by the reading of its minutes; they were approved, and the desire expressed that that meeting would continue to be vigilant in the performance of its duty, and embrace every opportunity that may present to fulfil the objects for which it is appointed.

The report of the Book Committee contained in these minutes, was particularly interesting, showing the care taken to keep up a supply of the writings of Friends, approved by the society; and a very considerable increase in the numbers sold or gratuitously distributed. We hope to be able to obta the report for publication in a future number.

The minutes of the Meeting for Sufferings i formed, that E. Greenfield (not a member of o religious Society,) had by a deed of trust, directe that an annuity of $100 should be paid forever t the Treasurer of the Yearly Meeting for the tim bee; but the estate, since her death, having bee involved in litigation, that meeting had appointe a committee to investigate the circumstances, an on its report, recommended that the Yearly Meetin do not accept the annuity, which being approvec two Friends were appointed to draw up a suitabl minute on the subject.

A memorial from Burlington Monthly Meetin respecting our friend Stephen Grelett was read an directed to be recorded: the meeting then adjournec

Fourth-day morning, 23d.—The printed docu ment on the separation in Ohio, forwarded b London Yearly Meeting, as part of its correspon dence, was now read, occupying a great portion o the sittting, after which an aged Friend offered t the meeting some impressive remarks on the subjec of separations in our religious Society, referring t those which had occurred within it at differen times since its rise,—the great loss always sustaine by those who persisted in taking part in them,—th difficulties in which they had involved the Society,— the testimony borne by the apostle against those whic took place in the primitive church, and likewise b George Fox against the spirit of separation mani fested in his day—saying he could fully unite wit the sentiments respecting separations which we ha just heard read, but regretted that notwithstandin their correctness, London Yearly Meeting had give its sanction to separation. After some further obser vations from other members the meeting adjourned

Afternoon.—A proposition was made to send th document from London into the Women's Meetin which called forth some discussion, but it was finall concluded not to do so. The annual report of the com mittee having the oversight of West-town Boardin School was read, giving the meeting full informatio of the manner in which the institution had been con ducted during the past year, its present condition, an the various important improvements effected. Th report contained two propositions, one to allow th superintendent to receive boys as pupils, over th age of fifteen and a half years, [within which ag they have heretofore been restricted]; and the other to give the committee power to raise the charge fo board and tuition to ninety dollars per annum, i in their judgment it may appear to be expedient Both of these propositions were united with, it bein also agreed that the superintendent should hav authority to discharge any scholar over the abov mentioned age whose conduct should be such as t render his stay prejudicial to the school. Th report was satisfactory and the committee encou raged to persevere in their efforts to carry out th concern of the Yearly Meeting in the establishmen of the seminary.

An interesting report from the committee charge with the care of that portion of Indian natives whos civilization and religious improvement have so lon claimed the concern of Philadelphia Yearly Meet ing was also read. It represented the Boardin School established on the reservation at Tunessassa about two years ago, to be in successful operation there being seventeen of the Indian boys and girl residing in the family and participating in the ad vantages of the school as well as in those arisin from correct social and religious training. As th committee find it necessary that the funds at thei disposal should be increased, in order to carry ou the improved system of education now pursued, th meeting recommended, opening voluntary subscrip

s among the members in aid of the pecuniary
ans required to sustain this interesting work, and
ouraged the members to contribute liberally.
The committee appointed on the Appeal from
n Quarter made report, reversing the judgment
he Monthly and Quarterly Meetings, which being
ted with, two Friends were appointed to give the
pellant information of the decision come to.
journed.

Fifth day afternoon, the 24th.—The meeting met
suant to adjournment. The Friends appointed
a former sitting to prepare a minute in the neces-
y form for releasing the trustees of the estate of
zabeth Greenfield, from the payment of the
nuity bequeathed by her to this Yearly Meeting,
duced one adapted to the circumstances of the
e, which was read and adopted.

The Quarters having forwarded in their reports,
ounts of the result of the inquiries among their
mbers respecting the habitual or occasional use
spirituous liquors as a drink, or furnishing it to
ir workmen, they were read, and seventy-five
es were found to be reported; seventeen of
ich use the article habitually, and fifty-four oc-
ionally, nine have given it at times to those em-
yed by them. One of the Quarters, (a small
e) reported all its members clear. It appeared
t labour had been bestowed on some of those
ending in this matter; the subject took hold on
feelings of the meeting, and it being thought
t considerable advance had been made within a
y years in putting a stop to this pernicious indul-
nce, the subject was again recommended to the
ious attention of the subordinate meetings, and
y, encouraged to labour earnestly in a proper
rit to persuade all who may use spirituous liquors
a drink either frequently or occasionally, to
andon it entirely; reports to be forwarded as
retofore, next year.

The Quarters reported thirteen hundred and fifty
ldren of a suitable age to go to school, disposed
as follows: at Select Schools taught by members,
5. At mixed schools taught by members, 377.
West-Town Boarding School, 228. In schools
select nor kept by members, 115. At Haver-
d, 10. At the Public or District Schools, 263.
family schools, 165. Temporarily absent, 44;
d five have not been receiving any education at
ool during the past year. The value of a
igiously guarded education was impressed on the
eting, and the subordinate meetings and members
couraged to make what efforts may be in their
wer, to carry out the long cherished concern of
e Yearly Meeting, to secure to the children of all
members the benefits of a sound literary educa-
n under the care of teachers in membership, and
otected from the evils of corrupting associations.
ne Quarters were desired to forward reports on
isinteresting subject in the usual manner, next year.
The report of the committee appointed to settle
e Treasurer's account, &c., was read and adopted.
Three Friends were appointed in conjunction with
e Treasurer, to apply some means for preventing
e meeting from being incommoded by the noise of
e street.

The committee appointed to aid the Friends of
orrewsbury and Rahway Quarter, reported that
me of their members had attended each Quarterly
eeting as it occurred during the past year. The
ommittee was continued, and at their suggestion
ree Friends were added to it. Then adjourned.

Sixth day, the 25th.—After the opening minutes
ad been read, the clerk informed the meeting that
letter addressed to the Yearly Meeting had been
id on the table, and asked the direction of the
eeting respecting it. As it was an unusual circum-
ance, there was at first a diversity of sentiment, some thinking it ought to be referred to a committee for examination, to report as to its fitness to come before the meeting, while others wished the clerk to say whether it was such a communication as ought to claim the attention of the meeting. Upon the clerk reading the clause of the Discipline relative to papers addressed to the Yearly Meeting, it was at once given in charge to four Friends, who left the meeting to examine it. On their return, they reported as the prevailing sense of the committee that the paper should not be read, which was approved.

Essays of epistles addressed to New York, North Carolina, Ohio, Indiana, London and Dublin, having been prepared by the committee, they were now read, and a discussion at once ensued as to the propriety of forwarding any, or a part of them. Those Friends who have all along manifested opposition to the action of the Yearly Meeting in recognizing the meeting of which B. Hoyle is clerk, as Ohio Yearly Meeting, protested against sending the epistle now addressed to it, and preferred that no epistles should be issued by the meeting this year; although the great fear expressed by them heretofore had been, that by the ceasing of correspondence with other Yearly Meetings, Philadelphia Yearly meeting would be cut off from the Society. The subject was presented in various aspects, but upon no former occasion do we recollect a more general and decided expression of unity with the contents of the epistles and their being forwarded as usual.

After the clerk had made the minute directing the epistles to be signed by him on behalf of the meeting and forwarded in time, the same Friend who last year desired those who united with him in opposition to the action of the meeting, to stop at its rise made a similar proposition, which was acceded to by those in unison with him, after which the meeting settled into a solemn quiet, when the clerk read the concluding minutes, and the meeting closed.

The argument most constantly urged by those Friends who objected to the action of Philadelphia Yearly Meeting in relation to that of Ohio, was, that by continuing to acknowledge fellowship with it, after other Yearly Meetings have united with the body of which J. Binns is clerk, we shall be cut off from the great body of the Society, and that Philadelphia Yearly Meeting ought to take no step in relation to this subject contrary to the wishes of those of its members who so highly value their connection with the other Yearly Meetings, that rather than have that connection endangered or destroyed, they would prefer separation from their own Yearly Meeting.

But they appear to forget that a question involving the principles this does, is not to be decided upon the supposition of absolute power in a majority of Yearly Meetings; nor do they seem to bear in mind that the judgment come to in the case, by Philadelphia Yearly Meeting, both last year and this, is evidently from a conscientious conviction on the part of a very large proportion of its members, that the separation of those who appointed J. Binns for their clerk, is subversive of the order and discipline of the Society, and rests on errors, which if carried out must finally destroy its organization. It must therefore be presumed that Philadelphia Yearly Meeting feels religiously bound to bear its testimony against the violation of order and proper subordination committed by those who separated, and it could hardly be expected to desert the cause for which it has been so long suffering, and to act so inconsistently as to cast off, in their time of deep trial, the large Yearly Meeting of Ohio, which has been long standing side by side with it in the maintenance of a testimony against the dissemination of unsound doctrines, and against a disregard of the discipline and usages of our religious Society.

Many Friends seem to think it a matter not calling for any consideration, that the thousands of men, women, and children composing Ohio Yearly Meeting, embracing as large a proportion of honest-hearted consistent members of the Society, as any other Yearly Meeting of equal size, should be repudiated by all their brethern in profession with them, although it is to be supposed that those of them who are of age to estimate their right of membership, value it as highly as any others do, are as deserving as any others of having those rights universally recognized, and feel as keenly as others, the withholding of those rights by other Yearly Meetings. Notwithstanding that neither unsoundness of doctrine, nor disregard for the testimonies held by the Society, can be justly laid to their charge, the hearts of many would seem to be so closed against them, because of their conscientious difference of opinion, that they have no regard for their rights as members, but would, if they could, cut them off in a body; and they allow themselves to speak of them as if they were no better than offenders who had been justly disowned.

It has been one of the remarkable features in the controversy now agitating the Society, that from its commencement in this country, those who have been labouring to maintain the purity of our doctrines, and inviolability of our principles of church government, have been invariably treated by their brethern who differed from them, as though they were actuated by unworthy motives, and their conscientious scruples and religious concern, are spoken of as so evidently the result of ignorance or prejudice, as to be unworthy of any deference or serious consideration. Such has been the course pursued towards the Yearly Meeting of Philadelphia and Ohio, and towards those members in other Meetings uniting with them. We cannot bring ourselves to believe that this is right, or that it is calculated to put an end to dissension and difficulty, nor can we reconcile this unwillingness to meet the religious scruples of Friends on their merits, with that frankness and christian regard which becomes brethren of the same household of faith, nor with the desire so often expressed that all cause of offence should be removed, and the Society once more become united.

Out of the Divine protection and merciful regard, no part of the Society, however small, can be excluded by their fellow professors, and we trust that the afflictions of the present day will draw all those who are truly concerned for the promotion of the truth, nearer to Him, and increase the fervour of their petitions for a growth and establishment therein.

We understand that those Friends who stopped at the close of the Yearly Meeting, after remaining together for some time, adjourned until the next morning, when on reassembling they decided to take no further step; a conclusion at which we rejoice, being persuaded there is no cause for their separating from their brethren with whom they now mingle in religious and social intercourse, and that such a step would not only break up that intercourse, but be greatly prejudicial to the best interest of themselves and their children, and only increase the difficulties already pressing so heavily on the Society.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 12th ult. The British steam frigates sent in search of the missing steamship Pacific, had returned without discovering any trace of the vessel.

The Treaty of Peace, is said, unofficially, to contain the following stipulations:—The neutralization of the Black Sea; Russia, not to keep there more than ten ships of

war armed; for the defence of her coasts. Nicholaieff, to be reduced to a merchant port, with an engagement that no ships of war shall be constructed beyond the number agreed to as above. Russia is to allow Consuls from all the Powers in the ports of the Black Sea and the Baltic. The fortifications of Bomarsund are not to be reconstructed. Russia cedes part of the territory of Bessarabia, comprising the fortress of Ismail, and renounces the exclusive protectorate of the Danubian Principalities. Russia also renounces the protectorate of the Greeks in the Ottoman Empire. The free navigation of the Danube is guaranteed to all the States without exception.

The Congress continued its sessions, and was said to be engaged in considering the political state of Italy, which subject had been brought before it by the Sardinian Representative. A journal of the proceedings of the Congress will be published.

RUSSIA.—The Czar has issued an ukase, stating that the fleets hitherto maintained by Russia in the Black Sea and Sea of Azoff, are not to be restored. The prohibition of the export of Russian produce has been repealed. Many vessels laden with grain, lying at Odessa, had received orders to proceed to Marseilles.

FRANCE.—The army is to be reduced from 600,000 to 400,000 men. Expeditions against Madagascar and the Kabyles are decided upon. Permission will be sought to send troops through Egypt to the former, and the latter will serve as a cause of the Emperor's visit to Algeria, although he will not himself command the army.

DENMARK.—Advices from Copenhagen state that the English Cabinet have officially notified to the Danish government their refusal to agree to the capitalization of the Sound-Dues, and the determination of Great Britain to admit other and more acceptable propositions. Russia and Oldenburg set the example a few weeks since. The question of the settlement makes no progress, and will probably stand over till it is seen what action the United States will take.

TURKEY.—The Turkish government expresses anxiety to be relieved of the presence of the Allies, and says it is quite able to maintain internal order and the defence of its frontier without the aid of foreign troops. Lord Stratford de Redcliffe will continue as British Minister at Constantinople. Omar Pacha has been restored to favour, and resumes the command of the army in Anatolea.

GREAT BRITAIN.—A British order in Council raises the blockade of all the Russian ports, and permits the free resumption of commerce in all articles. The grand Naval Review by Queen Victoria, of all the ships that can be collected is postponed till the 22d or 23d ult., by which time the treaty of peace will be ratified. Steamers are being fitted up to bring the army home from the Crimea.

Liverpool Market.—The sales of cotton for the week reached 70,000 bales; prices had slightly advanced. Breadstuffs were dull and declining. Flour had fallen 1s. per barrel.

London Money Market.—The bullion in the Bank of England had decreased £432,000. There was a large speculative demand for money. Consols, 93¾.

INDIA.—Great dissatisfaction exists among the natives of Oude, in consequence of the annexation of that kingdom to the British possessions. The King threatens to visit England, and lay his complaints in person before the throne.

NICARAGUA.—The remnant of Schlessinger's forces had arrived at Rivas. They sustained a loss of 90 men by the attack of the Costa Ricans. Walker's army was said to occupy a good position, and to be daily receiving accessions. He was in good spirits, and confident of success.

MEXICO.—Dates from the city of Mexico to the 19th ult., and from Vera Cruz to the 22d, have been received. The church property at Puebla, which had been declared confiscated, on account of the active part taken by the priests in the late rebellion, was seized by the military, the Bishop refusing to surrender the same. It is said that the Archbishop of Mexico had offered General Comonfort $600,000 to have the decree revoked, but the proposition was not accepted. Communication with the capital was open from all parts, and the country in a peaceful condition.

UNITED STATES.—The proceedings in Congress have been mostly unimportant. Among the amendments to the deficiency appropriation bill adopted by both houses, is one appropriating $30,000 for the purchase of seeds and cuttings for distribution throughout the country, through the patent-office. In the House of Representatives, the Committee on Commerce, reported about fifty river and harbour bills, and bills for Post-office and Custom-house purposes at Perth Amboy, Toledo, Ogdensburg and Cleveland, which were referred to the Committee of the Whole on the State of the Union.

Pennsylvania.—The Legislature of the State adjourned on the 23d. Six hundred and seventy-one bills and fourteen resolutions were passed at the recent session, and signed by the Governor. Among them was a bill relative to libels, allowing the truth to be given in evidence, and one restoring the charter of the Erie and North East Railroad Company.

Philadelphia.—Mortality last week, 189.

New York.—Mortality last week, 372. The shipments of specie for the week amounted to $300,265. On the 26th ult., sales of red wheat were made at $1.60; white, $1.75; corn, 60 cts. a 62½ cts.

The Sugar Crop.—According to Champromier's annual statement, the sugar crop of Louisiana for 1855, yielded 231,427 hogsheads estimated at 254,569,000 pounds. The crop of 1854 amounted to 346,635 hogsheads. The prospects of the sugar culture for the present year, are said to be unfavourable. The sugar crop of Texas last year reached nearly ten millions of pounds; in 1854, it was only seven and a half millions.

Miscellaneous.—The Iron Trade. Great Britain last year manufactured 3,585,906 tons of iron, valued at $125,000,000. This product was achieved by 238,000 men and 2120 steam engines, of 242,000 horse power. The annual production of the world is not greater than 7,000,000 of tons, the United States being next to England, the greatest producer, giving about a million of tons.

The Great West.—The steam navigation of the Mississippi and its tributaries consists of 787 boats, of an aggregate tonnage of 180,061, being an increase of 20 per cent. in boats, and 40 per cent. in tonnage, over 1855.

Civilization of Indians in Texas.—Major Neighbors, the Texas Indian agent, says that the Indians of Texas on the reserve, about twelve or fifteen hundred in number, are taking hold of farming with a determination to depend entirely upon it for support. Even the Southern Camanches have taken hold of the hoe, and are wielding it patiently.

The Mississippi Bridged.—The great railroad bridge across the Mississippi, at Rock Island, Illinois, is at length completed, and trains cross regularly between the Illinois and Iowa shores. There is a draw resting upon a centre pier which, when open, leaves a space of 127 feet over the main channel. The cost of the bridge is $300,000.

Shipwreck.—The Spanish steamship Mino, of Barcelona, was sunk off Tariffa on the 29th of Third month, in consequence of coming in collision with another vessel. There were 115 persons on board, only 21 of whom were saved.

Cultivating the Pine.—On the sunny shores of Cape Cod, Mass., the seed of the white or Weymouth pine is planted in hills, like corn, in soil which will produce nothing else.

The London Times and its Advertising.—The advertising columns of the Times are estimated to yield the establishment the enormous sum of $3,000,000 per annum. One firm alone pays the Times as high as $150,000 a year for advertising, and there are several business establishments that pay it over $50,000 a year for advertising alone.

The Course of the Late Tornado.—The course of the late tornado is thus followed by the Pittsburg Gazette:—It planted on Lake Michigan, its course was from the southern end of that Lake to Philadelphia, east-south east. It does not seem to have partaken of the nature of a tornado, until it arrived at about the middle of Ohio. Between Akron and Canton it swept away powerful forest trees as if they had been rotten saplings. It was about seven hours in accomplishing one-third of its journey; the other two-thirds of its course was accomplished in five hours, as it passed from New Jersey into the ocean about 10 o'clock, P. M. From the time it partook of the character of a tornado, it travelled at about the rate of 70 miles an hour."

Value of Manufactures in Massachusetts.—According to the statistics recently published, the annual manufactures of Boston and its vicinity, and other principal towns of Massachusetts, reaches the enormous amount of three hundred millions of dollars, or one million for every working day in the year.

Forged Land Warrants.—The amount of forged land warrants already discovered, exceeds one million of acres. The investigation is still in progress, and new frauds are daily coming to light.

Canal across the Isthmus of Suez.—In Alexandria, the sum of 15,000,000 francs was subscribed for this work in two days, by 250 persons of various nations. The Viceroy subscribed 30,000,000 in addition, and also 1,000,000 for the officers, and 1,000,000 for the soldiers of his army. At Cairo 50 persons subscribed 1,900,000 francs.

RECEIPTS.

Received from Aaron Sharpless, Pa., $2, vol. 29; fr David Heston, jr., Md., $6, vols. 29, 30 and 31.

"SELECTIONS FROM THE POETS."

A Second enlarged Edition of this Book has late been published. It contains about twice as much m ter as the first edition. It is for sale by the Friend w has charge of Friend's Book Store, 84 Arch st.

THE ANNUAL MONITOR FOR 1856.

This obituary of the members of the Society of Frien in Great Britain and Ireland for the past year, has j been received, and is for sale by Jno. Richardson, N 50 North Fourth st. Price, 37½ cents for single copi or $4 per dozen.

Philadelphia, Fifth mo. 1856.

WEST-TOWN BOARDING SCHOOL.

The Summer Session of the School will commence Second-day, the 12th of the Fifth month.

The pupils will be conveyed by railroad to We Chester, where conveyances will be in waiting to ta them and their baggage to the School, on the arrival the morning and afternoon cars on Second-day, the 12t and Third-day, the 13th of the Fifth month. The ba gage will arrive the next day. The cars leave the depo south side of Market street, above Eighteenth street half past 7 o'clock, A. M., and at half past 4 o'clock, P. The agent of the School will be at the Railroad depot Second and Third-day afternoons, and will furnish pupi with tickets, and accompany them to West Chest Those who go by the morning train, will be furnish with tickets by a person in attendance.

FALLS MONTHLY MEETING SCHOOL.

The Committee of the above named School is desiro to procure a well qualified female teacher, to take char of the School as instructor, for the ensuing seaso Early application is requested, and can be made by a dressing, John B. Balderston, Fallsington, Bucks Count Penna.

HAVERFORD SCHOOL ASSOCIATION.

The Stated Annual Meeting of the Haverford Scho Association, will be held at Committee-room, Arch stree Meeting-house, on Second-day afternoon, at 4 o'clock Fifth month 12th, 1856. Charles Ellis, Sec'y.

FRIENDS' BOARDING-SCHOOL FOR CHILDREN, AT TUNESSASSAH.

A man Friend is wanted to aid in carrying out th concern for the improvement to the Indians.

Application may be made to Joseph Elkinton, 377 S. Second stree Thomas Evans, 180 Arch street.

Philad., Eleventh mo. 1st., 1855.

Married, on Third-day, the 8th ult., at Friends' Meet ing-house, N. Sixth street, Elton Thomas, of Burlingto N. J., and Elizabeth Matlack, of this city.

Died, at LeRaysville, Jefferson Co., New York, th 22nd of Eighth mo. last, Susan, wife of James Child, i the 29th year of her age. She had a lingering illnes which she bore with christian patience; and her friend have the consoling belief that her end was peace.

——, on the 7th of First mo., at his residence, i Jefferson Co., New York, William C. Burdick, an es teemed member and elder, of LeRay Monthly Meeting in the 49th year of his age.

——, in Baltimore, on the 21st of Fourth month, i the 33rd year of her age, Mary, wife of George A. War der, and daughter of Joseph King, Jr.

——, Third mo. 26th, 1856, at her residence at Had donfield, New Jersey, in the 77th year of her age, Han nah Alexander, an esteemed member of Haddonfield Monthly Meeting. Although this dear Friend was fo many weeks much afflicted by severe bodily distress yet her friends are consoled with the comfortable assu rance, that she has entered into those mansions where all is rest and peace.

——, on the 23d ult., in the 85th year of her age Lydia Jones, widow of Samuel Jones, of Birmingham Chester county, and mother of the late Mary B. Sharp less.

Zoological Sketches.

(Continued from page 266.)

he council has scarcely established the Aqua- two years, and already it is well stocked with mens of British zoophytes and annelides, for nost part dredged from the neighbourhood of mouth. If these are so beautiful, what must he wonders of the deep sea in tropical climates? knows what strange things a bold adventurer t pick up, who, like Schiller's diver, would trate the horrid depths of the whirlpool, not for ewelled cup of the monarch, but for the hidden g treasures nature has planted there? Doubt- among the rusty anchors and weed-clung ribs ng-lost armadas, there nestle gigantic zoophytes enormous star-fish, which would make the for- of the Gardens in a single season.

t the northern extremity of the path we have following we come upon the paddock and pool cated to cranes and storks. What spectre birds we got among? See yonder, on the very of the pool, the gaunt adjutant, his head ed up in his shoulders, looking like some tra- r attempting to keep his nose warm in the east . They say every man has his likeness among ower animals, and we have seen plenty of ad- nts waiting on a winter's night for the last bus. What an elegant gentleman seems the ley crane beside him! There is as much differ- between the two as between a young guardsman ll dress at the opera and the night cabman hud- up in the multitudinous capes of his great coat. third claimant for our admiration steps for- l like a dancing-master, now bending low, now the aid of his wings lifting himself on the light astic toe, now advancing, now poussetting, and he time calling attention to his grotesque but altogether inelegant attitudes by a peculiar cry. defy the gravest spectator to watch the beauti- rowned crane at his antics without laughing. we hear the lady beside us exclaiming,—"Is ssible that the Maraboo feathers which so often efully sway in obeisance before the Queen, ever portions of such ugly birds as these?" kely as it may seem, it is verily from these y ill-favoured looking Maraboo storks that this ionable plumage is procured. Close by, sitting n a stone, we see the melancholy-looking heron, the audacious sparrows hop within a foot of egs, so inanimate he seems. Ah! it is the vile it of the bird: in an instant he has stricken intruder with his bill, and the next he has disappeared down his throat. That elegant gray crane is the "native companion" from Australia, so called from his love of consorting with man in that country. We all know what familiars cranes and storks are in Holland and in the East, where they build on the chimney-pots without the slightest fear, and we are glad to find that they possess the same confidence in the savages of the New World. They are handsome birds, but not so richly plumed as the European crane, with his black and white feathers and full-clustered tail. Once these cranes were common here, when "England was merrie England"—that is, before windmills and steam-engines were set to work to rescue many counties from a state of marsh. With civilization they utterly disappeared from the land, and with civilization we once more find them amongst us—a sight to gaze at. Not long since the odd population of this paddock embraced a secretary-bird, whose velvet breeches, light stockings, and reserved air, gave him an official appearance worthy of Somerset House in the last century. Take, care, little girl, how you feed them; a charge with fixed bayonets is scarcely more formidable than the rush of sharp long bills through the railings which immediately follows a display of provisions.

A few steps take us to the magnificent aviary, 170 feet in length, constructed in 1851, through the 19 divisions of which a pure stream of water is constantly flowing, and the space enclosed by iron netting is so spacious that the birds have room freely to use their wings. The first compartment contains two of the rarities of the Gardens—the satin bower-bird and the Tallagulla or brush-turkey. The former, a bird of a shining blue-black colour, is the only remaining one of three brought to this country in 1849. Immediately upon their arriving in the Gardens they commenced the construction of one of their bowers or "runs," which, according to Mitchell, has been constantly added to and re-arranged from that period to the present time. The bower is perhaps one of the most extraordinary things in bird-architecture, as it is constructed not for the useful purpose of containing the young, but purely as a playing place—a decorated ball-room, in fact, wherein the young couple flirt and make love previous to entering upon connubial life. The bower is constructed, in the present instance, from the twigs of an old besom, in the shape of a horse-shoe, or perhaps we should convey a better idea of it by stating that the sticks are bent into a shape like the ribs of a man-of-war, the top being open, and the length varying from six to twelve inches. Against the sides and at the entrance of the bower, the bird, in a state of nature, places bright feathers, snail-shells, bleached bones, anything, in fact, containing colour. When it is remembered that Australia is the very paradise of parrots and gaudy-plumaged birds, it will be seen that the little artist cannot lack materials to satisfy his taste for ornament; nevertheless, we are told that he goes for a considerable distance for some of his decorations.

When the structure is completed he sits in it to entice the female, fully aware, no doubt, that the fair are attracted by a handsome establishment. Be that as it may, the couple speedily commence running in and out of it, with as much sense, and probably with as much enjoyment, as light-heeled bipeds perform a galop. At the present moment, however, the male bird, bereft of his companions, seems careless of his bower, which is in a most forlorn condition—a ball-room, in fact, a day after a fete. May a new companion speedily arrive and induce him to put his house once more in order! The satin bower-bird, like the magpie, is well-known by the natives to be a terrible thief; and they always search his abode for any object they may have lost. "I myself," says Gould, in his account of these birds, "found at the entrance of one of them a small neatly-worked stone tomahawk of an inch and a half in length, together with some slips of blue cotton rags, which the birds had doubtless picked up at a deserted encampment of the natives."

Scarcely a less interesting bird is the brush-turkey. In appearance it is very like the common black turkey, but is not quite so large; the extraordinary manner in which its eggs are hatched constitutes its singularity. It makes no nest, in the usual acceptation of the term, but scratches decayed vegetable matter into a pyramid with its feet. It then carefully dibbles in its eggs at regular intervals, with the small end downward, and covers them over with the warm fermenting gatherings. The pair in the Gardens, shortly after they were received from Australia, commenced making one of these hatching-mounds, which, by the time it was finished, contained upwards of four cart-loads of leaves and other vegetable matter. After the female had deposited sixteen eggs, each measuring not less than four inches in length—an enormous size, considering the bulk of the bird—the male began to keep watch over this natural Eccaleobion, and every now and then scratched away the rubbish to inspect them. After six weeks of burial, the eggs, in succession, and without any warning, gave up their chicks—not feeble, but full-fledged and strong: an intelligent keeper told us that he had seen one fly up out of the ground at least five feet high. At night the chicks scraped holes for themselves, and lying down therein, were covered over by the old birds, and thus remained until morning. The extraordinary strength of the newly-hatched bird is accounted for by the size of the shell, which contains sufficient nutriment to nourish it until it is lusty. Unfortunately all the young but one have perished through various accidents quite independently of temperature; and the next brood will probably be reared. As both the flesh and the eggs of these birds are delicious, Mitchell is anxious to naturalize them among us. In fact, one of the objects of the Gardens under the enlightened management of the Secretary is to make it what Bacon calls, in his "Atlantis," "a tryal place for beasts and fishes." For centuries a system of extermination has been adopted towards many indigenous animals; the wolf and buzzard have quite disappeared, and the eagle is fast being swept away even from the Highlands of Scotland—so rapidly, indeed, that Gordon Cumming is anxious, we hear, for the formation of a society for the protection of its eggs. Noxious animals have been replaced by the acclimatization of many of the foreign fauna, which are either distinguished for their beauty or valuable for their flesh. This trans-

fer, which adds so much to the richness of the country, can be vastly accelerated through the agency of these Gardens, which are a kind of "tryal ground" for beasts, as the fields of some of our rich agriculturists are for foreign roots and grasses, in which those likely to be of service can be discovered, and afterwards distributed throughout the land.

(To be continued.)

Epistle of George Fox.

I wrote also another epistle to Friends, to warn them to keep out of the spirit that wrought in John Perrot and his company, against the truth,—

"Dear Friends,—Dwell in the love of God, and in his righteousness; that will preserve you above all changeable spirits, that dwell not in the Truth, but in quarrels. Avoid such, and keep your habitations in the truth. Dwell in the truth, and in the Word of God, by which ye are reconciled to him. Keep your meetings in the name of Jesus Christ, who never fell; then ye will see over all the gatherings of Adam's sons and daughters, you being met in the life over them all, in which are your unity, peace and fellowship with God, and one with another, in the life, in which ye may enjoy God's presence among you. So remember me to all Friends in the everlasting Seed of God. The fellowship of all those that are got into fellowship in outward things, will corrupt and wither away. Therefore live in the gospel, the power of God, which was before the devil was. This fellowship in the gospel, the power of God, is a mystery to all the fellowships of the world. So look over all outward sufferings, and look at the Lord, and the Lamb, who is the first and the last, the Amen; in whom farewell." 1664. G. F.

For "The Friend."

We think that the farmers in our country miss of both pleasure and profit by neglecting to give some little portion of their time to the introduction and cultivation of other sources of human food than the products of the field. We therefore offer for "The Friend" the following extracts taken from Allen's "Rural Architecture," published in New York, as suggestive of a construction easily effected and very ornamental, but which is seldom met with in our country.

Fish-Ponds.—Wherever water in sufficient quantity can be introduced by a side-cut from a stream, by damming the stream itself or by drawing it from a large spring, and the face of the ground in the vicinity of the house can afford a suitable place, either by enclosing a natural hollow or ravine by a dam, or by excavation, a fish-pond is well worthy the attention of a country resident, even if he be but a small farmer. As an ornamental feature of the place, it is of the most agreeable character; its utility will be unquestioned. The size of the pond is immaterial, beyond half an acre in area,—less it should not be—and if it embrace even twenty, thirty, or fifty acres, provided the proprietor can afford to devote so much land to that object, it will be all the better for the fish, both in numbers and in quality.

The depth of water may vary—no matter how deep—but the deepest part should not be less than ten feet, that there may be a cool retreat for the fish in summer, and a warm resting-place in winter; and if a depth to that extent can be made close to the margin on a part of the boundary, it will be all the better, as the fish may then enjoy the overhanging shade of the bank. The shore should be undulating if possible; irregular in its outline, and a part of it shaded by trees and shrubery, as fish love shade as well as sunshine. A part of the shore should be shallow, and shelve off gradually into the deep water, and if partly grown up with rushes, or lying on a smooth, clean sand or gravel, it will accommodate the different varieties of fish to bed and spawn upon; some preferring the shady and muddy bottom of the rush beds, and others the pebbly, clear and sunny floor of the pond for that object. The temperature of the water will vary, according to its depth and proximity to the shore, from ten to twenty degrees at any given time, thus affording accommodation to different varieties of the fish which may inhabit it in the various conditions of breeding, growth, and feeding, as they are enabled to treat themselves in their natural haunts in wild waters.

According to the clearness, temperature and purity of the water, will depend the selection of the kinds of fish which are to inhabit it. If the soil forming the bed of the pond be light, and clean, and stony, and the water be let in from a spring, or a spring brook of a low temperature, the Speckled Trout, and the cold-water fishes which are found in the same natural waters with them, may be introduced. Yet for trout the water should have some current. They are a playful and active fish, and nothing delights them more than the bubbling water of a spring, or the rapid shooting of a stream over a rugged bed.—Still in cool and clear water, a pond will satisfy them if the circulation be such as to avoid stagnation. The trout, too, love a deep hole, under a shaded bank, by the side of a projecting rock, or beneath the roots of a huge tree. There the larger ones love to gather, and from such haunts are the finest specimens to be drawn with the hook. They love to spawn in clear eddies, in sunny spots, over a stony or sandy bed, where their young fry can feed upon the animaleulæ and insects which play about the margin.

The Yellow Perch, a beautiful and delicious fish, may also be introduced into clear and cool water. It is quick and active in its movements, bites readily at the hook, and is exceedingly prolific. In the spring and summer season it loves to lie among rushes on the margin of a gentle-flowing stream or a still pond, when it spawns and breeds. The perch will thrive in water too warm and sluggish for the trout, but like the trout it loves to retreat and hide itself under a bank in the deep shadow during the day.

The Yellow Carp (the gold fish,) is a beautiful creature to throw into the pond. They are not a fish of prey upon its fellow, but live chiefly on insects and worms. They may be domesticated like the perch, and fed from the hand, and called by a bell to their accustomed feeding places in the pond. When turned out at large, their progeny will change into silver and brown varieties of color, while some of them will retain the deep orange of the originals. On the whole they are a beautiful and interesting fish, and should always be introduced into the pond.

In dark waters, resting on an oozy or muddy bottom, the European Carp is a capital and appropriate fish for propagation. It feeds like the yellow carp, chiefly on water worms, and has a "sucker" mouth, and grows to the weight of five, ten or twelve pounds.

The Mullett is also a good fish and of equal size to the carp, and when the waters are cold, of the finest flavour for the table. In warm weather, its flesh is apt to become soft and flavourless. The mullet also takes its food by suction. It is a fish of exceeding beauty, having large scales of most brilliant varying shades of silver, purple and yellow, which give it an uncommon richness in appearance. These "sucker-mouthed" fish do not take the hook like the trout, the perch, or the bass, but may be caught by the net, or spear, as they lie in the shallow water near the shore, either in the day-time, o torchlight at night.

The Silver Eel may also be put into the mu bottom pond, but when confined, they make havoc with the other fish, as well as with y ducks or goslings, if they are permitted to swi it. Although a migratory fish, they will remai confined waters, but they have too many disag able qualities in their social relations to be the c panions of the better fish that we have named.

In all waters where edible fish are kept, sm varieties should be introduced, as the Chub, Sun Fish or Roach, the Dace, the Shiner, the Sh and the Minnow; they are prolific in breeding, furnish abundant food for the Bass, the Trout, the Perch, which fatten upon them. The larg these yield the finest of sport to the children, their pin hooks and thread lines if they hav better. They are a nice pan fish also, tating multitude of their little bones; but fried to a c they are seldom in the way.

In ponds of sufficient extent, fish may be and propagated to profit, aside from supplying family with so great a luxury in food as fresh are usually esteemed. They may be fed with offal meats of the slaughter-house or the farm with balls of flour or meal, boiled or baked. T may be called to a particular point of the pon feed at regular hours, if they become accustome it. Such extra feeding will give them an ea and increased growth, and having less need to upon the smaller fish, the stock of course wil largely increased.

The feeding and care of fish will also be a so of pleasure and amusement to the members of family; and while away many an hour of leisu idleness that might otherwise tempt away the you ones to resorts of dissipation or vice. In s aside from its useful objects, we would have fish-pond, as we would the dove-cote or the rabb to give pleasure and variety to the farm, an cluster around it all the endearments with w life in the country should be surrounded.

To give the fish-pond its most ornamental feat as an object of interest or beauty, it should be tially clothed with trees and shrubs. In tre would select the soft or water maples, the will the water, or black ash, the birch, and the low poplar. In the way of shrubbery, the black a the wild rose, and the osier willow, make a be ful fringe to a water margin. A certain expre of wildness should be given to the pond, where of any size, and if it have some hidden nooks recesses difficult to approach from the shore, it be all the better. Fish love seclusion. Indee pond haunted on every side by the foot of ma the tread of animals, is but an indifferent spo their welfare, and the more it can resemble, in ward appearance and keeping, the wild wate the river, the lake or the natural pond, the congenial will it be to the tastes and habits of fish, and of course more profitable to the propri

It is scarcely necessary to add that the p should have an outlet of sufficient capacity to le its surplus water, and be thoroughly secured ag accident in bursting away, as an occurrence of kind might in a few hours, destroy the labour solicitude of years.

Avoid company where it is not profitable or n sary, and on those occasions speak little and Silence is wisdom where speaking is folly, and al safe. Some are so thoughtless as to interrupt anticipate those that speak, instead of hearing thinking before they answer; which is uncivi well as silly. If thou thinkest twice before speakest once, thou wilt speak twice the better f

For "The Friend."

William Dewsbury.

William Dewsbury was among the first Friends, like George Fox, was convinced, without incidental means, of the fallen condition of unregenerate man, the necessity of being brought out of order to be a partaker of communion with and that this change can only be effected by baptism of the Holy Spirit, which, like fire, consumes the corruptions of the heart, and sanctifies it a temple for the Lord to dwell in. He was at Allenthorpe, a village near Pocklington, the East Riding of Yorkshire, early in the 17th century; it would seem by calculations of his age his marriage, to have been about 1621. His acts appear to have been religious persons; and doubt were instrumental in cherishing that susbility of mind, which formed at an early age ding feature in his character. His father died the son was only eight years old; but prone flection as he was, and not too young to be ble of the loss he had thus sustained, the imion did not pass off so quickly as is usual with ren. For while, he was lamenting with tears the solemn and affecting event, he heard what ared to him a voice, which said, "Weep for lf, for thy father is well." So powerful was ffect produced on his mind by this extraordiincident, that from that time forward he spent hours, which in childhood are usually de to play, in prayer and fasting, under a sense s lost and undone condition.

is not one of the least remarkable particulars e life of William Dewsbury, as was also the with other early Friends, that almost in his infancy, he was thus by a power not his own, t his own command, made deeply sensible of epravity of our fallen estate. As he advanced ears, he became increasingly sensible of the pt propensities of his nature; and this was his amnation, that he lived without the knowledge e fear of God; and after many years' refleche had to lament the transactions even of his ish days, although there is no reason to appre he exceeded the ordinary levity of young peror in his conduct went at all beyond what is nonly tended innocent at his age. In this ner he was given to see the indispensable ne y of that change of heart, which in due time, elding obedience to the further manifestations vine light and grace upon his mind, was fully ght about to his inexpressible joy; and which r the gospel is denominated, a being born again ncorruptible seed, by the Word of God, which n and abideth for ever."

a tract which he wrote in 1655, while in hampton jail, to clear the truth from lies laid speaking of his condition before he had exnced a change of heart, he says, "In that state d, delighting in pride and pleasure, in lightand vanity as all do who are in that nature, I was about eight years of age. Even before time, the light in my conscience did witness ist me, and caused some trouble in me. But parted from the light, and followed the counsel y own heart, which led me into vanity, and to without the fear of God. About the time I ight years of age, the word of the Lord came e,—'I created thee for my glory—an account must give me for all thy words and actions done e body :' which word enlightened my heart, and ed in me the book of conscience, wherein was en all that I had done ever since I had had remembrance. When I had read my condihow I had lived without God, who had created r his glory, the word of the Lord came unto me, hall the axe boast itself against him that heweth therewith, or shall the saw magnify itself against him that shaketh it? As if the staff should shake itself against him that lifteth it up, or the staff lift up itself as if it were no wood?" And by the power of the word of the Lord that spake in me, my understanding was enlightened, and my conscience bore witness that such was my condition. I had lifted up myself against the living God, in living without his fear, who created me to live in obedience to him; I, on the contrary, had lived in disobedience until that day. Whereupon deep sorrow seized on me, and I knew not what to do, to get acquaintance with the God of my life."

These divine intimations and convictions were made upon his mind between the ages of eight and thirteen; by which was exemplified the Scripture truth, that it is sin which has made separation between man and his Creator; and also that the grace of God begins to bring him under condemnation for it, at times, without the intervention of human aid, at quite an early period of life. Under these powerful impressions, William Dewsbury endeavoured to alter his course. He ceased from what he was now led to consider his vain conversation in which he had hitherto lived, and became thoughtful and serious, far beyond his years. He began to read the Holy Scriptures, and other books on religious subjects from his own choice, and at the same time to mourn and pray to God, although, as his account states, he had received no clear understanding as to where He was to be found. It is evident, however, that the mind of this youth, under the quickening and heart searching operation of divine grace, was wonderfully opened to the sight of his spiritual condition. With David, his soul was athirst for God, for the living God, and his cry in effect was, "When shall I come and appear before God?" It was in vain that he availed himself of opportunities of learning through the public teachers of religion and other outward means, what he was anxious to know and to enjoy in himself. If his mind had been prepared for the reception of such knowledge, the outward and carnal views of that class of persons, were not calculated to satisfy his seeking spirit. He describes them as viewing the Saviour with regard only to his outward and visible appearance, wholly losing sight of that which is inward and spiritual, as set forth in the Holy Scriptures.

When he inquired of these professors for Christ, whom beyond all things he desired to know, they told him his coming would be from heaven, meaning the firmament above us, and casting their eyes upwards, intimated in that significant way, to what point their own attention was directed. Thus these ministers of the letter failed in affording to the inquiring mind of the youthful Dewsbury, that instruction which his soul was longing for; and the experience of many subsequent years proved to him beyond question, that such a knowledge of the Father and the Son as is life eternal, was not to be obtained through such physicians of no value. His strict attention to outward observances, so often enforced by professors in attempted imitation of the saints of old, but not in the same spirit and life, in fasting, prayer, and in various other particulars, were equally unsatisfactory to him. His soul was in trouble, because of sin; and he found that no sacrifices which he could make, would avail to satisfy the Divine justice, or afford him peace. In the sentence of condemnation which he now felt within him, and in the utter impossibility which he found, with all his endeavours, of working out his own peace, was opened to his understanding the mystery of the cherubim, placed at the east of the garden of Eden, and bearing a flaming sword, which turned every way, to keep the way of the tree of life; by which sword, the righteous law of God, justice was executed upon the transgressing nature in him.

Are we not reminded by the outward views held up to this young man by professors in that day, of the tendency among our own professors to look back at the beggarly elements and creaturely performances, and the willingness of many to reject the spiritual inward religion which crucifies to the world, and the world unto us, and to substitute a belief in Christ as afar off, and as having done the work for us without us, instead of opening the heart to the sword of his Spirit, that the transgressing nature may be slain, Satan cast out, and the kingdom of the Son of God introduced there. The fleshly man loves ease and the friendships of the world, and a religion that will give little trouble, and not set the world against him. He would be called by the name of Christ to take away his reproach, but is ashamed to confess Him in a humble self-denying walk in his fear?

(To be continued.)

Unknown Voices.

For ages, all the lower tribes were curtly classed among dumb creation. Mollusks, it was said, had neither eyes nor ears, the cuttle-fish only excepted; their life was a mere dream; they were doomed to eternal silence. Now, we have learned to admire the beautiful structure of their eyes; now we know that they hear, and with an ear not only open to sounds, but able to distinguish the depth and volume of voices. In some shell-fish, the ear is a marvel of beauty; and even the lowest have at least one or more tiny chambers in which to catch the faintest sound, and a special nerve to carry it to their imperfect mind. A thunder-clap frightens the lobster to death; and the pirates of the north used to threaten the fishermen with the firing of a gun, which would kill their rich freight in a moment, and render it unfit for market.

Ants, also, are not devoid of such a sense. When the termites are busy building their gigantic houses, watchmen are seen to stand from distance to distance. Every two minutes, with truly marvellous appreciation of time, they strike their tiny tongue against the hollow wall. Instantly a loud hissing is heard, uttered by the labourers all over the vast building; and, with double zeal, and renewed vigour, they work in passage and chamber. The proud soldier-sentinel looks carefully round, to see that all are duly employed, waits his appointed time, and then repeats the curious warning. Bees are lovers of music, and know the voice of man. Huber, who, though blind, knew the strange people better than we who have eyes, tells us how they listen to the command of the "bee-father," and follow him wherever he calls them. This fact is well known in the East, where the owner draws them thus from their hives into the field, and leads them back again by a hiss or a whistle. Hence, "it shall come to pass, that the Lord shall hiss for the fly and for the bee that is in the land of Assyria."

How easily spiders are made to know the voice of their master is familiar to all, from many a sad prisoner's tale. When the great and brilliant Lauzun was held in captivity, his only joy and comfort was a friendly spider. She came at his call; she took her food from his finger, and well understood his word of command. In vain did jailors and soldiers try to deceive his tiny companion. She would not obey their voices, and refused the tempting bait from their hand. Here, then, was an ear, not only, but a keen power of distinction. The despised little animal listened with sweet affection, and knew how to discriminate between not unsimilar tones! So it was with the friend of the patriot,

Quatremere d'Ijonville, who paid, with captivity, for the too ardent love of his country. He also had tamed spiders, and taught them to come at his call. But the little creatures were not only useful to him, but to the nation to which he belonged. For, when the French invaded Holland, the prisoner managed to send them a message, that the inundated and now impassable country would soon be frozen over, so that they would be able to march over the ice-bridged swamps and lakes, for spiders, true barometers as they are, had taught him to read, in their queer habits, the signs of approaching weather. The frost came, and with it the French, Holland was taken and the lucky prophet set free. The spiders, alas! were forgotten.

Even the "hateful toad" has been the captive's friend and companion, and shown itself endowed with a fine ear, and remarkable talents. They come out of the dark night of their holes, when their self-chosen master's voice is heard. They take flies from his hand; but, what is the strangest of all, they actually learn to measure time; for more than one well-authenticated instance speaks of their having appeared only at stated times, when the jailor was absent, and all was safe.

Vile, venomous serpents and their kin, have an ear as subtle as their tongue, and show a curious love of sweet melodies, and gentle words of affection. The hooded snake, as many of us have seen in the East Indies, is fierce and furious when first captured. But the so-called conjuror rouses her wrath still more by blows and threats; the next moment, however, the blandest words woo and win her heart, and weave a charm which even the crafty snake cannot resist. Anon he raises his hand as if to strike; she follows it with wistful eye and playing tongue. It is a sight of strange, irresistible beauty, this combat between man and serpent. Each watches with intense attention—the dusky Indian ready to strike with brutal force, the cunning reptile waving in graceful curves, raising the strange spectacle-mark that surrounds her glittering eyes, and gathering venom for the fatal bite. But man remains the master. Now with soothing words, and now with soft caresses, he tames her fierce temper. Then he calls in the aid of music, and soon the animal raises her head as if in a rapture of enjoyment,and in a short time learns to weave quick mazes in the air, to twist and twine in most beauteous lines, and follow the master's hand wherever it bids her. Pliny tells us of sons of the African desert, who, with their eyes' glances alone, could rule over serpents. That race of men is lost; but many a Nubian may be seen at the upper falls of the Nile, who can imitate, with surprising precision, the call of the reptiles, and tempt them to come forth from every corner and crevice.

Vipers, also, and adders, are neither deaf nor dumb, and cannot help listening to the voice of temptation. They were, it is well known, formerly much used in medicine; and the precious Theriak, known even at the time of Nero, and still manufactured in Venice, Holland and France, consists mainly of the flesh of vipers. So, poor persecuted animals, they are caught in all countries, and, who would have thought it?—almost always by means of their acute hearing. In Italy, grim, swarthy men, of gipsy cast, are seen to stand in the centre of large hoops, and then to indulge in strange, fanciful whistlings. After a while, an adder is seen gently to glide up; another, and still another appears, no one knows whence; and all, gazing with glittering eye at the quaint musician, raise their spotted bodies up against the magic hoop. The deceiver takes them, one by one, with a pair of tongs, and thrusts them into a bag that hangs on his shoulder. The poor, deluded vipers are then carried to town, and kept by druggist and doctor, or sent in boxes filled with sawdust, alive all over the world. The French, of all nations on earth the most cruel to animals, have a still more wicked way of catching adders. They take the first they obtain, or any other snake they can seize upon, and, throwing it into a kettle of boiling oil, there roast it alive. The fearful hissing of the tortured creature is heard by its kindred; they come from under sunny banks, from the low furze and scrubby bramble bushes, and as they approach they are eagerly seized with hands defended by leather gloves. Some have said—men of Maine, we surmise—that it serves them right, because they are very intemperate reptiles. Naturalists—wine-bibbers themselves—have placed vessels filled with wine under hedges, and near piles of stones; the thirsty vipers come from all sides, and, soon getting drunk, fall into the hands of their captors.

Fish have no visible ear, it is said, and no external avenue for sounds from a distance. Still, they hear with great acuteness. On the continent of Europe, few castles and villas are without the favorite pond, and its broad-backed carp, and speckled trout. They all learn to obey the ringing of a bell, and come in eager haste to seize the morsels that young and old are fond of seeing them catch. Lacepede even speaks of some carps of venerable age that were kept in the gardens of the Tuileries for more than a hundred years. They would come not only at the usual signal, but actually knew the names that were given them, and rose to the surface as they were called. They were, however, haughty and proud, for they listened only to those they loved, and in vain were sweet words, in vain even tempting morsels, offered by strangers. The royal pensioners disdained to receive alms; they took only the crumbs that fell from the table of their master, the monarch. But even plebians among fishes hear; and it is not the fastidious carp only that cannot bear the grating sound of sawmills, and has his nerves shaken by the firing of guns. Sturgeons also, are frightened by loud cries, and thus driven into the fisherman's net; and the bleak-fish detests a drum so that he rather surrenders than endure its abominable rolling. An Italian has, of late, proved, in a brilliant manner, that fishes can not only hear, but actually obey, and execute orders; that, in fact, they show much higher endowments than they have heretofore beenthought to possess. He has tamed a variety of fishes, from the humble tench, to the gorgeous goldfish of China; and, as he bids them, they come and go, they rise or sink, and display their rich, ever-changing colors. Nay, they perform a miniature drama: a pike seizes a trout, and lets it go or brings it up to the surface, as the master commands with his voice.

It needs no proof to establish the hearing of higher animals; but even the lowest among them, and those that are almost mute, show their appreciation of sounds when carefully watched. The shapeless hedgehog, when tamed, will uncoil at the word of his owner, and the grotesque seal raises its uncouth head, with such beautiful eyes, high out of the water, to listen to music on shore. It loves to hear gentle voices, and is grateful for kind words. Of all things else, they bind it firmest to its master, and call forth its warmest affections. The tiny mouse, that finds a home in the hut of the Alpine herdsman, becomes there so tame, that it points its silky ears, and approaches at the whistle of the Senner, when at night he returns to his meal and his rest. Even with us it has been known to come timidly out of its corner to listen to a song.

The ancients say much of the delight with which the grazing herd listens to the flute of the shepherd. The Swiss, on his meadows and Alps, also knows full well, how exquisite is the ear of his magnificent cattle. There, in far greater freedom than in the narrow valley below, in the pure, bracing air of lofty mountains, with a clear, blue sky above, and rich, fragrant pasture around them, all their senses are sharper, all their instincts more fully developed. The leading cow, with the largest of bells, is unconscious of her honour and station. She shows it in her more stately gait, she affects a proud and haughty carriage. Wo to the bold intruder who should dare to precede her! But wo also to the wanderer from another herd! She knows, as they all know, in an instant, the tone of a bell that belongs not to their set; and, with each curiosity, often with savage hatred, they run to meet the stranger, and show her no mercy. Oh! the grief when the bell is taken from her. As upon leaving the stable of her home, or her own favourite pasture high on the mountain, when she has to part with her love and her pride she will weep bitter tears; and many are the instances of cows that have died when deprived of their harmonious ornament.—*Putnam's Magazine.*

For "The Friend

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 268.)

MARMADUKE COATE.

Marmaduke Coate, the son of Marmaduke and Edith Coate, of Hambridge, in the county of Somerset, England, was born in the year 16[illegible]. Whilst yet young, his parents were convinced of the Truth as held by the people called Quakers, and he was evidently brought up "in the nurture and admonition of the Lord." His parents suffered much in support of the doctrines of the Lord Jesus Christ, being fined and imprisoned. The sufferings of his father, at least as respects bodily confinement was unusual, even in that day. For tithes his imprisonments were long, and the spoiling of goods not small, but through all he continued faithful, bearing an honest testimony by his walking truth, and cheerfully suffering for it, and leaving seed behind him, to bear similar sufferings in the same blessed cause.

In the Fourth month, 1670, Thomas Whitehead and Jane his wife, being at Yeovil, held a meeting at the house of Henry Lavor, in that place. A magistrate named Helliar, with his officers and some soldiers, came where Friends were assembled, and although it appears that nothing had been said, yet he turned the Friends out of the house, and conducted them prisoners to a neighbouring inn. As they passed along the street, Thomas Whitehead exhorted those about them "to repent and fear God." His wife also made some similar remarks. For this they were each fined £20, and the money was collected off the Friends, who had assembled at the meeting. Marmaduke Coate, the elder, was there, and being a man of substance, a portion of the fine was £20.

In the Eighth month, the same year, Marmaduke was sued for tithes, for which, as he could not conscientiously pay the demand, he was cast into prison at Ilchester, where he was found, in the Fourth month, 1678, by John Whiting, who was committed to that place. Henry Walrond, whom John Whiting characterises as the greatest persecutor in the county of Somerset, was particularly severe to Marmaduke Coate, because being a man of property, he could the more easily make unrighteous gain

of him than his poorer neighbours. During armaduke's long imprisonment for tithes, on one casion having a little temporary liberty allowed m, perhaps by the jailer, to go and look after his airs at home, Walrond committed him again, though already a prisoner in the eye of the law. any were the distraints he made on the goods of is innocent prisoner, until on one occasion meet- g with a check, he confessed to Marmaduke that thing prospered with him, and promised that he ould persecute no more. This fit of repentance as soon over, and afterwards he was even more tter than before, particularly towards Marmaduke. e had been a man of property, with a fair estate, d a fine noble person. But when he put his nds to the work of enriching himself, by spoiling s honest neighbours, everything went against m. He became so poor at last, that no one would ust him for a sixpenny loaf, and he had to spin make a pitiful subsistence before he died. Whit- g makes concerning him, an old saying, "Such a rifty trade is persecution, that it leaves men never friend in heaven or on earth." After stating at Walrond "died miserably poor, as well as iserable otherwise," he gives a saying of Walter aleigh,—"These are the men that sought the isery of others, and misery found them out."

In the year 1682, being still in prison, Marma- ike Coate, John Coate, probably an elder brother, d a number of others prepared the following ad- ess:—

"To the Judges of Assize, in the County of So- erset.

"The representation of the people of God, called uakers, in humility,

"Sheweth,

"That we profess faith in one only God, through r Lord Jesus Christ, whom we worship in his pirit, according to the Holy Scriptures, and in the adings of the same, are taught to love God above l, and our neighbours as ourselves, and to lead a uiet and peaceable life in all godliness and hones- y; and do own Charles the Second to be chief agistrate of this kingdom, and other his dominions, s being eminently preserved and brought into the overnment thereof, by the immediate hand of God: nd do still resolve to be subject to him, and those authority under him for conscience' sake, as good rotestant subjects, truly desiring to answer the ast end of government, which is for the subduing f sin and vice, and encouragement of righteous- ess and virtue.

"Yet notwithstanding we have been, and many f us are still exposed to such perils and sufferings s must inevitably bring many peaceable and in- ustrious families, who desire the good of the king nd kingdom, to utter ruin and destruction, and iat only for their pure conscience toward God, before whom we must all appear, and give an ac- ount, and receive a reward according to the deeds one in the body,) and that by laws made against apists, or meetings to plot and contrive insurrec- ons, under pretence of religious worship, and sedi- ous conventicles, which principles and practices re utterly deny and detest, as our peaceable de- ortment under many great sufferings, by those ormerly in power, and since also, may sufficiently anifest. Some few particulars of our late suffer- ngs annexed, are presented to your consideration, or this end, that as Providence orders your coming his circuit to do justice, you may not be altogether nacquainted with our sufferings, but may use your uthority to relieve the oppressed, and put a stop o the cruel proceedings of our oppressors; at least iscountenance such unmerciful practices. That o ye may appear to be such as are a terror to vil-doers, and a praise to them that do well, which is truly acceptable to the Lord. Therein his peace and blessing will be with you, which is the earnest desire and prayer of the innocent suffering people aforesaid.

JOHN COATE,
JOSEPH LYE,
MARMADUKE COATE, &c."

Marmaduke Coate, the younger, the subject of this memoir, on the 11th of the Ninth month, 1684, was taken at a meeting at Gregory Stoke, by Walrond, and sent to Ilchester prison, where his father still was. On the twenty-sixth of the same month, Edith Coate, a daughter of Marmaduke, the elder, being with others at a meeting in Ilminster, to worship God in spirit and in truth, as they had for many years regularly done, Henry Walrond came with his troop, arrested a number of whom Edith was one, and the next day committed them to prison.

At the Sessions, in the Eleventh month, eighty-three of the Friends, in the Somerset prison, were liberated by court, and in the following month, thirty-two more were released by the jailer. Among these last appears to have been Marmaduke Coate, the elder. He was, however, through the instrumentality of his persecutors, in again for tithes before the month had expired. Whilst a prisoner for tithes, he was indicted for absence from the parish place of worship, and fined for a breach of law, which he could not have prevented.

In the Sessions held in the Fifth month, 1684, at Bridgewater, in Somerset, the prisoners again addressed the justices, who discharged several of those then recently committed. Again, in the Sixth month, they addressed the justices appointed to hold the assizes at Wells. Still Marmaduke was kept a prisoner. In this summer his beloved daughter Edith was taken sick and deceased. We know not whether the privilege was granted him to take a last farewell of her or not, but we know that he who pitieth those that fear him, is a God of comfort, and able to consider his faithful children under every trial that can come upon them. Walrond fined many of the neighbours, who attended her burial.

King Charles the Second dying, his brother James came to the throne, and being inclined to favour the Catholics, he was willing to favour all who, for dissent from the Church of England, were in prison. He put forth a proclamation for a general pardon on the 10th of the First month, 1686, and as the executive part thereof was committed to the justices, Friends in the Somerset prisons prepared a statement and address to be laid before the the Quarter Sessions held at Wells, on the 30th of the same month.

(To be continued.)

From Chambers' Journal.

"Half a Second."

(Concluded from page 267.)

A compatriot of our own—Meikle, a Scotchman—devised a simple contrivance by which the costly apparatus of the French savans was superseded, while far greater accuracy could be attained in the computations. He caused a circular and solid wheel to revolve with regular motion once in every second. Choosing a dark but clear night for his operations, he placed a candle behind the wheel, near whose edge he had previously cut a narrow slit or opening. As the wheel revolved, the light was shown through this aperture like a flash once per second, and then instantly obscured. At the same time, a projecting tooth fixed to the wheel struck a quick sharp note upon a bell; also one in each revolution. Thus, in every second there was a flash of light and a stroke of sound recurring with perfecting regularity. The observer then placed himself before the instrument on a spot where the light and the sound reached him together. Retiring further off, he found that the bell-note lagged: the distance was greater, and the light arrived before the sound. Still retreating, however, he arrived at length at another spot where the two came together again; only that, in this instance, the flash of one revolution coincided with the stroke struck a second before. The interval between the two points showed precisely the distance travelled by sound in one second of time. If the observer removed yet further, the flash and note were once more separated, and were again united upon reaching the point where the light caught up the sound which had been two seconds on its journey. By this device, not only is it possible to multiply the observations easily and indefinitely—the single flash and report of a cannon being replaced by many hundred repetitions of light and sound—but the influence of surprise is quite superseded. The observer need not stand with attention painfully on the stretch, to catch first the flash and then the report as they arrive, but may coolly move to and fro, watching the light and listening to the toll as they are visible and audible every second, and fixing upon the exact spots where both appear to reach him in perfect concurrence. The net result of the observations and distances thus measured, is to assign 1142 feet as the space travelled over by the air-pulses of sound in a second of time, and in the ordinary state of the atmosphere. This velocity is equivalent to about thirteen miles a minute. It is hardly probable that the error in this computation should be so great as the fortieth part of a second. Practical uses of this acoustical fact are not unfrequent We have all learned that by noting the interval between the lightning and consequent clap of thunder, the distance of the electrical disturbance, and remoteness of peril, may be safely determined. From a similar observation upon the guns of an enemy, our sailors are able to ascertain the distance of his batteries, and regulate the range of their own broadsides.

Upon the lightning itself—or its tamed and domesticated relation, the electric spark—some computations of still more miraculous delicacy have been accomplished. The process employed owes its invention to Professor Wheatstone, though succeeding philosophers have varied and improved his apparatus. His principle is beautiful in its simplicity, and readily adapted to the various conditions of the problems to be solved. For instance, the professor wished to know how fast the electric current travelled along a wire. He measured, therefore, a mile of the wire, tipped both ends with brass knobs, wound up the whole length, so that the two knobs should be brought nearly close together, and then ran a stream of electricity in at one and out of the other ball, through the wire. The electric fluid, as its custom is, produced sparks as it jumped across to or from the balls, while sparks were developed in pairs, one at the entrance, and the other at the other at the exit of the electricity, very close in apparent position, but actually separated by a whole mile of wire. The exit spark was, therefore, later than the entrance one by the time taken up in travelling a mile. This interval was, however, too short to be perceptible; and to the eye, both sparks seemed to pass at the same instant. Mr. Wheatstone, therefore, aided the natural organ by a measuring-instrument of wonderful powers. He placed a small mirror on a spindle, which he caused to revolve with extreme rapidity. This mirror he placed in a proper position with respect to the balls above mentioned; and having darkened the room, sent a stream of sparks along the apparatus. Fast as the fluid shot along the

wire, one spark was found to be so far behind the other, that the mirror had partially revolved during the interval, and therefore reflected it in a different direction. Measuring this difference, and knowing already the rate of his mirror's revolutions, the professor succeeded in computing the time occupied by the electric current in travelling a mile, even though this time was less than the 200-thousandth part of a second. More recent experimentalists have refined on his idea, so far as to measure the electric time of travelling through twelve feet. They wished to determine whether the electric fluid passes more rapidly through water than air, and the former fluid was not sufficiently transparent to enable them to operate on a greater scale. Their improvement on Wheatstone's apparatus consisted chiefly in the contrivance of receiving the reflections into the optical field of a powerful telescope, instead of a bare screen. In the hands of MM. Foucault and Fizeau, this plan succeeded so well as to enable them to detect and appreciate intervals of time corresponding to the 77-millionth part of a second.

Another variety of the same principle was applied by M. Arago in measuring the duration of the flashes of lightning. A wheel was constructed of some black and roughened substance, with exactly 100 spokes or rays of bright silver stretching across it from centre to circumference. If the wheel be made to revolve pretty quickly, the silver rays will become intermingled, and the whole surface will appear bright and shining to the eye. Say that the revolutions are at the rate of 100 per second; then it will take a hundred times a hundred—that is, the 10-thousandth—part of a second for each ray to pass over the interval which separates it from its neighbour, so as to produce the impression of a wholly brightened surface. If the wheel so revolving in the dark be illuminated by a flash of lightning, it will accordingly appear entirely white should the flash last but to the 10,000th of a second; but as it does *not*—as, on the contrary, the white rays and black intervening spaces are defined with as much sharpness and clearness as if the wheel remained perfectly at rest—M. Arago was justified in concluding, that even the most brilliant and extensive flashes, which seem to embrace the whole horizon, are begun and over in less time than that. There might thus be 10,000 flashes of lightning while the clock ticked once, and yet not one of them begin before its predecessor had expired.

After its application to 'Heaven's artillery,' the same principle was applied to measure the performances of earthly ordnance. By the silver-rayed wheel we have just described, the duration of the flash from a cannon or musket—which signified the time taken up in the ignition of a charge of gunpowder—could be easily determined. Somewhat more difficult it might be to measure the velocity of the bullet as it issued forth from the mouth of the piece; yet even this was accomplished by a dexterous employment of electric currents. The projectile was shot through screens formed of delicate mesh-works of electrified wire, and placed at measured distances behind one another. As the ball passed through each screen, an electric current was let loose, and a spark emitted at the end of a conducting wire. This spark was received upon a steel ring, kept in rapid revolution, and left a trace upon it. Fresh sparks were produced as the bullet traversed each web; and the final position of the marks left on the steel ring showed how long it had taken to travel from screen to screen. This instrument was invented by a Prussian artillery-officer named Siemens. Its indications can be trusted to the 40-thousandth of a second; and upon the results so obtained, much of our modern perfection in artillery practice is based. If Prussia has held back from an active co-operation in the present war, we are yet indebted to her for some of the efficiency with which our allied soldiers and seamen crush the defences of the great enemy.

There is yet another branch of investigation—perhaps more extraordinary than any we have mentioned—in which minute measurements of time have been required and accomplished. Here, also, it is a German, Professor Helmheltz of Koenigsberg, who has achieved the desired result. The object in view is nothing less than to find the time expended in the production of sensation, or in the transit of perception through the subtile tissue of the nerves in the human body. Our frame is almost everywhere interlaced with minute nerves, through which we feel pleasure or pain, as the case may be; but the nerves themselves have no feeling of their own—they do but report occurrences to the brain, where the real seat of sensation is located. The brain, in its turn, causes its will to be performed by the muscles, which receive the sovereign commands from head-quarters through the same medium of the nerves. This nervous organization resembles a system of telegraphic wires, converging from all quarters towards some mysterious council-chamber, and thence again radiating to the several executive departments. When sensation leads to a consequent action—as, for example, when, upon feeling a blow, we knock down the striker in return—the result is brought about by a very complex series of operations. Thus the nerves report the incident—that is, the blow—to the brain; the brain perceives and resolves; its resolution is transmitted along other nerves to the proper muscles; and these, finally, by an independent mechanism of their own, perform the desired movements. Each of these operations requires time for its accomplishment; very little time, no doubt—in fact, so brief, as to be inappreciable by ordinary observation—but, nevertheless, quite susceptible of measurement by Herr Helmheltz's instruments. His apparatus is much too complex to be here described, but some of his results are sufficiently curious. When a galvanic shock is passed in a certain mode through the wrist, it produces both an involuntary impulse and a natural desire to clench the fingers. The first effect is caused by the direct action of the galvanism upon the muscular tissue; for the second, the news must get to the brain, and the order issues thence back again to the muscles. One action is therefore immediate, while the other requires time; and the consequence is, that a single shock occasions a double effect: the fingers are clenched twice, once involuntarily, and once 'by command' of the brain, with a distinct interval between the two motions.

As the result of innumerable trials, the professor states his belief, that the nerves communicate intelligence at a rate of 195 feet per second. If, therefore, we hurt our great toe, nearly one-fortieth of a second must elapse before we actually feel the pain. When the ear is the seat of injury, the brain gets the news so much the quicker. In the same way, an injunction from the sensorium will reach the tongue earlier than the hand or foot; so that, by the natural order of things, we are taught to speak before we strike. In animals of larger growth than man, the case is still more strange. A full-sized whale, it appears, cannot feel a wound in its tail until a second after it is inflicted, and takes another second in sending back orders to the tail to defend itself. It is all very wonderful. On one side, we find that 'a moment' can be divided into millions of distinct intervals; and on the other, we learn that our established maximum of velocity, 'as quick as thought,' is comparatively but slow-coaching after all!

For "The Friend."

"The love, power, and peaceable spirit of the Lord Jesus Christ, being the alone true authority of all our meetings, it is the fervent concern of this meeting, that they may be held under the sense and influence of that holy unction." "The more we experience a preparation of heart for the exercise of our respective gifts, the more amply shall we evince the *expression of the tongue to be seasoned with that living virtue and divine power, which proceeds from our holy Head;* and thus in conducting the important concerns of society, we shall be enabled to example the beloved youth in a manner which would demonstrate to them, that neither tradition, nor a mere outward education, can fitly prepare them for successors in the church of Christ." *Philadelphia Discipline.*

What kind of meetings can we expect to have if the speakers, for want of preparation, should not yet have received gifts from Him who ascended up on high, to occupy in his church but who act from the promptings of their own unsubdued wills, relying on their talents, education and standing among men as authority and qualification to speak in the church? Are speeches delivered without any divine authority, to be taken as the sense and judgment of the church? If the great Head does not preside and direct the speakers, would its conclusions have any more virtue and weight than the decisions of a debating society—and would an assembly controlled by unauthorized speakers, possess the characteristics of the church of Christ—and what kind of example would such be to the youth,—would they lead them to Christ and to his sheepfold, if they do not know him to be their own shepherd?

Preservation of life in shipwreck.—Amongst all the means proposed for the preservation of life from drowning, the most simple, efficacious, and easy of application, seems to have been nearly, if not wholly overlooked, in the wearing of an air-collar, round the neck. It cannot be too generally known, that the specific gravity of the human body is about three per cent. less than that of sea-water. Of this any one may be easily satisfied by going into the sea to a sufficient depth, when, on throwing his head a little back and taking the feet off the ground, the person will float with the face above water, for any length of time, without the smallest movement of any of the limbs, which, indeed, in swimming are only useful in propelling the body; but it must be observed that no part of the body except the head should be out of the water. It follows, therefore, that a very small matter is sufficient to counterpoise the weight of the clothes, for which purpose a collar, containing a small quantity of air, will be amply sufficient, which, if covered by black silk, would only have the appearance of the common black stock. The writer has found that the raising of more of the body, above the surface, by adding to its buoyancy, only subjects it to be rolled about most unpleasantly.

Death of an Eccentric Character.—On the 8th ult. says the *Leeds* (England,) *Intelligencer*, were consigned to their final resting-place, in the churchyard of Keighley, the mortal remains of one of the most eccentric individuals that ever lived. In fact, a parallel seems scarcely possible, of a man voluntarily going to bed in good health, and remaining there for a period of forty-nine years! The man's name was William Sharp, and he lived at a place called "Worlds," in the parish of Keighley. He was the son of a small farmer, and when thirty years of age he took to his bed and the room, which he never left till carried thence on the day of his funeral. The principal reason seems to have been a

trimonial disappointment. The wedding day s fixed. Accompanied by a friend he wended his y to the parish church, and there awaited the ival of the bride elect. But the bride never ne. The father of the damsel sternly and steadily used his consent. This preyed heavily on a mind t endowed with more than average intellect, and aring unmistakeable traces of hereditary singular- ; and the result was, that the young man confined nself to a small room, measuring about nine feet every direction, with the determination of spend- g the remainder of his existence between the nkets, which resolution he kept most unflinchingly. this dreary cell, whose only inlet for fresh air ring thirty-eight years was the door occasionally t open, did this strange being immure himself. e obstinately refused to speak to any one. His ther, by his will, made provision for the temporal nts of his eccentric son, and so secured him a nstant attendant. He certainly, physically at st, did credit to his food, for, though arrived at e old age of seventy-nine years, his flesh was firm, r, and unwrinkled, save with fat, and the esti- te of his weight was two hundred and forty unds. Shortly before he expired he was heard exclaim, "poor Bill, poor Bill, poor Bill Sharp!" e most connected sentence he had been known to ter for many a year.

Nothing does reason more right, than the coolness those that offer it; for truth often suffers more y the heat of its defenders, than from the arguments its opposers.

Seek not to be rich but happy: the one lies in gs, the other in content, which wealth can never ve.

THE FRIEND.

FIFTH MONTH 10, 1856.

Books, though silent, are very efficient companions r good or for evil. The mind conforms more or ss to the models presented by them for imitation, nd the tone of thought and feeling is greatly in- uenced by the authors, with whom we are in the abit of holding converse. To all who feel the im- ortance of cultivating a religious frame of mind, it highly desirable that ready access should be had o the works of those who have themselves been dis- iples of Christ, and have written of what their eyes ave seen, and their hands have handled in the ay and work of salvation. The conflicting Chris- ian, at times almost borne down with the trials ermitted to befal him, finds consolation and en- ouragement in the record of the close provings ndured, and the testimony to the all-sufficiency nd continued mercy of our Divine Master, left by hose who have preceded him in the same path of elf denial; while the young and inexperienced erive great benefit from the influence which reli- ious reading exerts on the natural disposition, and n giving a serious bias to the mind. It is equally rue, that where men or women are held up as nodels of Christian character, the history of whose laily walk gives evidence of their want of being horoughly initiated into the spiritual life of the gospel, those who admire and copy after them will be very likely to be but dwarfs themselves; and where such have been members of our religious Society, and have practically illustrated their want of a right appreciation, or a faithful maintenance of any of its testimonies, their works or their biogra- phies will be likely to produce in the minds of their inexperienced readers a corresponding disesteem for these testimonies, a laxity in conduct and conversa- tion, and to weaken the love of such for our Society.

Many of the productions of the press in the pre- sent day, even of those of a professedly religious character, and some having the sanction of names very popular amongst us for their accomplishments and supposed liberality, have a marked tendency to undermine a belief in the divine origin and un- changeable character of many of the scruples of our early Friends, and of the faithful among us, down to the present day, to strengthen the govern- ment of the Spirit of the world, and to blind the eye, which when rightly anointed, clearly discerns the continued necessity of the same simplicity and self-denial that has marked the footsteps of all true Quakers since the days of George Fox. To this cause may, we believe be attributed in part, the in- creasing departure from original principles and practices, especially as regards plainness in dress and address, becoming simplicity in living, and an entire avoidance of mingling in formal modes of worship, or countenancing a man-made and hireling ministry.

It is therefore a matter of great importance that Friends—especially young Friends,—should be able to obtain a full supply of diversified interesting works, free from these objectionable features, and tending to foster and confirm an intelligent attach- ment to the principles and testimonies which Friends both individually and as a religious body, are called to maintain.

On this account, we think the Book Store estab- lished some years ago, under the superintendance of the Meeting for Sufferings, the good supply of works approved by the Society, kept at it, and the con- tinued effort made to add to that supply, and pro- mote the distribution of these works, are of great value, and commend themselves to the liberal en- couragement of Friends everywhere. There is now quite a variety of books to be found there, treatises, biographies, and journals, affording all willing to peruse them, an opportunity of becoming acquainted with the origin of the precious testimonies that Friends are called to maintain before the world, and also with the suffering which it cost the primi- tive believers amongst us to uphold them unflinch- ingly, and to labour for the promotion of righteous- ness on the earth. We are well aware, that no- thing but submission to the operations of the Holy Spirit, in the heart, walking by the same rule and minding the same thing that so eminently enlight- ened and sanctified those true believers, can make any in our day, heartfelt partakers of the same Divine religion, and of the strength and consolation that it always carries with it, nevertheless we are persuaded that where Friends are careful to have reading of the kind we have alluded to practised in their families, a relish for it is early acquired, and it has no inconsiderable influence in producing and promoting a settlement in religious views, and a love for the household of faith.

We subjoin the report of the Book Committee for the past year.

"During the past year 3918 books and pamphlets have been taken from the store, of which 2452 were sold, and 1466 were gratuitously distributed.

"Two Preparative Meeting Libraries have been furnished with 22 volumes; 13 volumes were obtained for two First-day School Libraries; 30 for West-Town Library; 40 for "Library Associa- tions of Young Men for Religious Enquiry,"—one at Cincinnati, Ohio, one at Louisville, Ky., one at Lexington, Ky., one at St. Louis, and the other at New Orleans; 25 were given to the Workingmen and Mechanics' Library at West Chester, Pennsyl- vania; 6 to a Library at Atlantic City, N. J.; 24 to the Philadelphia City Institute, and 16 to two other libraries in this city; 36 were furnished to the State Library at Harrisburg; 9 to the State Lunatic Hospital, Maryland; 9 to the Yonkers' Library Association, New York; 44 to the Mer- cantile Library, St. Louis; 11 to the Library of the University of Illinois. Others were given to libraries at Pittsburg, Meadville, and Shoemaker- town, in this State. For many of these Institutions very full acknowledgments have been received, indicating that they considered the books as valu- able additions to their libraries.

"Twenty bound volumes and 17 pamphlets were given to a person going to Port au Prince, part of which were in French; 10 were obtained for per- sons in Indiana; 32 for Iowa; 12 for Ohio; 23 were for Canada; 2 for Kentucky; 3 for Illinois, and others were taken for persons in New Jersey, Delaware, and various parts of Pennsylvania. There has been given to professed teachers of religion 14 copies of Barclay's Apology, several of which were on their own application; also other works illustrating the principles of the Society, were obtained by these individuals who were residents of various States.

"During the year, 'The Original and Present State of Man, Briefly Considered, &c., by Joseph Phipps,' has been stereotyped, and an edition of 600 copies struck off; 250 copies each of George Fox's Journal, and Barclay's Apology, 500 Penn's Rise and Progress, 500 of the Ancient Testimony, and 1000 copies of Sewel's History, have also been printed. The latter work has been very generally purchased, 1300 copies having been disposed of in about 14 months, and principally to members of our Yearly Meeting.

"The sale and distribution of so large a number of books illustrates, we think, the advantage of having a Depository where the approved publica- tions of the Society may be readily obtained by all who wish to possess them. We are encouraged to believe, from the increased applications for them, that they may be read by more individuals than formerly. We have no doubt the general circula- tion and perusal they have received of latter years, has tended to correct misapprehensions respecting our religious sentiments in many sober enquirers, and in some instances removed prejudices which had been imbibed for want of correct information."

Philadelphia, Fourth month 17th, 1856.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to Fourth mo. 19th. The only important feature of the news is the closing of the Peace Congress, which took place on the 16th. It was expected that the ratification of the treaty would be promulgated about the end of the month; the protocols be published, and the labours of the Conference made known in detail. The questions considered at the last sessions were, the free navigation of the Danube, the in- terior Regime of the Principalities and the arrangement of the Frontiers, and the situation of the Christians in Turkey. For these purposes, three Commissioners were appointed. Diplomatic movements of importance are said to be on foot with respect to Italy. The Austrian Ambassador was to go immediately to Rome on a special mission. The unfriendly feeling between Austria and Sardinia was increasing, and the former appeared disposed to occupy as much of Italy as possible. Additional Austrian troops were under orders for the Roman States, and the garrisons in Lombardy were to be increased.

RUSSIA.—The Emperor of Russia signed the ratifica- tions of the treaty on the 15th, and public thanksgivings were ordered throughout the country. Vast enterprises have been projected by the Government, intended to develope the internal resources of the empire. The stock for new Russian railroads is already in the London mar- ket, and is said to find favour with capitalists, the Rus- sian Government guaranteeing five per cent. to the stock- holders.

SPAIN.—On the 9th and 10th ult., a formidable in- surrection broke out in Valencia, but it had been sup- pressed without much bloodshed. It seems to have been excited by the drawing of the conscription.

GREAT BRITAIN.—On the evening of the 17th, the Lord Mayor of London gave a banquet in honour of the arrival of Geo. M. Dallas, the representative of the United States, at which many distinguished persons were present. The sentiments expressed by the American Minister, the Lord Mayor, Lord Stanley and others, were of the most friendly and liberal character. All of them deprecated any interruption of amity between the two nations. In Parliament, Lord Panmure stated in answer to a question by the Earl of Elgin, that the troops and munitions of war, which were about being sent to North America, were merely intended to replace those drawn from thence during the war, and were not designed as hostile towards the United States.

Liverpool Markets.—Cotton had been active during the week; the sales reached 126,000 bales, and prices had advanced $\frac{1}{4}d$. The market for breadstuffs was dull, and prices continued to decline. Western Canal flour, 29*s.* a 31*s.*; Philadelphia, Baltimore and Ohio, 33$\frac{1}{2}$*s.* a 35*s.* Breadstuffs and provisions generally were falling in price in all the European markets. The London money market continued stringent. Consols, 93$\frac{1}{4}$ a 93$\frac{1}{2}$.

NICARAGUA.—The forces of Costa Rica having entered the territory of Nicaragua, and taken the town of Rivas, were attacked in that position by Walker, on the 11th ult. After a sanguinary engagement in which both sides suffered severely, the troops of Walker withdrew, leaving the Costa Ricans in possession of the place. At the latest accounts, the latter were at Virgin Bay, and were threatening Granada. The transit, too, was in their hands, and a number of passengers who left New York on the Orizaba, have been compelled to return. President Mora, of Costa Rica, had issued a decree, declaring that foreign prisoners, taken with arms, should be punished with death. Under this decree, seventeen of the prisoners taken at Santa Rose, had been executed.

SOUTH AMERICA.—The latest dates from the South Pacific are Valparaiso, the 15th; Lima, the 27th; and Equador, the 31st of Third mo. At Valparaiso, a violent storm from the north had swept away the fine iron mole of Conzano and Garland, causing a loss of $200,000. The storm was attended by a tremendous fall of rain, which it was feared had caused considerable damage to the crops. A bank of discount and deposit was about being established in Valparaiso, under sanction of the government. A treaty of free commerce between Chili and the Argentine Republic, was about being confirmed. Flour was scarce; price, $10 per bbl. The affairs of Peru continued in a disturbed and unsatisfactory state. The yellow fever was raging, both in Callao and Lima. Monte Video and Buenos Ayres were again in arms, expeditions from the former province having invaded the latter; the invaders had been expelled with great loss.

UNITED STATES.—*Congress.*—The proceedings in both Houses have been without especial interest. In the House of Representatives, the Committee on Commerce have reported a bill establishing collection districts, designating ports of entry and delivery, and modifying the revenue laws. The bill is the longest ever presented to Congress, comprising 350 pages; after debate the consideration of the bill was postponed till the Sixth month. Kansas and the slavery question continue the chief subjects of discussion. A joint resolution has passed for enlarging the Custom-house, Post-office, and Court-house buildings at Cleveland, Ohio. In the Senate, Weller read a letter from General Walker, in which it is stated that the British Government has interfered in the present struggle between Costa Rica and Nicaragua, and furnished the former with arms. Senator Weller urged the recognition of Walker's government. Douglas also spoke favourably of Walker, and commended the present government of Nicaragua.

California.—The steamship Illinois at N. York brought the San Francisco mails of Fourth mo. 5th. She also brought nine hundred passengers and about two millions in gold. A terrible riot occurred at Panama on the 15th of 4th mo. in the first instance by a trifling dispute between an American passenger, who was intoxicated, and a native woman. As the excitement spread, the natives rallied in great numbers, and attacked the California passengers, about twenty of whom were killed, forty wounded, and others robbed. Some of the Panamese were also killed. The property of the Railroad Company suffered severely, much of it being destroyed by the rioters. The drought which had prevailed in California for two months, had been succeeded by copious showers. In the southern counties, however, a deficiency of pasturage was feared. The mines promised a yield, exceeding that of last year. At San Francisco, there were large speculations in breadstuffs, and flour had advanced in price.

Oregon.—Hostilities with the Indians continued. Several successful attacks had been made by them on the whites. The Indians had captured the steamer Mary, on Columbia river. They had also killed a large number of citizens at the Cascades, and destroyed the town.

Kansas.—Further disturbances have occurred in consequence of attempted arrests of some of the Free State men, and a detachment of U. S. troops has been ordered to Lecompton, to assist Governor Shannon in maintaining the laws.

Philadelphia.—Mortality last week, 219. A destructive conflagration broke out on the morning of the 1st inst., between 12 and 1 o'clock. It commenced in the large rag and paper warehouse of Jessup & Moore, North st., between Arch and Market, and Fifth and Sixth streets, from whence it extended southward and westward to Market and Sixth streets, completely destroying forty-four buildings, and nearly all their contents. The houses on the west side of Sixth street, were on fire repeatedly, and were saved with difficulty. The building occupied by Friends' Select School for Girls on St. James street, west of Sixth, took fire, and with several other houses on the same street, was consumed. On the south side of Market street, nearly every store was on fire, from midway between Fifth and Sixth streets, as far west as Eighth street, and even at a great distance, many buildings were damaged by flakes of fire falling upon them. It is stated that more than 150 houses were on fire between one and five o'clock; but in most cases, the fire was soon extinguished. The total loss is estimated at $600,000, about two-thirds of which was insured. A fireman was killed by a falling wall, and several others injured. In an affray between the members of two hostile fire companies, a young man was fatally stabbed.

New York.—Mortality last week, 343. The exports of specie for the week, $1,814,638.

Miscellaneous.—The Famine at the Cape Verd Islands.—The Washington (D. C.) Intelligencer of 28th ult., publishes a letter from Lieut. Washington A. Bartlett, U. S. N., corroborating the fearful accounts of the desperate condition of the inhabitants of the Cape Verds, from the continuance of famine in the Islands. He says that at least 30,000 human beings must perish, if not very soon relieved.

Foreign Duties on American Tobacco.—American tobacco pays a duty in Bremen of one per cent. a pound; in Great Britain 72 cents, and 5 per cent. additional: Holland 28 cents per 221 pounds; Belgium $1.86 per 221 pounds; Sweden 5 5-6 cents per pound; Norway 4$\frac{1}{2}$ cents. In France, Spain, Sardinia, Austria, and Portugal, it is a government monopoly.

Short Passages.—The iron steamship Persia of the Cunard line, which sailed from New York on the 2d ult., arrived at Liverpool in nine days and twelve hours, being the shortest on record. Her return trip to New York was also a short one, having been accomplished in less than ten days. She made the passage to the bar in nine days, ten hours and fifteen minutes, but was unable to get into port on account of the tide.

Removing Intruders.—The U. States officials in Kansas have pulled down, or caused to be removed, all the houses in the town of Pawnee, on the ground that it was built on Indian land. One of the houses destroyed belonged to Governor Reeder, and cost $1000.

Fall of a Bridge.—A despatch from Montreal, dated Fourth mo. 30th, says, The new suspension bridge over the Falls of Montmorency, gave way this morning, and the whole structure with a man and woman and horse and cart, were carried over the Falls. The bodies have not been recovered.

Heavy Marine Loss.—The Committee on Commerce in the U. S. House of Representatives, state the amount of pecuniary loss incurred at the port of New York, in the years 1854–5, at $10,000,000.

The Eruption of Mauna Loa.—The Polynesian of Second mo. 16th says, "The flow of lava continues as active as ever. The stream has now nearly pushed its way through the woods, and is only four miles from the Bay. The stream of the Wailuka has gradually diminished, and the remaining water so hot that it is unsafe to cross."

WEST-TOWN BOARDING SCHOOL.

The Summer Session of the School will commence on Second-day, the 12th of the Fifth month.

The pupils will be conveyed by railroad to West Chester, where conveyances will be in waiting to take them and their baggage to the School, on the arrival of the morning and afternoon cars on Second-day, the 12th, and Third-day, the 13th of the Fifth month. The children will get their baggage the next day after their arrival. The cars leave the depot, south side of Market street, above Eighteenth street, at half past 7 o'clock, A. M., and at half past 4 o'clock, P. M. The agent of the School will be at the Railroad depot on Second and Third-day afternoons, and will furnish pupils with tickets, and accompany them to West Chester. Those who go by the morning train, will be furnished with tickets by a person in attendance. To those who procure tickets directed, the fare from Philadelphia to the School, including baggage, will be one dollar, which will be charged to the scholar at the School. All baggage should be distinctly marked West-Town, and with the name of the owner, and should be sent directly to the railroad depot.

The West-Town office is at Friends' bookstore, No. 84 Arch street, where all small packages for the pupils left before 12 o'clock, on *Sixth-days*, will be forwarded. *All letters* for the pupils and others at the School, should be sent by *mail*, directed to *West-Town Boarding School*, West Chester P. O., Chester Co., Pa. Packages should be distinctly marked, and put up in a secure manner, and when sent by Express, the freight should be *pre-paid*.

The stage will leave West Chester for the School, on Second, Fourth and Seventh-days, on the arrival of the *morning* cars, from the city, and from the School to West Chester on the same days, to meet the morning cars for Philadelphia. The fare for each passenger to and from West Chester by the stage, will be 25 cents. Where special conveyances at other times are provided at the School, an extra charge will be made.

West-Town, Fifth mo. 5th, 1856.

HAVERFORD SCHOOL ASSOCIATION.

The Stated Annual Meeting of the Haverford School Association, will be held at Committee-room, Arch street Meeting-house, on Second-day afternoon, at 4 o'clock Fifth month 12th, 1856. CHARLES ELLIS, Sec'y.

MARRIED, at Friends' Meeting-house at Sadsbury, Lancaster county, Pa., on the 19th of the Third month, THOMAS H. WHITSON, of Westgrove, Chester county, to PHEBE P. COOPER, daughter of George Cooper, of Lancaster county, deceased.

DIED, at the residence of her mother, in Wayne Co., Indiana, on the 10th of Third mo. last, ESTHER V. daughter of the late John and Esther Nicholson, in the 29th year of her age—a beloved and consistent member of Chester Monthly Meeting of Friends, Indiana. Ta dear, young woman, was for many months confined to her room, by severe indisposition, which she bore with a fortitude becoming a Christian. Her bereaved mother in speaking of her loss, says: "I mourn not as those without hope—having the consoling assurance that she was, through adorable mercy, prepared for a mansion in her Heavenly Fathers' kingdom. For the last two or three weeks, there was not a cloud to obscure the brightness of the prospect before her. She was desirous that her friends should know, that "death (to her) had lost its sting, and the grave its victory." She said, "now I know that my Redeemer liveth, and because he liveth, I live also." In the victory in her diary, after speaking of her long confinement, and there being no prospect of her recovery, she says: "The consideration seems, indeed, an *awful one*—the exchanging of my brief life of useleseness for an untried eternity. But my only hope, my every trust, lies alone in the merits and the mercies of Him who loved us, and gave himself for us; never, I believe, even in my darkest moments, have I doubted the power or the willingness of the Saviour to redeem and save us. The apostle testifies, 'He is able to save to the uttermost, all those who come unto God by Him, seeing he ever liveth to make intercession for us.' Then, unworthy as I am, may I not at last by Him cast down?" Oh my soul, and why art thou disquieted within me? Hope thou in God, for I shall yet praise him, who is the health of my countenance, and my God.'" Not long after writing the above, she came to realize the fulfilment of it in her own experience. Faith triumphed gloriously, and death was swallowed up in victory.

——, on the 1st of Fourth month, 1856, in the 52d year of her age, MARGARET, wife of Samuel Hollingsworth; an exemplary and much esteemed member of Middletown Monthly Meeting, Columbiana county, Ohio. She was favoured to bear a lingering disease with patience and resignation; and several times spoke of her close with feeling and composure; saying on her own account she had no desire to recover, but on account of her family she would be willing to be spared some time longer. A few days before her close, she said nothing appeared in her way. "My mind is easy. I want you all to give me up freely, and not grieve for me; there is One who can preserve you all, if you only apply unto him in a right manner." The day before she died, she expressed the belief that her close was near, and that there was nothing in her way; affording to her friends the consoling evidence, that her end was peace.

THE FRIEND.

A RELIGIOUS AND LITERARY JOURNAL.

VOL. XXIX. SEVENTH-DAY, FIFTH MONTH 17, 1856. NO. 36.

PUBLISHED WEEKLY.

Price Two Dollars per annum, payable in advance.

Subscriptions and Payments received by

JOHN RICHARDSON,

AT NO. 50 NORTH FOURTH STREET, UP STAIRS,

PHILADELPHIA.

Postage to any part of Pennsylvania, for three cents if paid in advance, three and a quarter cents; any part of the United States, for three months, if paid in advance, six and a-half cents.

From the Quarterly Review.

Zoological Sketches.

(Continued from page 274.)

If we may quote the brush-turkeys as instances of birds capable of affording a new kind of delicate and easily-reared food, the splendid Impegan pheasants, close at hand, bred here from a pair belonging to her Majesty, and which bore, in the open air, the rigor of last winter, may be looked upon as "things of beauty," which may be produced among us to charm the eye. The elands again, on the south side of the Garden, which have bred so prolifically, and made flesh so rapidly, may with advantage be turned out into our parks, where their beautiful forms would prove as attractive to the eye as their venison, of the finest quality, would to the taste.

But we can no longer tarry to speculate further on the riches of this aviary, which contains fine specimens of birds from all parts of the world. Passing along the path which takes us by the north entrance, we reach the pelicans' paddock, in which we see half a dozen of these ungainly creatures, white and gray, with pouches beneath their bills as capacious as the bag of a lady's work table. The visitor may sometimes have an opportunity of witnessing an explanation of the popular myth that the old bird feeds its young from the blood of its own breast. This idea arose from the fact that it not only empty the contents of its pouch into the mouths of its young by pressing it against its breast, but the act of doing which the feathers often became sanguined from the blood of the mangled fish within it. The close observance of birds and beasts in zoological collections has tended to reduce many fabulous tales to sober reason. On the other side of the walk may be seen in immature plumage one of the red flamingoes from South America, which is said to simulate so closely a regiment of our soldiers, as they stand in rows fishing beside the banks of rivers; and here, too, are the delicate rose-colour specimens of the Mediterranean flamingoes, which are likewise exceedingly beautiful. Those accustomed to navigate the Red Sea, frequently witness vast flights of these birds passing and repassing from Arabia to Egypt; and we are informed by a traveller that on one occasion, when he had a good opportunity of measuring the column, he convinced himself that it was upwards of a mile in length! That a splendid spectacle to see the pure eastern sky barred by this moving streak of brilliant colour. But we have not yet explored the north side of the grounds, wherethe huge pachydermatous animals are lodged. The difficulty caused by the carriage-drive running between the two gardens has been vanquished by means of the tunnel, the ascent from which on the opposite side, flanked as it is with graceful ferns, is one of the most charming portions of the grounds on a hot summer's day. If after passing through the subterranean passage we turn to the right, we come immediately upon the reptile-house. Unless the visitor selects his time, he will generally find little to amuse him here. The great snakes have either retired from public life under their blankets, or lie coiled upon the branches of the trees in their dens. The reptiles are offered food once a week, but will not always feed even at this interval. One huge python fasted the almost incredible time of twenty-two months, having probably prepared himself for his abstinence by a splendid gorge. After a fast of seven days, however, the majority of the serpents regain their appetites. Three o clock is the feeding time, and the reptiles which are on the look-out, seem to know full well the errand of the man who enters with the basket, against the side of which they hear the fluttering wings of the feathered victims and the short stamp of the doomed rabbits. The keeper opens the door at the back of the den of the voluminous serpents on our right—for of these there is no fear—takes off their blanket, and drops in upon the clattering pebbles a scampering rabbit, who hops from side to side, curious to inspect his new habitation; presently satisfied, he sits on his haunches and leisurely begins to wash his face. Silently the rock-snake glides over the stones, uncurling his huge folds, which like a cable seem to move as though by some agency from without, looks for an instant upon his unconscious victim, and the next has seized him with his cruel jaws. His constricting folds are twisted as swiftly as a whip-lash round his shrieking prey, and for ten minutes the serpent lies still, maintaining his mortal knot until his prey is dead, when, seizing him by the ears he draws him through his vice-like grip, crushing every bone, and elongating the body preparatory to devouring it. The boa, and the rock-snake always swallow their prey head foremost. How is that fine neck and delicate head to make room for that bulky rabbit? thinks the spectator. Presently he sees the jaw gape, and slowly the reptile *draws himself over*, rather than swallows, his prey, as you draw a stocking upon your leg. The huge lump descends lower and lower beneath the speckled scales, which seem to stare with distention, and the monster coils himself up once more to digest his meal in quiet. Rabbits and pigeons form the food of the pythons in these Gardens. While the smaller birds are preyed upon in the reptile-house, their big brothers, the storks in the paddock, are reciprocating the law of nature by eating snakes. As we pass to the opposite side of the serpent-room, where the venomous kinds are kept, we perceive that a more cautious arrangement is made for feeding. The door opens at the top instead of at the sides of their dens, and with good reason, for no sooner does the keeper remove with a crooked iron rod the blanket from the cobra, than the reptile springs, with inflated hood, into an S-like attitude, and darts laterally at his enemy. It seems incapable of striking well any object above or below his level: watch, for instance, that guinea-pig; again and again he dashes at it, but misses his aim; now he hits it, but only to drive the poor frightened creature with a score of flying pebbles before him: when at least he succeeds in piercing the sides of his victim, tetanic spasms immediately commence, and it dies convulsed in a few seconds. It is said by those who have watched venomous snakes that the manner of dying exhibited by their stricken prey discloses the nature of the reptile that inflicted the poisonous wound. It is scarcely necessary to state that the popular idea that the tongue darts forth the venom is a fallacy. The poison is contained in glands which lie at the root of the fangs on either side, and, by the compression of the powerful muscles which make the head appear so broad and flat, it is forced into the fine tube which runs at the sides of the fang, and finds its exit near the point by a mi[illegible]e opening. The cobra at present in the collectio[illegible] with its skin a glossy black and yellow, its eye [illegible]ck and angry, its motions agile and graceful, see[illegible]n be the very personification of India. As we w[illegible] it when ready to spring, we suddenly remember [illegible] only a film of glass stands between us and "pu[illegible] death." But there is nothing to fear; the python [illegible] the adjoining room, which weighs a hundred and twenty pounds, being incensed on his first arrival at being removed from his box, darted with all his force at a spectator. Yet the pane of glass had strength enough to bring him up, and he fell back so bruised about the head and muzzle by the collision, that he could not feed well for several months. The cobra that we see is the same that destroyed its keeper. In a fit of drunkenness, the man, against express orders, took the reptile out, and, placing its head inside his waistcoat, allowed it to glide round his body. When it had emerged from under his clothes from the other side, apparently in good humor, he squeezed its tail, when it struck him between his eyes; in twenty minutes his consciousness was gone, and in less than three hours he was dead. Before we leave this reptile-room, let us peep, for a moment into the little apartment opening from the corner, where hanging from the wall we see all the cast-off dresses of the serpents. If the keeper will allow us to handle one of them for a moment, we shall see that it is indeed an entire suit of light brown colour and of gauzy texture, which covered not only the body and head, but the very eyeballs of the wearer.

The Python-house on the other side of the Museum contains two enormous serpents. The adventures of one of them—the *Python reticulatus*—deserve to be written: when small enough to be placed in the pocket, he was, with a companion now no more, taken from Ceylon to Brazil by American sailors; they were then exhibited in most of the maritime towns of South America, and were publicly sold for a high price at Callao to the captain of a ship, who brought them to the Gardens, and demanded £600 for the pair: fully persuaded of their enormous value, he had paid £30 to insure them on the voyage, and it was not until he had long and painfully cogitated that he agreed to sell them for £40. We have before referred to the extraordinary length of time a python has been known to

fast without injury. Their fancies as well as their fastings are rather eccentric. Every one has heard of the snake who swallowed his blanket, a meal which ultimately killed him. A python who had lived for years in a friendly manner with a brother nearly as large as himself, was found one morning solus. As the cage was secure, the keepers were puzzled to know how the serpent had escaped: at last it was observed that the remaining inmate had swollen remarkably during the night, when the horrid fact became plain enough; the fratricide had succeeded in swallowing the entire person of his brother: it was his last meal, however, for in some months he died. A friend informs us that he once saw in these Gardens a rat-snake of Ceylon devour a common coluber natrix. The rat-snake, however, had not taken the measure of his victim, as by no effort could he dispose of the last four inches of his tail, which stuck out rather jauntily from the side of his mouth, with very much the look of a cigar. After a quarter of an hour, the tail began to exhibit a retrograde motion, and the swallowed snake was disgorged, nothing the worse for his living sepulchre, with the exception of the wound made by his partner when first he seized him. The ant-eater, who lately inhabited the room leading out of the Python apartment, has died of a want of ants.

As we issue again into the open air, we have before us the whole length of the avenue, arched with lime-trees, in summer a veritable aisle of verdure. What a charming picture it used to be to see the docile elephant pacing towards us with ponderous and majestic steps, whilst, in the scarlet howdha, happy children swayed from side to side as she marched. She, who was our delight for so many years, died in July last of a storm of thunder and lightning. Such indeed was what may seem at first the singular verdict of the medical man who made his *post-mortem*. The terror, however, inspired by the storm appears to have produced some nervous disease, under which she succumbed. There is a suspicion that the carcase, five thousand pounds and upwards in weight, which was disposed of to the knackers, ultimately found its way to the sausage-makers. Do not start, good reader; elephant's flesh is considered excellent eating by the tribes of South Africa, and the lion-slayer tells us that the feet are a true delicacy. He used to eat them as we do Stilton cheese, scooping out the interior and leaving the rind; he shows his audience some of these relics, which look like huge leather fire-buckets. And now we have only the young animal left that used to suck his huge mother, to the delight of the crowd of children, and to the disgust of the rhinoceros, who is the sworn enemy to all elephants. The little one is growing apace, however, and we hope soon to see him promoted to carry the deserted howdha. The rhinoceros, close at hand, is the successor of the fine old fellow purchased in 1836 for £1050, the largest sum ever given by the Society for a single animal. The specimen now in the Gardens cost only £350 in 1850, so much do these commodities fluctuate in value. His predecessor, who departed this life full of years, was constantly forced upon his belly by a pugnacious elephant, who pressed his tusks upon the back of his neighbour when he came near the palings which separated their inclosures. This rough treatment appears to have led to his death, as Professor Owen found, on dissecting the massive brute, which weighed upwards of two tons, that the seventh rib had been fractured at the bend near the vertebral end, and had wounded the left lung.

(To be continued.)

Depreciate no one; an atom has a shadow.

Selected for "The Friend."

It appears to me, that there are many in the present day, whose minds are constantly kept afloat by the great variety of publications almost daily issuing from the press. Many of these that I have seen, although replete with moral sentiment and learned remarks, which are not without Scripture foundation,—although very wide of the true intent and meaning of the text,—are strongly calculated to keep their readers in search of the lifeless shadow, and to divert their attention from the living and eternal substance. There are other persons again, who have actually commenced a reform in great sincerity, and have been drawn into solid and serious reflection; but these, unhappily, frequently fall into the way of a class of people, whose writing and conversation lead them to expect, that when they embrace the religion of Jesus, they will immediately witness some delightful sensations of heavenly joy. But, alas! they calculate on the reward before the warfare is begun.

If such, for a short season, persist in communing with their own hearts, and are, through condescending love and mercy, favoured to draw near to the Saviour of men, their expectation is disappointed; and they find that "He is without form or comeliness," and hath no "beauty" to make him desirable.

There is nothing to feed and support those airy and fantastic notions, which their minds have previously and so perniciously imbibed. Thus the inestimable pearl is overlooked, or set at nought,—the language of the prophet is verified, and the blessed Master is, I fear, at this day by too many, in this way "despised and rejected of men."

I am apprehensive, that the enemy of mankind was never more effectually served than at the present time, and in a way admirably adapted to the refinement of the age in which we live. The facilities for holding up the letter of the gospel, were perhaps never before equalled at any period; and yet great eagerness is evinced to peruse and swallow those fascinating baits, which serve to amuse and allure, (particularly when garnished with declarations from the undefiled lip of Truth,) and by their deadening effect upon the mind, prevent its coming under the influence of that pure and "quickening Spirit," which only, giveth life. By this stratagem, an easy and broad way is opened for the poor deluded traveller, so well accommodated to flesh and blood, that there might seem to be no necessity for any to "strive to enter in at the straight gate;" and yet the exaltation of the Saviour's kingdom, is professedly the object of many of these authors, without pointing out where it is to be found, and the terms on which only it is to be obtained. Regenerating grace is hinted at; but self-denial, and the daily cross, are seldom heard of. I am often bowed down under the consideration of these things, and of what will be the end thereof; and am sometimes ready to conclude, that a day of calamity will come, when these chaffy imaginations and beguiling inventions will be dispersed like withered leaves before an autumn blast; when the minds of men will be brought low, and humbled under the necessity of turning to Him, who hath been so long smitten and afflicted, and be made willing to sit under his holy teaching. That so all men may be brought to know him in all his heavenly offices, not only as a reprover and convincer of sin, but as a Comforter, and a gracious Redeemer, indeed; and may the Lord hasten the dawning of that glorious day, when he, who "was despised and rejected of men," shall become the chiefest of ten thousand and altogether lovely, saith my soul.—*Daniel Wheeler.*

Extracts

From the Minutes of our Yearly Meeting, held in Philadelphia, by adjournments from the 2 of the Fourth month, to the 25th of the same inclusive, 1856.

The following report on the state of the Boarding School at West-Town was read, and the labors of the Committee are satisfactory to the meeting:

To the Yearly Meeting.

The Committee who have charge of the Boarding School at West-Town report, that 71 boys and the same number of girls were admitted during the year ending Tenth month 16th, 1855; and the average number of pupils for that period was 22[illegible] of whom 110 were boys and 116 girls.

One death occurred very soon after the opening of the summer session; it is, however, cause for thankfulness, that the large family has been generally favoured with good health. Meetings for Divine worship have been regularly held on Fifth and Fifth-days, and have occasionally been attended by members of the Committee and other Friends. The deportment of the pupils on these occasions has been orderly and becoming.

The schools have been visited as usual at stated times by sub-committees of men and women Friends who also attended the semi-annual examinations and rendered such advice and assistance to the different departments as seemed to be required. The reports of these have indicated, that the objects for which the Institution was established have been kept in view by those who have the immediate charge of it. The progress of the pupils in their studies has been as great as at former periods, and has given evidence of the care and attention of the teachers, who we believe feel a lively interest in the advancement of their pupils. The same branches of study continue to be attended to that have been taught for several years past. The practice of reading the Scriptures and other religious books to the children, when assembled in the collecting room, is continued, and a part of their time is devoted as heretofore to committing memory portions of Scripture, Barclay's Catechism and Bevan's View which, at stated periods, are recited to the teachers.

The disbursements for family expenses have been $13,863 89; for salaries and wages $8,384 28; incidental expenses $375 25; repairs and improvements $902 38—making together $23,525 80. There has been charged for board and tuition $18,033. For rents of tenements, saw and grist mill, and profits on merchandise sold, $1090 66, making together $19,123 66, and leaving a deficiency $4,402 14, which is $2,247 37 more than the deficiency on these accounts the preceding year; $2,0[illegible] of which arises from additional cost of provisions.

The income of the fund for general purposes was $1,365 92; and the net balance to the credit of the farm was $2,466 88; which with the appropriation of the Yearly Meeting, gives a credit balance of $230 56. Besides the above charge $400 has been paid on account of the buildings for the accommodation of the dairy and the family having charge of it, in addition to the sum reported last year: and $231 76 has been expended on account of the two small tenements agreed to be put up, and alluded to in last year's report, making together $631 76; including which there is a deficiency of $400 90. There is $1,026 29 yet to be paid on account of the small tenements above mentioned.

It has been obvious for several years past, that considerable repairs to the buildings would be required in order to preserve them in a reputable and proper condition. Attention having been directed

spring to the urgency of some of them, and the ssary funds to put the premises in complete e having been voluntarily offered, a committee appointed to have the direction of the work, r whose supervision and that of the Superinent, the school buildings and nearly all the lling-houses were repaired. A new piazza was ıp at the west end of the building, and other r improvements were made, which have conted to the comfort and accommodation of the ly and preservation of the property.

he fences along the lane and around the houses ted upon it, being in a decayed condition, it is ded to renew them, and the materials are now g prepared for that purpose. Upon examining barn near the school buildings, it was found to ire a new roof and other repairs, the expense hich, with the cost of a new wagon-house, h is needed, was estimated to be a considerable of the amount that would be required to build w barn in a more convenient location, and on a which would serve both purposes. The funds uilding such an one having also been offered, as concluded to authorize its erection. A part he materials for it have been prepared, and it is pected that it will be ready for use by the middle he Sixth month.

nce the last report, new cases with glazed s have been put up in the room adjoining the e, for the accommodation of the Library, which been enlarged by the addition of about one sand volumes, some of which are valuable ks of reference. Many of the old books have ı rebound, and the whole collection has been ly arranged, and a catalogue prepared and ted. The cost of the new books, fitting up the a, and printing the catalogue, amounting to 68 62, has been defrayed by voluntary conıtions for the purpose.

rom the experience of late years, we believe no disadvantage will arise, if the rule which ts the admission of boys as pupils to those who under 15½ years of age, was changed so as to w the admission of those over that age, at the retion of the Superintendent; who should also uthorized to dismiss such pupils if their con- should not be satisfactory.

rom the high price of provisions, and from r causes, the expense of conducting the Institu- has materially increased. The cost of each ll last year was $24 09 more than the amount rged. To prevent encroaching upon the capital, ch must be the result if these causes continue, Committee believe it may be necessary to inse the price of board and tuition. They, therefore, suggest for the consideration of the Yearly eting, the propriety of authorizing them to charge exceeding $5 per term additional, if in their gment it appears to be best.

'or the last two years, about as many pupils e participated in the advantages afforded by seminary, as could comfortably be accommoed; and at times during that period, there were e applicants than could be admitted. This evice of the confidence of Friends in the school has n gratifying and encouraging to the Committee. ey hope it will continue to receive the support of members generally, believing that as there is a ed concern on the part of those who have charge it to conduct it in the fear of the Lord, and in formity to our religious principles and testimo-, it will continue to promote the moral and reous, as well as the literary improvement of many he rising generation.

Signed on behalf and by direction of the Comtee. THOMAS KIMBER, Clerk.

Philadelphia Fourth month 11th, 1856.

An interesting report from the Committee on the Civilization of the Indian Natives under our care was read, and the labours of the Friends engaged in this benevolent work are approved. It is the desire of the meeting, that the Committee may continue their efforts to support the school, and to advance the improvement and moral culture of the Natives in every respect.

As the income of our funds is inadequate to meet our expenses, the Yearly Meeting unites with the suggestion, to open voluntary subscriptions among our members, for the purpose of sustaining this work, and would encourage Friends to contribute liberally for the object. The report being as follows, viz:

To the Yearly Meeting.

The Committee to promote the Civilization of the Indians, report:—

That the Boarding-school at Tunessassah has been continued during the past year, and appears to be answering the design of its institution.

The number of boarders is 16; and beside these, from 7 to 12 day-scholars have attended. Their improvement in the different branches of learning is encouraging, and their deportment in school and in the family, generally satisfactory. The boys render some assistance when out of school, in such business as they are qualified for; and the girls are instructed in domestic employments.

Meetings for Divine worship are held on First and Fifth-days; in which the children conduct themselves in a becoming manner. A Friend residing at Tunessassah, in a letter dated, First-day, 1st month 26th, 1856, remarks: "We have been favoured with a quiet, comfortable meeting, and with an evidence of the Divine presence; which has been refreshing and encouraging. Where the presence of the great Head of the church is felt, we care but little about numbers, except the interest we feel in the welfare of others, that they may be made partakers with us."

The Holy Scriptures are daily read; and there is suitable religious reading at other times. The experience thus far of the effects produced by the Boarding-school, confirms us in the belief, that it is calculated to confer permanent benefits upon the children; not only as respects their improvement in learning and the comforts of civilized life, but also in promoting their moral and religious welfare; and that there are strong inducements to persevere in this benevolent work.

A letter from the Friend before alluded to, dated the 10th of last month, contains the following; "I feel most easy to say, that I think there is cause for encouragement for Friends to persevere in their labours of Christian love, for the improvement of these poor people. There remains a kind open feeling amongst them towards our Society; and what is more encouraging, is the precious evidence of Divine regard, which has, through unmerited mercy, been granted us."

In a letter from the Indians to the Committee, dated Tunessassah, Second month 28th, 1856, and signed by several of their principal Chiefs, they say; "We are glad that we are permitted to meet together to-day. We wish to speak a few words to our old friends, the Quakers. Many years ago, some of our old Chiefs, Cornplanter and others, visited President Washington. After some conversation, they inquired of him whether he had any good, honest people, whom he could recommend as being suitable to help and instruct the Indians. He said he had; that he could recommend the Quakers. Since that day the Quakers have been friends to the Indians. They have always given us good advice, and done much to help us. We wish you may not get discouraged; but continue to assist us, and advise our people. We feel thankful for your advice and wish to take it. We desire to do what we can to encourage our young people to habits of industry; to clear up their land and farm it; and to discourage all habits of immorality which we believe would be a disadvantage to our people. We often speak to our people on the subject of intemperance, and discourage the use of intoxicating drink amongst them, and have been trying to remove the article from our Reservation." The natives continue to give attention to their farming, and generally raise a supply of provisions for their families.

The high price of food and other circumstances, have increased the cost of maintaining the family at the school; so that the income at the disposal of the Committee is not sufficient to meet the current expenses. About $650 of the capital have necessarily been absorbed during last year; and there are still debts outstanding to nearly the same amount. If the school is supported, and its obvious benefits continued to the Indians, some additional means will be required; and we would suggest for the consideration of the Yearly Meeting, the propriety of opening voluntary subscriptions among its members, in aid of this benevolent object. It appears from the report of the Treasurer's account, that he had in his hands on the 20th ult., $55 24 in cash, and securities for $12,388.

Signed on behalf and by direction of the Committee. THOMAS EVANS, Clerk.

Philadelphia, Fourth month 18th, 1856.

Tyrant, Fly Catcher, or King-Bird.

MUSICAPA TYRANNUS.

This bird generally selects, for a place to build, an old apple-tree standing alone in some pasture skirted with wood, or on some hill-side, below which is a clear field, with a few trees or bushes thereon which will serve him for standing places; from these he sallies forth in pursuit of insects that pass and repass, turning to the right, then to the left, now rising in the air with quick vibrations of his wings, then, with hawklike motions, he skims the surface of the ground, seizing his prey at every turn he makes. Over such a field he holds supreme authority, and is a dreaded foe to blackbirds, crows and hawks; even the eagle daunts not his courage; for he no sooner perceives his coming than he lowers his body to the branch on which he stands, moves his head from one side to the other—raises his feathers—then launches forth to meet him, uttering, as he starts, his twittering notes; the eagle no more sweeps in circles to reconnoitre the field below, but starts on a direct course to rid himself of his pursuer—but it is in vain—the intrepid tormenter, rises above him, dives upon his back, rises again, and sweeps from side to side, while with velocity the eagles dives, then mounts almost perpendicularly to elude his hot charges; but such evolutions avail him nothing; he must leave the king-bird's precincts, or by alighting on some tall tree, when, with a few more swoops at this noble bird, the tyrant retires; and as he returns, hovering triumphantly to his place, you see his head move, as his eye follows the insects that he passes, first on one side, then on the other, until he sees one to his liking; he turns or rises, as the case may be, snaps him in his bill, returns to his place, strikes him a few times on his stand, and devours him; thus is he as merciless with his prey as is the eagle, with whom he disputes the right to hunt over the same field, and to every bird larger than himself, who dares intrude on his presumed rights, a teasing master.

For "The Friend."

On looking over some old manuscripts in my possession, I discovered a minute from the Yearly Meeting of Ministers and Elders, held in Philadelphia, in the Ninth month, 1787. And the Memorial of Advices, issued at London, in 1775, to which it refers.

After an attentive perusal thereof, I am impressed with the conviction, that they were originally given forth under the influence of that Divine authority, which was, at times, so freely meted out to our early Friends, and believing that some parts of them are well adapted to the situation of some in the present day, and that a renewed revival of them, after a lapse of so many years, would be beneficial, not only to some ministers and elders, but to many others also, I am induced to forward them for insertion in "The Friend." W. N.

New Jersey, Fifth month, 1856.

Abstract from the Minutes of the Yearly Meeting of Ministers and Elders, held in Philadelphia, for Pennsylvania, New Jersey, &c., in the Ninth month, 1787.

It being the sense of this meeting, that the revival of those pertinent and weighty advices issued by our brethren in London, at their Yearly Meeting in 1775, for the especial use and notice of ministers and elders, may tend to our improvement and solid instruction, it is therefore recommended to our several select Quarterly Meetings to promote the reading and considering them at such proper times and seasons as to them may appear most likely to answer the valuable purposes for which they were intended. The clerk of this meeting being desired to furnish each Quarter with an abstract of our minutes made on this occasion, and also with a copy of those advices.

Extracted from the minutes of said Yearly Meeting, by HENRY DRINKER, Clerk.

A memorial of some necessary advices recommended to ministers and elders as caution and counsel, in the love of the gospel.

1st. Against undue and restless behaviour, under the ministry of any Friend, whilst in the unity of the body.

2d. That all be cautious of using unnecessary preambles, and laying too great a stress on their testimony by too positively asserting a divine motion, and frequently repeating the same, seeing no such pretensions will obtain credit, where it is not manifestly so; and where it is, the baptizing power of truth, accompanying the words, is the best evidence.

3d. Against misquoting and misapplying the holy Scriptures; and it is desired that all those concerned be frequent in reading them.

4th. To be careful how they fall upon disputed points in their testimony, and making such objections as they do not clearly answer, and also against giving repeated expectations of coming to a conclusion, recommending the people, &c.

5th. Against hurting meetings towards conclusion by unnecessary additions, when the meeting was left well before.

6th. Against unbecoming tones, sounds, gestures and all affectation, which are not agreeable to Christian gravity.

7th. Against undertaking, or running into employments they have not knowledge or experience of, as some have done to their own hurt, the injury of others, and the reproach of their religious profession, but to employ themselves in business they are acquainted with, and to avoid an idle life.

8th. Not to speak against persons, or report things on hearsay, but to treat with the parties concerned, and thereby prevent sowing discord.

9th. That their apparel, and the furniture of their houses, their tables and way of living, may be with decency, moderation and temperance, that they be therein good examples to others.

10th. Against men and women's travelling as companions in service, to avoid all occasions of offence thereby.

11th. To beware of too much familiarity, tending to draw out the affections of one another to their hurt.

12th. That ministering Friends be careful not to hinder one another's service in public meetings, but every one to have a tender regard for others, that nothing be offered with a view to popularity, but in humility and the fear of the Lord.

13th. Against running in their own wills to disturb or interrupt any people in their worship, or presuming to prophesy in their own spirits against any nation, city, town, people or person.

14th. That ministers, when they travel in the service of Truth, be careful not to make their visits burthensome, or the gospel chargeable.

15th. That ministers and elders be careful to keep their whole conversation unspotted, being examples of meekness, temperance, patience and charity.

16th. And lastly, as prayer and supplication to God is a special part of his worship, it must be performed in spirit, with a right understanding, seasoned with grace. Therefore, let ministers be careful how and what they offer in prayer, avoiding many words and repetitions, and not to run from supplication into declaration, as though the Lord wanted information, and let all be cautious of too often repeating the high and holy name or his attributes in a long conclusion, neither let prayer be in a formal and customary way to conclude a meeting, without an awful sense of Divine assistance, attending the mind.

For "The Friend."

Prospects of the Jews in Palestine.

Our readers are aware that in the spring of 1854 a touching appeal was made in London, as elsewhere, to good-hearted people of all faiths, to save the remnant of the Jews in Palestine from perishing by famine. The appeal was responded to, and in Second mo., of last year a report was published by the chief Rabbi in London and Moses Montefiore, the Trustees of the Relief Fund, detailing the methods in which relief had been administered. Their second report appeared recently, and the London *Daily News* gives the following outline of its contents.

"Moses Montefiore and his lady, and a few friends, went out to Palestine in May last. The Sultan and his Ministers at Constantinople granted all that was asked in furtherance of the main object of the Trustees—the establishment of industrial pursuits in Palestine, and especially of tillage of the land. A Jew, introduced by Christian dignitaries to a Mussulman potentate, and going from the regal presence with protection—and, above all, protection to agricultural industry—in his hand, is a new spectacle in the world. Less novelty there was in M. Montefiore's painful discovery, on reaching Jerusalem, that he was looked for as an infallible deliverer 'many having supposed that Moses had the power to relieve from every ill, and to provide for every want.' This was likely to happen with an Eastern people, looking for special intervention on all occasions; and with a people habitually sustained by alms, who conclude it to be everybody's business 'to provide for every want' they are subject to. Moses and his friends had two objects however, of which alms-giving was the first in pressure, but not in importance. They relieved the existing hunger; but they were even more anxi- to cut off the sources of distress—to induce people to depend on their own industry, and not European or American alms. In the consultati- held at Jerusalem, with representatives from other three holy cities, there was what appears us, with our biblical notions of Jewish proceedin a curious mingling of topics. The Needlewom- Association and the Lying-in and Loan Societ- were discussed, examined, and approved; a Gi- School was detemined on; and then came in the imagery of the vine and the fig-tree, the placing landmarks, and the gathering together of flo- and herds. Under the advice of practical agric- turists, convened in council, land was bought, which thirty-five families from Szaffad were pla- ed in one place, and thirty from Tabarea in anoth- and others again from Hebron, and others fr- Jaffa. BIOGRAPHICAL SKETCHES,

Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

MARMADUKE COATE.

(Continued from page 277.)

Their address ran thus:

"To Chief Justice Herbert and Judge Wright, igned to hold assizes and gaol delivery, for the estern Circuit at Wells, for the county of Somer- the thirtieth of the month called March, 1686.

"Several of the people called Quakers, now pri- ers in the gaol at Ivelchester, in the county of nerset, on behalf of themselves and many others he same people, in humility, show,

"That since the Wise Disposer of all things, hath ered your employment in this honourable service, relieve the oppressed, and deliver the captives; l since king James II., that now is, hath com- ted part of his clemency to your custody, to dis- pute the same, according as the Lord hath in- ned his heart; and having taken particular no- e of our sufferings, and signified his will and easure, that we, the people commonly called akers, should receive the full benefit of his gen- l pardon, with all possible ease; which grace d favour we, with all thankfulness, acknowledge God as the Chief Author, who hath the hearts king's at his disposal; and to the king, as being dy herein to mind that which the Lord inclined heart unto, and not without hope, to find the e opportunity to render to you our hearty thanks, the full accomplishment of that which our God ows, and the king so readily grants us: and also aring the report of your nobility and moderation, managing this weighty trust committed to you, are emboldened thus to address ourselves, ough in plainness of speech, yet in sincerity of art, to lay before you, that we have for several ars been prisoners in the gaol aforesaid, not for y plotting against the king or government, or rm done to his subjects. Our peaceable lives ve manifested our fidelity to the king, and love our neighbours; it being contrary to our prin- ples to do otherwise, but only for conscience' ke, because in obedience to Christ Jesus, we dare t swear at all, or forbear to worship God, as he ath ordained, nor conform to those worships which e have no faith in; which, to omit the one, or ractise the other, we should thereby sin, and so ound our consciences, and break our peace with od; and what good then should our lives do us, we might enjoy never so much of the world's avour and friendship.

"Our humble request, therefore, to you is to onsider and compassionate our suffering condition, nd improve the power and authority that God and he king hath entrusted you withal, for our relief nd liberty; we still resolving and hoping, through God's assistance for the future, to manifest our fear o God, honour to the king, and honesty to all his ubjects, by our godly, humble and peaceable con- ersation. The particular causes of our imprison- nents are herewith attested, under our keeper's and. And we further pray, that mercenary in- ormers and envious prosecutors against us only or conscience' sake, may, according to your wis- lom and prudence, be discouraged from prosecut- ng such actions, by which many industrious and conscientious families and persons are in danger of being ruined; and we encouraged in our diligence, in our respective callings, and may enjoy the bene- fit of our industry; and so shall we be the better enabled to perform with cheerfulness the duties we owe to God, the king, and all men. The Lord guide you in judgment, and more and more incline your hearts to love mercy, and do justice, and grant you the reward thereof; which is truly our desire and prayer."

The names of the prisoners, the cause, with the period of their confinement, are then given. Marmaduke Coate's imprisonment for tithes is noticed as fifteen years and five months. The prisoners were released, but Marmaduke Coate did not long survive his liberation. In the year 1689, when the demand for tithes against his estate was made, his widow, Edith Coate, and his son Marmaduke were prosecuted, and committed to prison. The period of their confinement, we know not.

About the beginning of 1700, Marmaduke Coate was married to Ann Pole, a daughter of Edward and Mary Pole, of Bustlehay, in Somersetshire. At what period they removed to America, I have not been able to discover, but they settled in Burlington county, New Jersey. They both became useful members of that meeting, and were both members of the meeting of ministers and elders. He was an elder, and she either stood in that capacity, or in that of a minister. Of their son, William, we shall have further to note.

Marmaduke Coate, having lived honoured and respected, deceased the 15th day of the Twelfth month, 1729.

THOMAS WICKERSHAM.

Thomas Wickersham, of Bolney in Sussex, Great Britain, was a man in good repute amongst Friends there. He was a member of Horsham meeting, from which, in 1700, when he removed to Pennsylvania, he brought a certificate of membership, which testified that he was "an honest man," and "in unity with faithful Friends." He was one of the first settlers in Marlborough, Chester county, and became a member of Kennett Particular Meeting, and Newark Monthly Meeting. He was a man growing in the Truth. His friends say of him, "His care in attending meetings for worship and discipline was remarkable, and worthy of imitation." In the year 1714, he was appointed an elder, but he was under exercise and preparation for other service in the church, and in the year 1718, a dispensation of the gospel ministry was committed to him. His ministry, his friends say, was mostly "seasonable exhortations to faithfulness." It was generally "well received," "being in the simplicity of Truth, his conversation agreeing therewith." "He retained his integrity to the Truth till the last, and died in a good old age, at his own house, in the Fourth month of the year 1730, and was buried in Kennet burying ground."

MARY JACOBS.

Of this ministering Friend whose residence was at Little Egg Harbour, and who deceased there, Seventh month 22d, 1730, "in full unity with her friends," we have the following character: Her "testimony was to edification, and comfortable to those whose minds were inwardly gathered; and to the stirring up the minds of the careless and unconcerned. Her life and conversation was answerable to her doctrine."

JANE OSBORN.

Jane Osborn, of Little Harbour, "was a zealous and faithful elder, and serviceable in the church." She departed this life on the 29th of the Seventh month, 1730, in unity with her friends.

ELIZABETH MATHER.

Elizabeth Mather, the widow of Joseph Mather, of Abington Particular Meeting, was a minister of the gospel for a number of years, in good esteem. She was a serviceable member of the religious Society she belonged to, and was employed in its concerns. Her friends inform us her testimony was well received, and that she was of an innocent life and conversation. She died in the Ninth month, 1730.

(To be continued.)

For "The Friend."

Extract from a letter to a Friend.

The time was, when those who stood for the Master's name and cause, knew something of a continual partaking of the bounties of his table; but oh! how changed are things now—the city of our fathers lieth waste and the gates thereof are burned with fire, and there seemeth none to come up and help to restore the waste places, and rebuild the walls that have fallen down. And the watchmen, and the watchwomen, what of them? the few that are left may be seen walking solitary and sad, with their eyes bent to the ground, having as it were sackcloth underneath upon their loins, and they can only say, "Spare thy people, Oh Lord, and give not thy heritage to reproach," while leanness and fasting have entered into their souls; and those who would come to their aid, find they have but a little handful of meal in the barrel, and so small a portion of oil in the cruise, they have not faith enough to use it, for fear it will never be replenished. How many of us need more faith, more trust, more confidence in Him, with whom are all the issues of life: there are times (and these are my better times) when amidst all my weakness, and stumbling, and starting aside, I can see plain enough our compassionate Father waiteth to be gracious to many, very many, both within and without the pale of our society, and He would that they should be gathered to the one fold and the one shepherd. I have often thought of George Fox, when his horse's feet trod on Scottish ground, he saw "there was a seed thickly strewn there," that needed but little pruning and watering to prepare it for the harvest; would not the dispensation be a glorious one, and what cause for rejoicing would it be, could but mine eyes see, before they are closed upon this world, sons and daughters coming from far; enquiring their way to Zion with their faces thitherward; then indeed, might we write, "the church cometh up from the wilderness, leaning upon her beloved, fair as the moon, clear as the sun, and terrible to the man of sin, as an army with banners." We know not what may be in store for us, and it was once said, "I will give thee the valley of Achor (or trouble) for a door of hope:" all who feel that our beloved society has entered into that identical place, have some right to trust, and hope, and hope on, that the low and distressing spot we are in will not be without an end; and this dispensation of Achor, (which is the fruit of a long course of unfaithfulness, and serving the gods of the children of the land among whom we dwell,) will have its limits; and though the prospect of there being those coming up from among the younger ranks who will arise and build, is so faint, that all hands seem feeble, and all knees weak as water, yet strength *has been* made perfect in weakness; and grace has lifted from the hole of many a dark pit, sons and daughters, and made them as stars in the firmament of the Redeemer's kingdom, which shall go no more out: all this comes through obedience; faithful obedience to the manifested will of our Creator, which neither Jew nor Gentile can say in the day of final reckoning, he has not known. All have known it, but all have not given heed unto it as fully as they should; and I fear some under our name have disregarded it altogether, and would beguile their brethren and their mother, the church militant, into the notion that such manifestations are only a delusion; the creature of man's erring

imagination. I am not surprised at this being a taking doctrine with many; it leaves the path to everlasting rest so open, so easy of access, and so unguarded,—so out of the reach of that sword which turns every way, to keep the way of the tree of life,—that we might live very much as suited our tastes here, and hope to enter in with the bridegroom, without experiencing much of that new birth, of which our blessed Saviour told Nicodemus.

Second mo., 1856.

For "The Friend."

William Dewsbury.

(Continued from page 275.)

The early life of William Dewsbury shows the fervent desire, which filled his mind, to attain to that knowledge of God, which is life eternal. Our Saviour declared that "no man knoweth the Son but the Father; neither knoweth any man the Father save the Son, and he to whom the Son will reveal him." Again, "no man can come to me, except the Father, which sent me, draw him." From these declarations, it is plain, that there is no way to know God, but by the revelation of the Son, which is through the illumination and the work of his Holy Spirit upon the heart. This divine revelation was little regarded or believed in at the first appearance of Friends. But many sincere seekers after the effectual means of salvation from sin, when they heard the message concerning the internal manifestation of Christ Jesus, as "the way, the truth and the life," without whom "no man cometh to the Father," and that through obedience to his will, made known by his light and grace in them, they would be made conquerors of sin and temptation, received the truth in the love of it, and heartily joined in fellowship with those messengers of the gospel.

Until the thirteenth year of his age, W. Dewsbury's occupation was chiefly that of a shepherd's boy, and Allenthorpe continued to be his home. This retired situation and way of life, appear to have been very congenial with the state of his feelings; as it relieved him from the interruptions of company, and afforded him an opportunity of indulging in secret meditation, and in mourning and breathing after the saving knowledge of God. But soon after this period, when his relations were thinking of putting him apprentice to learn some trade, he heard of a people called Puritans, near Leeds, thirty miles from the place of his birth, who were said to fear the Lord, and to walk with greater strictness of religious profession, than many with whom he had been acquainted. Such was his hunger and thirst after righteousness, that he had no rest in his spirit, until his parents, (his mother having probably married again,) had succeeded in procuring a place there for him; not at all regarding the nature of his employment, "if," says he, "I might be among those who feared the living God, and thus become acquainted with the God of my life, who created me for himself." He was accordingly bound apprentice to a cloth weaver at Holdbeck near Leeds, who proved to be a very sharp master; but the Lord enabled him with much patience to endure his trials, attended as they were by ill health, until the period of his apprenticeship was nearly expired. In the meantime he continued to use all diligence in seeking that knowledge for which his soul was greatly athirst, and for want of which he suffered much distress of mind. He attended assiduously at the preaching of all the chief teachers of religion in the neighbourhood, wrote down their sermons in short-hand, and went afterwards to their houses to discourse with them, that, if possible, he might gain some satisfaction as to the subject of his anxiety. But in this he found himself disappointed; the result proving to him, that no outward profession of religion however high, no knowledge of Scripture however complete in itself, no attention to religious observances however strict, could ever cleanse the soul from sin, or restore it to a state of acceptance with God. "He wanted Christ," the chief of ten thousand, the beloved of souls, "and without him he could not live."

Speaking of this serious people about Leeds, and his disappointment in not finding among them that aid in the work of salvation, which he so ardently longed for, W. Dewsbury says, "There was as had been reported, much speaking of God, called preaching, and professing him in words from the letter of the Scriptures, what the saints had spoken forth, thus imitating the saints' practice in a carnal wisdom, and seeking the kingdom of God in outward observations, as I had done before I came there. But *I met with none who could tell me what God had done for their souls, in redeeming them from the body of sin*, which I groaned under, and which separated me from the presence of God. Although I walked strictly with them in the outward observations, and in running to hear one man after another, called ministers, yet I found no rest nor peace to my weary soul. The flaming sword, the righteous law of God cried in me for a perfect fulfilling of the law, and met me wherever I was; so that I could find no peace in that worship of God the world had set up—such as receiving the bread and wine, which they told me were the seals of the covenant. It was long ere I dared to receive them, because I saw not myself prepared; for the evil of my heart stood before me. And when I was about to receive them, I sought the Lord to keep me by his power, that I might receive them worthily; and when I did receive them, my desire was, that the Lord would seal up his will to my soul, but I found nothing sealed to my soul therewith. Then much fear seized upon me for a long time after; and the condition of Judas was cast into my mind; until it was showed me that the seal of the covenant was the Spirit of Christ, and no outward element; and that the supper was the body and blood of Christ, which the world doth not know, nor did I at that time, but I was made to wait for the manifestation of it to me."

"Then I durst join no more with the world in that practice; nor in singing David's conditions, which they called singing psalms. For the light in my conscience let me see the evil of my heart, that I was not in David's condition, the sense of which stopped my mouth; and while others were singing, I mourned and wept for want of the pure spirit that David had, and which caused him to sing. Neither was I able to apply the promises, which they told me belonged to me, for I found no promise belonging to that nature; but the wrath of God abode upon me, for my disobeying his counsel in me, the light in my conscience. But being ignorant that it was his counsel, I departed from it and lent my ears to those who said they spoke from the mouth of the Lord. And I was deceived, and thus caused to err by their lies, who drew me to seek the kingdom of God in observations without. But the word of the kingdom was in me, and executed the righteous judgment of God upon my adulterous heart, that took counsel, and not at his mouth."

Under these exercises of mind, William Dewsbury's health gave way, and he became so weak as to be unable, with all his efforts conscientiously exerted, to answer the expectations of his master; who, thinking him to be in a consumption, was inclined at one time to send him home to his relations; but on further reflection, he judged it to be more prudent to take medical advice. W. Dewsbury, however, being fully aware of the real cause of his malady, and rightly concluding that it was no other than the evil of his own heart, and the distress of mind thence arising, resolutely declined employing such means for his relief, with a solitary exception to avoid giving offence. When after diligent search among the Puritans, he was unable to find any who could apply a remedy to his spiritual malady, he was constrained to make his case known to such as were esteemed in the world as the most experienced ministers and professors, and to ask them what he might do to be saved. But they also proved to be physicians of no value, mere ministers of the letter. They told him to believe in the name of Christ, and to apply the promises; but to wait for "the revelation of Jesus Christ" in his own heart, they neither counselled him; and it only added to his sorrow to be thus urged to believe in Christ, when neither he at that time, nor his advisers, knew where he was to be found, nor how to be believed in, to the saving of the soul.

Those who were thus brought to hunger and thirst after righteousness, and could not be satisfied without it, in the Lord's way and time, were filled. They were made believers in Christ, through the faith which is of the operation of his Spirit in the heart, and by taking up the cross, denying self and following him faithfully, they became changed men, born of the Spirit, and were brought to hold communion with God, in the temple of a sanctified heart. As in the primitive Christian church, the Spirit divided to every living member severally, the gifts which he was to occupy in the body, so they were prepared, and received gifts to exercise for its edification and their own growth in the truth. We have been long contending against unsound doctrine, first on one hand, and now on the other, which it has been our bounden duty to oppose and expose. Is it not important to pause and inquire of the Lord, what is his will concerning the Society in this respect, now a plain decided testimony has been borne nearly ten years on this matter? May not the cunning serpent deceive many, if they are not upon the watch-tower, and lead them to make their religion to consist in talking on doctrine, instead of feeling the daily hunger and thirst after righteousness, that our own souls may be filled, and a constant growth experienced in the life and power of Truth, and in the love and fellowship of the gospel, praying for ourselves and for one another.

(To be continued.)

For "The Friend."

The testimony that was borne by our late Yearly Meeting, against the spirit of separation, and the disposition that was manifested on the part of some, patiently to suffer, rather than to do anything tending to compromise that testimony, were truly encouraging to the trembling disciples of the Lord Jesus Christ, who signally manifested himself to be the head of his own body—to be both wisdom and strength to those whose trust and confidence are in Him—to be the helper and deliverer of his people.

The truth is mighty, and the wisdom and policy of men shall never be able to prevail against it, however speciously they may work, either on the right hand or on the left. No weapon formed against it shall ever prosper, but the humble, self denying, cross-bearing followers of the Lamb of God, who taketh away the sins of the world, shall ever have the victory.

The Lord hath not left himself without a witness, and however despised this may be in the eyes of the worldly minded professors of Truth, it does, and will testify, against all the works of darkness wherever, and in whomsoever they may appear. The

k will the Lord guide in judgment, and the hum- will he teach of his ways; as it is written, "The st of the Lord is with them that *fear* Him;" these have bread to eat that the world knows of; for it is their meat and their drink to do to suffer the will of their heavenly Father, out regard to the judgment of men, who may em them fools, and the followers of their own vision.

he holy apostle, in one of his epistles to the hthians, exhorts in this wise; "Let no man ive himself. If any among you seemeth to be in this world, let him become a fool, that he be wise; for," said he, "the wisdom of this ld is foolishness with God; for it is written, He th the wise in their own craftiness." And he ured them that it was a very small thing that he uld be judged of them, or of man's judgment; a," said he, "I judge not mine own self; for I w nothing by myself; yet am I not hereby ified: but he that judgeth me is the Lord. refore," said he, "judge nothing before the e, until the Lord come, who both will bring to t the hidden things of darkness and will make nifest the counsels of the hearts, and then shall ry one have praise of God."

How would it become us who are professing the h of the ancient prophets and apostles, to follow r example of patience and meekness under ering, to the denial of self in all things; not king honour of men, or to be delivered from ering, before it shall please Him who is head r all things to his church, to pronounce, "It is ugh;" for it is declared that if we suffer with rist, we shall also reign with him. The promise o those who endure to the end; to those who de with Him in his temptations, enduring hard- s as good soldiers, for his sake; who is the head his own body, which is made up of spiritual mbers gathered out of every nation, kindred, gue and people; and who will not permit any of testimonies, given us as a people to bear, to fall the ground.

Let us not be too much alarmed, neither let us dismayed on account of our trials, as though e new thing had happened unto us; for it has n the experience of the church from the earliest iod, to be brought under suffering on account of sies and false brethren; and it is written that nces must come; but the wo is pronounced upon se through whom they come, and not upon those o keep their habitations in the Truth, contending inst them. These have nothing to fear from e arrow that flieth by day; nor from the pesti- ce that walketh in darkness; nor from the des- ction that wasteth at noon-day; but though a usand shall fall at their side, and ten thousand their right hand, it *shall not* come nigh them. ey shall tread upon the lion and adder: the ng lion and the dragon shall these trample under ir feet, and no plague shall come nigh their elling, because they have set their love on Him o is able to deliver them, and he will set them high, because they have known his name. They ll call upon him and he *will* answer them, and ll be with them in trouble, and will deliver them, d honour them, and show them his salvation."

If we suffer for well doing, let us seek patiently bear it, but let us endeavour to avoid suffering as il doers, for thus our patience will be without its ward.

Never assent merely to please others. For that besides flattery, oftentimes untruth, and discovers mind liable to be servile and base: nor contradict vex others, for that shows an ill temper, and ovokes, but profits nobody.

Epistle of George Fox.

Friends being now grown very numerous in the northern parts of the nation, and many young convinced ones coming daily in among us, I was moved of the Lord to write the following epistle, and send it forth amongst them, in order to stir up the pure mind, and raise a holy care and watchfulness in them over themselves, and one another, for the honour of truth:—

To you all, Friends everywhere, scattered abroad. In the measure of the life of God, wait for wisdom from God, even from Him from whom it comes. And all ye, who are children of God, wait for living food from the living God to be nourished up to eternal life from the one fountain, from whence life comes; that ye may all be guided and walk in order; servants in your places, young men and women in your places, and rulers of families; that every one, in your respective places, may adorn the truth, in the measure of it. With it let your minds be kept up to the Lord Jesus, from whom it comes, that ye may be a sweet savour to God, and in wisdom ye may all be ordered and ruled;—that a crown and a glory ye may be one to another in the Lord. And that no strife, bitterness, or self-will, may appear amongst you; but by the Light in which is unity, all these may be condemned. And that every one in particular, may see to, and take care of the ordering and ruling of his own family; that in righteousness and wisdom it may be governed, the fear and dread of the Lord being set in every one's heart; that the secrets of the Lord every one may come to receive, that stewards of his grace, you may come to be, to dispense it to every one as they have need; and so in savouring and right discerning you may all be kept; that nothing that is contrary to the pure life of God may be brought forth in you, or among you; but all that is contrary to it, may be judged by it; so that in light, in life and love, ye may all live; and all that is contrary to the light, and life, and love, may be brought to judgment, and by that light condemned. And that no fruitless trees be among you, but all be cut down and condemned by the light and cast into the fire; so that every one may bear and bring forth fruit unto God, and grow fruitful in his knowledge, and in his wisdom; and that none may appear in words beyond what they are in the life that gave forth the words. Here none shall be as the untimely figs; none shall be of those trees whose fruit withers; such go in Cain's way, from the light, and by it are condemned. Let none amongst you boast yourselves above your measure; for if you do, out of God's kingdom you are excluded; for in that boasting part gets up the pride and the strife, which are contrary to the light that leads to the kingdom of God, and gives an entrance thereinto, and an understanding to know the things that belong to the kingdom of God. There the light and life of man every one receives, even Him who was before the world was, by whom it was made, who is the righteousness of God, and his wisdom; to whom all glory, honour, thanks, and praise belong, who is God, blessed forever. Let no image or likeness be made; but wait in the light, which will bring condemnation on that part that would make the images; for that prisons the just. So to the lust yield not the eye, nor the flesh; for the pride of life stands in that which keeps out the love of the Father; and upon which his judgments and wrath remain, where the love of the world is sought after, and a crown that is mortal. In this ground the evil enters, which is cursed; which brings forth briars and thorns, where death reigneth, and tribulation and anguish are upon every soul, and the Egyptian tongue is heard; all which is by the light condemned. There the earth is, which must be removed, by the light it is seen, and by the power it is removed, and out of its place it is shaken; to which the thunders utter their voices, before the mysteries of God be opened, and Jesus revealed. Therefore all ye whose minds are turned to this light, wait upon the Lord Jesus for the crown that is immortal, and that fadeth not away. 1653. G. F.

Life is a wasting thing; it is a candle that will burn out.

THE FRIEND.

FIFTH MONTH 17, 1856.

In our present number will be found the Report of the Committee having charge of West-town Boarding School, and that of the Committee for the gradual Civilization and Improvement of the Indian natives, presented to our late Yearly Meeting. We wish to call the attention of our readers particularly to the latter, inasmuch as it states the necessity existing for an increase of the funds at the disposal of the Committee, in order to carry out the plan of a boarding school for the Indian children, authorized by the Yearly Meeting two or three years ago. The proposition to open voluntary subscriptions having been approved by the Yearly Meeting, we understand the Committee have had a sufficient number of subscription papers printed to be distributed throughout the subordinate meetings, and they will probably be presented to the members at an early day.

The remnant of the Seneca tribe residing at Tunessassah has long been under the care of and received assistance from Friends of Philadelphia Yearly Meeting. In former days, many members of the committee to whom the subject was entrusted, underwent much exposure and hardship while visiting or remaining among them, and much labour and a considerable amount of money have been expended in the efforts, continued from year to year, to induce them to give up the manners and prejudices inherited from their forefathers, and adopt the habits and comforts of civilized life. It is true, that for a long time there seemed to be but little permanent improvement effected—not much good fruit to compensate for the outlay, and encourage to unrelaxed labour in the course marked out—and yet the Indians always evinced a correct estimate of the disinterested feelings by which Friends have been actuated, and a grateful sense of the benefits designed to be conferred upon them; while it was from time to time apparent, that individuals of them brought under the immediate influence of the School kept up, and the family of Friends stationed in the reservation, were decidedly softened in their feelings, and enlightened by it, and thus, perhaps insensibly to themselves, were instrumental in slowly promoting the improvement of their tribe. It is a remarkable fact, that while other remnants of tribes in different parts of our country have been gradually but continuously dwindling away, and in several instances have become extinct, these Indians under the care of our Yearly Meeting have for several years been on the increase, and are becoming more numerous from year to year. Within the last few years the improvement among them has been very marked in several ways, and perhaps no better evidence of it can be given, than the general and growing desire to have their children educated. Although agents for other religious Societies find their way among them, yet they manifest a decided preference for Friends, and are anxious for them to have the charge of their children; so that if the means were at command to pay for teachers

and the necessary increase of assistance in the family, there is reason to believe pupils enough to fill a large school could be easily obtained. The Boarding School is found to fulfil the expectations with which it was established, bidding fair, by the religious and moral training combined with literary instruction, to make a lasting impression on the rising generation, and prepare them to become intelligent and useful members of the community.

There is an acknowledged obligation resting upon us all, to act a kind and liberal part towards the few remaining representatives of the once powerful tribes that held possession of this country when our forefathers landed on its shores, and in no way can that obligation be more satisfactorily met, than by securing to them and to their offspring the opportunity for obtaining religious and mental culture; that so a knowledge of their duties and responsibilities, with a preparation to perform them, may go hand in hand together.

We trust that the Committee will be encouraged to persevere in their labours by a liberal subscription from the members in all parts of the Yearly Meeting.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 26th ult.

The Dispute with the United States.—The London Morning Star says, "We are told, that at the meeting of the Cabinet, on Tuesday, the 22d, at which Lord Clarendon was present, for the first time since his return from Paris, the answer to the United States was agreed upon, on some of the points connected with the Central American question. The British government are prepared to give way, but they will not recall Mr. Crampton, and they are also prepared to communicate to the United States government, that they are unanimous in their determination to continue him in his present position, as British Minister at Washington."

The Treaty of Peace.—The terms of the Treaty are to be substantially such as were anticipated. The Treaty is republished by the London Sun, surrounded by a mourning border. The stipulations respecting Moldavia and Wallachia, appear to aim at making those Principalities ultimately independent of Turkey. Though nominally under the Sovereignty of that power, it is designed that they shall enjoy greater civil and religious freedom, and a constitution in accordance with the wishes of the people. If the internal tranquillity of the Principalities be disturbed, the Porte must consult the contracting powers, and cannot employ armed intervention without their consent. Russia cedes a small portion of Bessarabia, which is to be annexed to Moldavia. No part of the Russian territory will hereafter border on the Danube, and the free navigation of that river is provided for.

FRANCE.—An imperial decree has been issued, ordering a further reduction of the army. In a late sitting of the *Corps Legislatif*, Montalebert made a remarkable speech on the freedom of the election franchise, and denounced the Court of Cassation as an accomplice with the Government to render universal suffrage a mockery, and called for an alteration of the law. The late heavy rains had caused inundations in many parts of France. The Moselle newspaper announces an important fact—the discovery of coal in apparently large quantities, and of good quality, in several parts of that department.

RUSSIA.—Count Orloff has been appointed President of the Council of State. The militia have disbanded. The Admiralty have ordered all the light-houses to be lighted, and all the buoys to be laid down in the Gulfs of Bothnia and Finland, and the Baltic and White Seas. The Emperor has been on a visit to Moscow. In his speech to the city authorities, he said, "The war is over; for I ratified the treaty of peace which had been signed at Paris before I left St. Petersburg. I am happy to be able to announce the news to you officially, and to repeat to the nobility of Moscow the words which I addressed to my people in my last manifesto. Russia was able to defend herself for many years to come, and I believe that no matter what forces were brought against her she was invulnerable on her own territory. But I felt that it was my duty, in the real interests of the country, to lend an ear to proposals compatible with the national honour. War is an abnormal state, and the greatest successes obtained by it scarcely compensate for the evils it occasions."

TURKEY.—The French have evacuated Kinburn. Great sensation had been caused in Constantinople by the Sultan having paid a visit to the Greek patriarch; an act heretofore unexampled.

GREAT BRITAIN.—On the 23d, there was a grand review of the British fleet at Spithead, at which more than 100,000 spectators were present. The fleet numbered over 240 ships of war, including steamers carrying 3000 guns and 33,000 men. The fleet formed four squadrons, and extended twelve miles over the water. In the British Parliament the government sustained another defeat, having been out-voted by a majority of 28, in favour of open competition for civil appointments. Lord Lyndurst has given notice of a motion inquiring into the condition of Italy. Lord Malmesbury has given notice of his intention to move a vote of censure in relation to the fall of Kars. A vessel discharging a cargo of Cuban sugar at Greenock, brought two slaves who secreted themselves on board the ship while she was lying at Cardenas, and who were not discovered until she had been several days at sea.

Liverpool Markets.—Cotton had been active during the week, at an advance of ¼d. Sales of the week, 98,000 bales. The stock of American in port was 368,000 bales. Breadstuffs had slightly advanced. Western Canal flour, 26s. to 32s.; good Ohio, 35s. a 35s. 6d.; red wheat, 9s. 6d., and white, 10s. 6d. per 70 lbs.

The London Money Market was easier. The bullion in the Bank had decreased £222,000. Consols, 92¾ or 93.

BRAZIL.—Advices from Rio Janeiro to Third month 17th, state that the cholera was prevailing there, but not with great severity. The total number of deaths from that disease, had been 5552, the majority of whom were slaves.

UNITED STATES.—*Congress.*—A bill has passed both Houses, giving a million and a half of acres of land to Iowa, to aid in the construction of railroads, and another appropriating $45,000 for deepening the channel over the St. Clair Flats, Michigan. In the Senate, the Committee on Patents have reported a bill amendatory of the Patent Laws, the object being to protect the public against the oppressive use of invalid patents, and inventors from the piracies of dishonest infringers. There is a misunderstanding between the two Houses, respecting the Deficiency bill. Two Committees have been appointed on the part of each body to confer, and both have disagreed. The principal difficulty relates to two amendments introduced by the Senate, appropriating $1,800,000 for the army, and $300,000 to the Washington Water-works, which the House is unwilling to sanction. At the request of the Senate, a third committee has been appointed.

Kansas.—The Congressional committee of investigation was in session at Lawrence. The U. S. troops under Col. Sumner had arrived. The Deputy Sheriff of Douglass county having writs issued for the arrest of about one hundred citizens of Lawrence, charged with the commission of crimes under the territorial laws, the army will be stationed at Lawrence until the arrests have been made, and the parties sent to Lecompton.

Philadelphia.—Mortality last week, 191. The mean temperature for the Fourth month was 53.36 degrees which is 1¾ degs. above the average of the last thirty years. The amount of rain was 3¼ inches. On the 8th, the steamer City of Baltimore arrived from Liverpool, whence she sailed on the 23d ult. It is expected that the other steamers of the line will follow in regular succession. The City of Baltimore is said to be the largest vessel ever in the Delaware; she is 347 feet long; 2464 tons, and her engines, of 500 horse power. Her passengers were 208 in number.

New York.—Mortality last week, 364. In 2502 dwellings recently visited by the Health Wardens and Inspector of the City, it was found there were 7301 families residing, composed of 36,508 persons, of whom 24,045 were adults. In 1592 houses were found more than four families each. More than 1000 persons were found to occupy a row of seventeen houses.

The Growth of Commerce.—In the year 1830, the tonnage of American vessels was 1,191,776 tons; the number of seamen and watermen under the American flag, including those in the navy, a little over 90,000. In 1855, twenty-five years afterwards, the tonnage increased to 5,212,000 tons, and the number of seamen to nearly 400,000, both having more than quadrupled in one-fourth of a century.

Pennsylvania Railroad.—The receipts upon this road during the Fourth month, amounted to $610,969, or more than a quarter of a million, in excess of the corresponding month, 1855. Since the first of the year, the receipts of the road have been $1,727,709.

Miscellaneous.—Mormon Emigrants.—The ship Enoch Train, from Liverpool, landed last week at Boston five hundred and thirty of these deluded people, all bound for the "land of promise," Utah.

A Coloured Slaveholder.—A correspondent of the [illegible]varmah (Geo.) News relates the case of William Ellis, a negro, who purchased his freedom from his master, and is now a large slaveholder himself. Ellison is said to own an extensive cotton plantation, and about one half of the town of Statesburg, in Sumpter district, S. C.

Emancipation of Slaves.—By the will of James Kelly, of Lancaster county, Virginia, all his slaves, about forty-five in number, have been emancipated. Provision is also made for their outfit and transportation to Liberia.

A Successful Voyage.—The ship Abigail recently arrived at New York, from a whaling voyage, having been absent forty-four months. The value of the oil and whale-bone taken during the cruise, is about $195,000.

The Smallest Bank in the United States is the Bank of Cayuga Lake, at Painted Post, N. Y., with $10,000 capital.

Norwegians in Wisconsin.—The Madison (Wis.) Journal learns that the Norwegian population of Dane county amounts to 6628 persons. They constitute the majority of the inhabitants in several of the towns, and are industrious and good citizens.

More Light.—The cities of Buenos Ayres and Rio Janeiro are now lighted by gas.

Railroad Iron.—The total consumption of railroad iron in the United States, for the last five years, is stated at 1,643,629 tons, of which 1,143,629 tons were imported. In 1855, our home establishments furnished more than half of the annual supply.

Land Monopoly.—Five noblemen are said to own about one-fourth of all the landed property in Scotland. They are the Marquis of Breadalbane, and the Dukes of Argyll, Athol, Sutherland, and Buccleugh.

Humboldt and the Table Rappers.—Baron Humboldt has written a letter to the New York Post, in which he emphatically contradicts the report that he had become a convert to the spirit-rapping humbug. He says he is a "holy horror of pine wood spiritualism and psychographic mysticisms."

RECEIPTS.

Received from David Ball and Wm. Pickets, O., $[illegible] each, to 32, vol. 30; from A. Hampton, Ind., $2, to 3[illegible] vol. 30; from Amy C. Hoopes, W. C., Pa., $2, vol. 2[illegible] from Stephen Hobson, agt., O., $2, vol. 30, and for Tho[illegible] Hobson, $4, vols. 29 and 30.

MARRIED, at Friends' Meeting-house, in Fall River, Mass., on the 7th inst., CHARLES E. HILL, of Philadelphia, to SUSAN F., only daughter of the late John Wilbur, [illegible] of the former place.

——, at Friends' Meeting, Arch street, Fifth-day, 8th inst., JOSEPH TAYLOR, of Greensburg, Pa., to MARY W. BOSTWICK, daughter of the late John Bostwick, [illegible] Ulster county, N. Y.

DIED, on the 22d of Fourth mo., last, SARAH DARNELL, aged 87 years; a member of Chester Monthly Meeting, N. J., formerly of Tukerton, N. J.

——, on the 2d inst., at his residence, Pennsville, Morgan county, Ohio, aged 49 years, JOHN PENROSE; [illegible] esteemed member of Pennsville Monthly Meeting. His sickness was of several weeks' duration, during which he suffered much, and patiently endured what his heavenly Father permitted to come upon him. His friends have a consoling belief, that having submitted to the cleansing, sanctifying baptism of the Holy Spirit, his [illegible] deemed spirit has been permitted, through the mercy of God in Christ Jesus, to enter into rest.

——, near Newby's Bridge, Perquimans Co., N. C., on the 3d inst., after an illness of three and a half days, ELIZABETH, wife of David White; a worthy elder of Piney Woods Monthly Meeting of Friends, in the sixty-eighth year of her age. Her disease quickly deprived her of the power of expressing her feelings, but the remembrance of her consistent and unobtrusive course as a Christian faithfulness is truly comforting to her surviving relatives and friends, who feel a lively hope, that her spirit is, through mercy, admitted into the realms of everlasting blessedness. "Not by works of righteousness which we have done, but according to his mercy he saved us, by the washing of regeneration and renewing of the Holy Ghost; which he shed on us—abundantly through Jesus Christ our Saviour; that, being justified by his grace, we should be made heirs, according to the hope of eternal life." Titus, ch. iii., v. 5, 6.

Zoological Sketches.

(Continued from page 282.)

ot far from the picturesque house built by mus Burton, in one of the cages fronting the e of the superintendent of the Gardens, is to be a beaver. The wonderful instinct of this little nal is certainly not inferior to that of the huge nant. As yet he has not been placed in circstances to enable the public to witness his buildcapacities: but it is the intention, we understd, of the council to give him a stream of run- water, and the requisite materials to construct of those extraordinary dams for which this anis so famous. In Canada, where he used to ish, the backwoodsmen often came upon hill- completely cleared of good-sized trees by ies of these little creatures, who employed the d timber to construct their dams—dams, not of feet in length, but sometimes of a hundred fifty feet, built according to the best engineering ula for resisting the pressure of water, namely, angle, with its apex pointed up the stream, and ually narrowing from base to summit. In short, Brunel himself could not outdo your beaver in engineering operations. Even in confinement, sagacious rodent loves to display his skill, as nay learn from Mr. Broderip's account of his Binney:

Its building instinct," says that accomplished ralist, "showed itself immediately it was let out cage, and materials were placed in its way, this before it had been a week in its new ters. Its strength, even before it was half n, was great. It would drag along a large ping brush, or a warming-pan, grasping the le with its teeth, so that the load came over its lder, and advancing in an oblique direction till rived at the part where it wished to place it. long and large materials were always taken ; and two of the longest were generally laid e-wise, with one of the ends of each touching the , and their other ends projecting out into the . The area caused by the cross brushes and vall he would fill up with hand-brushes, rushets, books, boots, sticks, cloths, dried turf, or hing portable. As the work grew high, he suped himself on his tail, which propped him up irably; and he would often, after laying on one s building materials, sit up over against it, aping to consider his work, or, as the country le say, 'judge it.' This pause was sometimes wed by changing the position of the materials, and sometimes they were left in their place. After he had piled up his materials in one part of the room (for he generally chose the same place,) he proceeded to wall up the space between the feet of a chest of drawers which stood at a little distance from it, high enough on its legs to make the bottom a roof for him, using for this purpose dried turf and sticks, which he laid very even, and filling up the interstices with bits of coal, hay, cloth, or anything he could pick up; the last place he seemed to appropriate for his dwelling, the former work seemed intended for a dam. When he had walled up the space between the feet of the chest of drawers, he proceeded to carry in sticks, cloths, hay, cotton, and to make a nest; and when he had done he would sit up under the drawers, and comb himself with the nails of his hind feet."

Well done, Binney! If the beaver in the Garden will only work out his natural instincts as perfectly, we may expect some amusement. Up to a late period the beaver had become rather a scarce animal, the exigencies of fashion having nearly exterminated him. When silk hats came in, however, the annual slaughter of hundreds of thousands of hirace, for the sake of the fur, gradually slackened, and now he is beginning to increase in his native retreats,—a singular instance this of the fashions of Paris and London affecting the very existence of a prolific race of animals in the New World! In the very next compartment is a hare, who for years played the tambourine in the streets of the metropolis, but his master, finding that his performances did not draw, exchanged him at these Gardens for a monkey; and now, whilst he eats his greens in peace, poor Jocko, in a red cloak and a feathered cap, has probably to earn his daily bread by mimicking humanity on the top of a barrel-organ. But the hippopotamus surges into his bath in the inclosure as we pause, and there is a rush of visitors to see the mighty brute performing his ablutions. He no longer gives audience to all the fair and fashionable folks of the town. Alas for the greatness of this world! the soldier-crab and the Esop prawn now draw better "houses." Whether or no this desertion has embittered his temper, we cannot say; but he has certainly lost his amiability, notwithstanding that he still retains the humorous curl-up of the corners of his mouth, which Doyle used to hit off so inimitably. At times, indeed, he is perfectly furious, and his vast strength has necessitated the reconstruction of his house on a much stronger plan. Those only who have seen him rush with extended jaws at the massive oaken door of his apartment, returning again and again to the charge, and making the solid beams quiver as though they were only of inch deal, can understand the dangerous fits which now and then are exhibited by a creature who was so gentle when he made his *debut* that he could not go to sleep without having his Arab keeper's feet to lay his neck upon. This affection for his nurse has undergone a great change, for, on Hamet's countryman and coadjutor, Mohammed, making his second appearance with the young female hippopotamus, Obaysch very nearly killed him in the violence of his rage. He has a peculiar dislike to the sight of working-men, especially if they are employed in doing any jobs about his apartment. The smith of the establishment happening to be passing the other day along the iron gallery which runs across one side of his bath, the infuriated animal leapt out of the water, at least eight feet high, and would speedily have pulled the whole construction down, had not the man run rapidly out of his sight. We trust his temper will improve when his young bride in the adjoining room is presented to him; but she is as yet but a baby behemoth, although growing fast. The enormously strong iron railings in front of his apartments are essential to guard against the rushes he sometimes makes at persons he does not like. Look at that huge mouth, opened playfully to receive tit-bits! What is a bun or a biscuit to him? Down that huge throat goes one hundred pounds weight of provender daily. Surely the dragon of Wantley had not such a gullet.

The giraffes in the adjoining apartment have been in the Gardens so long that they are no longer thought a rarity; but it should be remembered that the four procured in 1835 from Khordofan, by the agent of the Society, were, like the hippopotamus, the first ever exhibited in Europe since the days of ancient Rome. Of these, only one female now remains; but very many have been bred in the Gardens, and have continued in excellent health. At the present moment three of their progeny are housed in the apartment we are entering. The finest, a male, is a noble fellow, standing nearly seventeen feet high. When he strides out into the enclosure, high up as the trees are protected by boarding, he yet manages to browse as in his African forests, and it is then that the visitor sees the full beauty of the beast, which is lost in the house. The giraffe, in spite of his mild and melancholy look, which reminds us forcibly of the camel, yet fights ferociously with his kind at certain seasons of the year. Two males once battled here so furiously, that the horn of one of them was actually driven into the head of the other. Their method of fighting is very peculiar; stretching out their fore and hind legs like a rocking-horse, they use their heads as a blacksmith would a sledge-hammer, and swinging the vertebral column in a manner calculated, one would think, to break it, they bring the full force of the horns to bear upon their antagonist's skull. The blow is severe in the extreme, and every precaution is taken to prevent these conflicts.

As we pass along a narrow corridor in which the ostriches are confined, we reach at length the last inhabitant of the Garden, and the most curious creature, perhaps, which it contains. If the keeper is at hand, he will open the door of the box in which it lives, and drive out for us the bewildered looking apteryx—the highest representative, according to Professor Owen, of the warm-blooded class of animals that lived in New Zealand previous to the advent of man. Strange and chaotic-looking as are most of the living things brought from Australia and the adjacent islands, this creature is certainly the oddest of the bird class, and is, we believe, the only one ever seen out of New Zealand. As it vainly runs into the corners and tries to hide itself from the light of day, we perceive that it is wingless and tailless; it looks, in short, like a hedgehog mounted upon the dwarfed yet powerful legs of an os-

trich, whilst its long bill, which seems as though it had been borrowed from a stork, is employed when the bird leans forward, to support it, just as an old man uses a stick. This strange creature seems to hold among the feathered bipeds of Polynesia a parallel position to the New Holland mole (Ornithorhynchus paradoxicus)—which possesses the bill and webbed feet of a duck with the claws of a land animal—among the quadrupeds. Mr. Gould remarks, that nature affords an appropriate vegetation to each class of animal life. Our universal mother seems to have matched her Flora to her Fauna in this portion of the globe; at least the paradoxical creatures we have mentioned seem in happy accord with Australian vegetation, where the stones grow outside the cherries, and the pear-shaped fruits depend from the branch with their small ends downwards! The apteryx is entirely nocturnal in its habits, pursuing its prey in the ground by smell rather than by sight, to enable it to do which the olfactory openings are placed near the point of the beak. Thus, the bird scents the worm on which it feeds far below the surface of the ground. We must not regard the apteryx as an exceptional creature, but rather as the type of a large class of birds peculiar to the islands of New Zealand, which have been destroyed, like the dodo in the Mauritius, since the arrival of man. Professor Owen, long before the apteryx arrived in England, pronounced that a single bone found in some New Zealand watercourse had belonged to a wingless, tailless bird, that stood at least twelve feet high. This scientific conjecture has lately been transformed into a certainty by the discovery of a number of bones, which demonstrate that several species of Moas once roamed among the fern-clad islands which stud the bright Polynesian Ocean. These bones have been found mixed with those of the apteryx, which thus becomes linked to a race of mysterious creatures which, it is supposed, have long passed away, although a tale is told—an American one, it is true—of an Englishman having come across a dinornis, whilst out on its nocturnal rambles, and of his having fled from it with as much terror as though it had been a griffin of old.

Our walk through the Gardens has only enabled us to take a cursory glance at a few of the 1300 mammals, birds, and reptiles at present located there: but the duty of the zoologist is to dwell minutely on each. To such, these Gardens have, for the last twenty-six years, been a very fountain-head of information. During that time, a grand procession of animal life, savage and wild, has streamed through them, and for the major part have gone to that "bourne from which no traveller returns." Let us rank them, and pass them before us:

Quadrumana	1069
Carnivora	1409
Rodentia	1025
Pachydermata	204
Ruminantia	1098
Marsupialia	219
Reptilia	1861
Aves	7320

—making a total of 14,205. Out of this large number many curious animals have doubtless left no trace; but through the care of Mr. Mitchell, no rare specimen has died within these last five years at least, without previously sitting for his portrait. The first part of the valuable collection of colored drawings from the inimitable pencil of Mr. Wolf, accompanied by a description from the pen of Mr. Mitchell, the editor of the work, is just published, under the title of "Zoological Sketches, &c.," and the others will speedily follow. The work, when completed, will be unique in the annals of zoology, both for the extreme beauty of the drawings, which may be said to daguerreotype the subjects in their most characteristic attitudes, and for the nature of the letter press, which proves that the editor has written from the life.

(To be concluded.)

For "The Friend."

Admonitions of History.

One of the advantages of history is the warning it gives, by recording the mistakes and wrongs of persons, who have been led astray, sometimes by evil designs and sometimes under incorrect views of what they supposed would promote a good cause. In relation to our Society, Sewel presents us with many trials which true-hearted Friends endured, both from some of its members, and from a persecuting world. In 1683, while persecution still lingered around the Society, some divisions disturbed its generally peaceful bosom, which commenced several years before through a few discontented preachers, and others who were drawn away by them. Their dissatisfaction at first was professedly with the attempt to institute the church government which has existed from that time, and has been a singular blessing to Friends. As George Fox was a principal instrument in this christian work, he became the chief object of their enmity. Because they had no meetings for discipline in the beginning, and Friends, being comparatively few, lived in mutual peace and unity, they alleged that such meetings were needless, and that every one should be left to the guidance of the Holy Spirit in his own mind, and not be subjected to the rules of men; not recollecting that every one is not obedient to this Holy Spirit, and in departing from the Truth, such require the care of their faithful spiritual brethren, to labour to restore them to the right way of the Lord. Their opposition was at first mainly directed to the Women's Meetings, who met at different times to provide for the sick and other indigent members. They alleged that sometimes debates took place on matters unsuitable for them, especially by some young women meddling with affairs properly belonging to the Men's Meetings. But the forwardness of a few, in interfering with what did not pertain to their duties, was no valid objection to the institution of a sound government in the church, or to the services of experienced women in the care to be extended to their own sex.

Sewel remarks, that as in great communities, there are generally found men who love to govern without being fit for it, so some of this description soon adhered to these preachers in promoting their plans. At such times of excitement, it is no uncommon thing for persons who dislike restraint, and a faithful adherence to the order and testimonies of the Society, to join the party with whom they can have more liberty, and can aid in directing their concerns according to their desire for ease. To escape persecution, a class preferred meeting privately, rather than attend the public meetings of the faithful Friends, and others also were ready to attach themselves to the separatists, who would prefer paying tithes to the priests, instead of suffering spoil or imprisonment for refusing those demands. Hence arose a schism, and some of them began to keep meetings by themselves, and so left their former Friends, though they pretended to agree with them in matter of doctrine. To these afterwards resorted such as were not strict livers, and therefore were unwilling to submit to church discipline, among whom the saying was common, that every one having received a measure of the Spirit of God, ought to regard that leader, without minding any rules prescribed by others. After having broken the band of christian fellowship and church regulations, it could not be expected they would be restrained from further violations of the rules whenever cause, in their estimation, presented.

In the progress of this defection, William Ro and Thomas Crisp appeared in print against t former brethren, and upbraided them with s imprudent, or inconsiderate act which they co collect, besides which they did not hesitate to p lish many untruths and misrepresentations. course is not unfrequently resorted to, when a cession is contemplated, in order to injure as fa practicable, the reputation of those they design leave. Rogers scornfully reproached Friends, having provided some indigent ministers with t porary sustenance at the expense of the pu funds, who, in the performance of their religi services, were obliged to leave their business; tho this supply never exceeded necessary provision.

At length this rent appeared also in Lond where likewise malcontents were not wanting, w not being strictly conscientious, would rather without any restraint; and even some honest p sons were by fair words persuaded to separat For among them one Charles Harris preached, w was pretty fluent in speech, and not inelegant his expression, as I have seen and heard mys But however specious their pretence was, and wh ever endeavours they made to sustain themselv and advance their projects, they were not able continue and *subsist as a united body, but at len, they decayed and vanished as snow in the fie.* The best among them came in time to see they h been deceived, and the less honest grew worse, *among themselves they were not free from divisi* I have often wondered how [the three chief in gators of defection], all of whom I have know could apostatize to such a degree as they did; t yet this is not so exceeding strange as some m think it to be; for we find on record, that e in the primitive apostolic church, was an Alexan the coppersmith, and an Hymeneus and Philetus, w made shipwreck of faith, and caused a rent, in much that it is said, their words would eat as a canker.

An epistle from Friends met in London, 16 signed by G. Whitehead, W. Penn, S. Crisp, T. Brig C. Marshall, L. Howard, R. Barclay, and ma other substantial Friends, has this salutary te mony and counsel. "Our salutation is to all dear friends, brethren and sisters in this and ot nations; having the general state of the church and people of God opened unto us, with a tend care upon our hearts, and breathing of our soul that they all may grow, prosper and be preserv in unity, grace and good order; that divine and virtue may reign, and abundantly flow o and through all to your replenishment and unspeakable comfort—that you may keep out enemy in all his appearances, that would make visions and disturbances in the churches—for this time the enemy is busy, and secretly at wo for that end, to make rents; endeavouring there to bring the open opposers and adversaries of Tru over us. It is, that strife and divisions may stirred up among ourselves, that they desire a watch for; and therefore, where any are inst ments thereof, they serve not the Lord Jesus Chr but the enemy; they that make divisions, and ca offences contrary to the gospel, and that seek sow discord among brethren, are not only to marked, but the Lord will make them manife and his power will bring them under, and debo them, as it hath done, and will do that spirit, wh is guilty of jealousies, evil surmisings, whisperin and hard speeches against the brethren, and fai ful labourers in the Lord's work. It is the accu of the brethren that strikes at their testimony, a

:s to undermine, and to beget a disesteem and
ht of them in it, which adversary must be
ched against, and forever cast down and out.
l we are assured from the Lord, that all sow-
f discord, accusers of the faithful brethren,
hters and undervaluers of their testimony and
, self-seekers, whisperers, backbiters, and all
willed and self-exalted spirits, God will debase;
eternal power will work them under, and all
which offends shall be removed. God's pure
er is at work—refining, thoroughly purging his
r, and sanctifying his church and people; that
e may be no rent nor schism, but that the Lord
y be one, and his name one, among us; and
sed are you that keep to your first love, and
in your integrity to the end.
), dear Friends and Brethren, watch in the
t against all the enemy's wiles, and pray for
peace of Jerusalem, that she may be seen in
beauty and splendour, *as a city without*
aches; that peace may remain in her walls, and
perity within her palaces. O! let it be the
eral care of all our brethren, to whom the Lord
committed an oversight in the churches, to
o things quiet and in good order, by the power
wisdom of God, who is not the author of con-
on but of peace—and that the public affairs of
th be managed and carried on in the same
er and wisdom, which is pure and serviceable;
all in humility may submit to Christ's rule and
ernment, in the spirit of meekness and conde-
sion. Keep out all roughness and harshness,
towards another, and all self-rule and dominion,
is not of the life, but in the will of the flesh;
let all that be kept down forever—and that *no*
nge fire be kindled among you; nor in your
tings." "And in his authority and power, [the
er of God,] we stand witnesses against that
it forever, both in our open and secret enemies,
ch either smites at our heavenly Society, or
ld break our unity. To the Prince of peace,
is our Head and lawgiver—unto whom thrones,
minions, principalities, and powers are subject,
glory forevermore! unto whose power and gov-
ment we commit you all, and in true endeared
rest your dear brethren."

From The Leisure Hour.

A Microscopic Entertainment.

Man seems to tenant a position between two ma-
al worlds; the one of infinite and unfathomable
ness and immensity, stretching away beyond
limits of even thought itself into an eternity of
be; the other of inconceivable minuteness, so
ll that a whole dynasty is seen fulfilling the
ditions of its being in a single drop of water,
a million of its inhabitants filling a space in
ation no larger than that occupied by a single
in of sand. For the major part of the knowledge
have obtained of both these worlds—and as yet
have made as little progress in the one as the
er—we are indebted to two instruments, the
scope and the microscope. It is at the latter
y that, on the present occasion, we shall take a
sory glance. Under the general denomination
'microscope," are included a variety of instru-
nts, some of them of the cheapest and simplest
n, and others of the most costly and scientific.
s, a piece of card blackened with ink and punc-
ed with a single pin-hole, is a microscope, because
looking through it, it virtually magnifies an ob-
by enabling you to see it nearer than you could
with the naked eye, though it is barely available
anything larger than a fly's foot. If you make
puncture a trifle larger, and melt a piece of glass
st drawn out thin as a hair in the fire) in the
ne of a gas-lamp, adroitly pushing it farther into
the flame as it liquefies, until it becomes a little
round knob, and insert that knob into the hole in
the card, you will have a microscope of the next de-
gree of power. This is as far as you can go gratui-
tously. Then you can buy the Stanhope lens for a
crown, and with that you may make observations
really interesting; but if you wish to pursue micro-
scopic science with advantage, you must go to the
expense of an instrument purely achromatic, mag-
nifying some hundreds of times, and (what is of
more importance than mere magnifying power, for
which your man of science cares less than the sight-
seer,) defining clearly and truthfully; this last is
the triumph of the optician—an instrument that
tells the truth severely. Microscopes deserving
this high character are necessarily very expensive,
a single lens costing several guineas. The real
value of a good instrument, however, is beyond all
price, because it is a key to a new world of wonders,
teeming with novelties never to be exhausted. Be-
yond these, which are all of a conveniently portable
kind, and opening a much more extensive field of
observation, is the oxy-hydrogen microscope, which,
embodying the principles of the magic-lantern, can
be made to magnify millions of times; but it has
this great disadvantage, that it exhibits the mag-
nified shadows of the objects, and not the objects
themselves; and though, when these are transpar-
ent, some degree of colour is obtained, positive truth
of colour can scarcely be relied on.

These few remarks may serve perhaps as an in-
troduction to a microscopic entertainment to which,
having lately been a guest ourselves, we shall take
the liberty of introducing the reader.

On entering, we find a series of tables set out
with a number of microscopes of good defining
power, and furnished with subjects, some of them
novel in description, and all of an interesting kind.
Everybody—and everybody in this instance sig-
nifies a crowded attendance of ladies and gentle-
men—is anxious for a peep, and as only one can
peep at a time at one object, all have an opportu-
nity of exercising that patience which is so charac-
teristic of polite society. We pop down our head
at a venture at the first vacant eye-glass, and be-
hold! the lung of a toad, which shows like a crim-
son mass of virgin cinnabar, with a gnarled and
rather nuggetty surface, permeated everywhere
with a myriad of small air-cells: the intensity of
the red-hot colour, broken with its own shadowy
reflections, constitutes this an object of remarkable
beauty, independent of the marvels of its structure,
which, as a fair lady is nudging our elbow, we have
not time to dwell upon.

But here is another tube unoccupied, and we try
again. What is this we see? Upon a circular
expanse of rose-coloured soil, speckled all over with
points and spots of deeper hue, a thousand little
brooks, rivulets, and canals are pouring their flash-
ing waters with furious haste into larger channels,
in which again they rush along with a velocity that
threatens to wash away the banks. On goes the
torrent, glistening and sparkling in the intense light,
never pausing in its furious haste, but from unnum-
bered tiny trenches pouring into the main ducts, and
travelling, ever faster the larger the channel, to-
wards some outlet beyond the field of vision. What
can this be? On looking to ascertain, we find it
is a view of the circulation of the blood in the toe
of a frog—froggy having consented, for reasons
sufficiently powerful, to lie in a moist bag, and to
suffer as much of that useful member of his as could
be seen through an orifice of some sixteenth of an
inch in diameter to be subjected to investigation for
the benefit of science. The devoted professor of
gymnastics lies perfectly quiet, but, looking to the
galloping current in his veins, we suspect that he is
paying for his complaisance by symptoms decidedly
feverish.

Now for a third peep. Not willing to be taken
by surprise this time, we look at the object first, but
can see nothing more than a dim grey speck of
something about the size of a small pin's head.
But on placing one eye at the tube, lo and behold!
what seems a sepia drawing admirably finished in
all its details, of a view on the Seine at Paris—a
view of a bridge over which we have walked a hun-
dred times in days gone by—of boats and build-
ings, and surrounding objects, true to the very life,
and defying us not to recognise the spot with all its
details. Of course we know at once that no artist
could have drawn this picture, and that it is a pho-
tograph painted by the agency of light. But the
marvel is great, notwithstanding, and we look again
and again, now at the all but invisible picture it-
self, now at its magnified proportions as seen through
the microscope, and should look much longer but
for considerations of good manners. This, it strikes
us, is the severest test to which photography could
be applied; and it seems almost incomprehensible
that upon a surface not larger than one of the let-
ters of this page, can be represented the perspective
of a broad river, its bridges and the buildings which
rise upon its banks.

A fourth peep gives us the surface of a piece of
granite, which shows like a spotty and transparent
assemblage of rich and varied colours; a fifth and
a sixth, and so on, reveal various objects more or
less favourites for the exquisite colours or curious
textures, or marvellous systems of growth and in-
crease, which they display. Then we come to a
microscopic apparatus on the magic-lantern princi-
ple, but on a portable scale, by which the shadows
of objects are thrown upon a white disk. A series
of them are shown in succession, the most amusing
being the exhibition of the monsters generated in
foul water, the whimsical motions of which excite
not a little laughter. The sight of these gentry
whizzing about in such a fantastic manner recalls to
our recollection certain displays of the same kind,
but on a grander scale, which we once witnessed
at a private exhibition of the oxy-hydrogen micro-
scope. At the end of a large room containing about
two hundred persons, a white canvass sheet was
tightly strained; the microscope, standing in a gal-
lery at the other end, projected the objects to be
seen, over the heads of the spectators, on the white
sheet—the room being in darkness, with the ex-
ception of such reflected light as proceeded from
the illuminated disk. Upon this disk first appear-
ed, swimming leisurely in the clear water, a huge
monster about the size of an average bull, opening
with deliberation a cavernous mouth every now and
then to admit some smaller fry which were disport-
ing around him, and which he swallowed up as the
merest matter of course, hardly deigning to look at
them. The creature seemed nearly all head and
tail, and bore an aspect indescribably ugly and ter-
rific; and yet, monster as he was compared to his
diminutive victims, he would himself be invisible
even under the power of a microscope magnifying
a hundred times. A second drop of water revealed,
to all appearance, the depths of an abyss in which
masses of vegetation hung in suspension; tangled
water-weeds floated towards the surface, and be-
neath their gloomy shadows lurked fierce shark-like
destroyers, measuring six feet or more in length,
watching their opportunity to dart out upon an un-
wary innocent and gobble him up. This they did
repeatedly, and one could not but admire the rapidi-
ty of their digestion, which disposed of a living meal
in a minute or two of *our* time. The whole abyss was
swarming with life; but we may fairly conclude that
over-population was prevented by the presence of the

devouring gentry alluded to, of whom we noticed six or seven taking exceeding good care of themselves —a startling illustration of the universal law.

Another change, and an anomalous creature, to be paralleled in no department of *visible* nature, appears upon the scene: it is nothing less in form and mechanism than a living telescope—a creature whose body consists positively of a succession of tubes shutting up one within the other, and who possesses the power of drawing out any or all of them, and thus increasing or diminishing his stature to suit his own personal convenience. His head terminates the smallest tube. He is a greedy fellow, constantly on the look-out for prog; now, for the sake of reaching a victim, elongating his body to the extent of sixteen feet; now, perhaps for convenience of swallow, contracting it to that of about eighteen inches; and when stretched out is so transparent, that you may see the fluids circulating in his frame.

We might multiply these marvels, which the microscope opens to our contemplation, almost *ad infinitum*, but that is not our object, nor would it be quite fair to those of our readers, of whom we are aware there are not a few who know this subject well. Our design is rather to present to those who have the desire to study the works of nature in her minutest operations, some samples of the harvest they may expect to reap in the intelligent prosecution of such a pursuit.

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 285.)

SAMUEL SPICER.

Samuel Spicer, it appears from the ancient records of Long Island, was the son of Thomas Spicer and Michael his wife, and was born in New England some time prior to 1640. When "Lady Deborah Moody" was excommunicated in 1643 by the Puritans at Salem, Massachusetts, because she disbelieved in the efficacy of infant baptism, she sought a place of refuge where unmolested by man she might worship God, according to the dictates of her own conscience. She thought she had found such a spot on the west end of Long Island, amongst the Dutch. Thither she accordingly removed with her son Henry, the baronet, and several other persons, who were driven from the Bay Colony by the intolerance of the rulers. Thomas Spicer and family were amongst them.

In the year 1645, Governor William Keift granted by patent to the new settlers the land, now the township of Gravesend. Here, in the supposed possession of freedom of conscience and liberty of speech, they proceeded to improve the lands which they purchased. But even the Hollanders had not yet learned that people were to be allowed to think freely, if freedom of thought led to conclusions differing from those which they regarded as truth. Deborah Moody whom they termed a Lady, and whose name they insert the first in the patent granted for the land at Gravesend, having stated it as her judgment, that "infant baptism was no ordinance of God," was arraigned before the authorities at New Amsterdam as a public offender. It is likely that her polemical abilities were more than equal to that of Governor Keift and all his counsel, and she appears to have come out of this encounter with them with a decided advantage, so that her influence even with them was rather increased than lessened. Thompson, in his History of Long Island, says, "This gifted heroine, however, sustained herself in the conflict, and rendered very essential service to her afflicted companions.* Her wealth and extraordinary abilities commanded universal respect, and to these her virtue and courage were fully equal."

In 1654, Governor Stuyvesant and counsel having refused to appoint as magistrates two of the patentees, who had been nominated by the inhabitants of the town for that station, a considerable excitement arose in Gravesend, insomuch that the Governor sought to obtain the influence of Deborah to allay it. Finally, he and counsel left the nomination of magistrates to Lady Moody "as eldest and first patentee," and to the sheriff.

When the first Friends in 1657 came to Gravesend, Deborah Moody gave them her protection, and appears to have been thoroughly convinced of their principles. Her life, however, was not long continued, or it is probable she would have been brought into suffering for her testimony to the truth. After her death, her son the baronet removed, it appears, to Virginia, from whence in 1660 he returned to the New Netherlands, as an ambassador from the Governor and counsel of the former province. It does not appear how far he sympathized with his mother in her doctrinal views. His death took place, it is said, in 1662.

The persecution which arose in 1657 against the Quakers, and those who harboured them, fell severely on some. We have already, in "The Friend," had occasion to give many particulars relative thereto, and shall now only touch on such as relate to Samuel Spicer. His father deceased probably about 1657 or 1658, and Samuel and his mother were both convinced of the Truth as held by Friends. He appears to have had a brother Jacob, but whether he united himself to the poor persecuted people called Quakers or not, we have no information.

In the year 1660, Samuel Spicer with others, were imprisoned at New Amsterdam, for encouraging the Quakers; that is, for giving food and lodging to those who, as ministers of the gospel of Christ, were travelling abroad, subject to persecution for His name's sake. One of those persecuted and oppressed ministers, George Rofe, hearing that Samuel Spicer and another of his young friends were in prison for their testimony to the truth, felt constrained to address some letters of consolation and advice to them. One of these, although somewhat defaced with age, is still preserved. So much of it, as can now be read, runs thus,—

"Dearly beloved,—Whom my father hath truly loved, and whom I long after with the love wherewith my heavenly Father hath loved me. To manifest his love the more to you, he hath counted you worthy to suffer for his name's sake. This is the confirmation of his love. He hath even chosen you from among so many, that you may be to the praise of his grace, and for the glory of his faith, for which you now suffer, and are in outward bonds. This is the service which the Lord, the righteous God, at this time requires of you. Keep low in the light, to feel the life,—that in it you may be upholded, and borne up in your service, which is your suffering; that you may truly perfect it to his praise and glory, who hath so loved you.

"Oh, my dear ones, continue in his love, and wait in his light, in the true feeling of life; so will you be upholden. Keep inwardly, be low, I exhort you, [seek for a meek and quiet spirit, which] is with the Lord of great price. * * * He will rule the heat, and quench the violence of the wrath which hath been kindled against you. So [will ye] be brought through the fire, without any smell upon your garments, and the Lord will be honoured in your faithfulness, when you have truly finished in his fear what he hath committed to your trust. Oh, my dear babes, I exhort you to be truly meek and tender, that you may reach the seed in all who come to visit you. That your life may reach unto the life in them. Let your words be few [and savoury], seeking in the pure love of Him who hath so loved us, [that others may be brought to the same light and the same life. I do truly remember you, and salute you, and in fellowship with you do truly suffer. * * * * *

"From Oyster Bay, the 7th of the Eleventh mo. 1660.

"To the hands of Henry Wilson or Samuel Spicer, wherever it may come to them."

Henry Townsend suffered much at the hands of Stuyvesant and of his spies. He and Samuel Spicer in 1661 were again in the loathsome prison in Fort Amsterdam. Two magistrates of Jamaica, Long Island, informed the Governor that twelve persons, some of whom were women, "had countenanced the Quakers." Samuel Spicer was charged with having "also given entertainment to a Quaker in his mother's house, in Gravesend." "It was proved by witnesses, that Townsend had given lodging to a Quaker, and besides notifying his neighbours, had even allowed them to preach in his house, and in his presence; also, that Spicer was present, both at the meeting at Jamaica and Gravesend, and procured lodging for the Quaker at his mother's house. They were accordingly condemned in an *amende* of 600 guilders each, conformity to the placard respecting conventicles, and to be imprisoned until the said *amende* be paid; and further, that the said Henry Townsend be banished out of the province, *for an example to others*. The widow Spicer, mother of Samuel, was also arrested, accused, and condemned in an *amende* of £15 Flanders. The said Henry Townsend having ingenuously acknowledged that he lodged in his house some other Friends, who are called Quakers, and had a meeting of Friends at his house, which one of them spoke, concluding by saying that they might squander and devour his estate, emanacle his person, but that his soul was his God and his opinions his own; whereupon he was again condemned, and sentenced with much formality."

It is recorded that during H. Townsend's imprisonment because he could not conscientiously pay a fine, his daughter Rose, a little girl of only nine abo years of age, supplied him daily with food throu the grating. Her tender age and persuasive a peals affected the heart of the keeper so far, th he hindered not this touching work of filial lo How long Samuel Spicer was imprisoned for fine, we know not; but if not before, the captu of New Amsterdam by the English in 1664, wou insure his release.

On the 5th of Eighth month, 1662, John Tilt and Mary his wife, two faithful servants of t Lord Jesus Christ, were accused to the Govern of having entertained Quakers, and frequented th *conventicles*. They were condemned to depart t province before the 20th of the Ninth month, pain of corporeal punishment. They did not ob the decree or order, and probably some fine w levied, in lieu of the public whipping. During t trial, Mary, or as she is called on the record "Goo Tilton," was condemned "for having, like a *sorcere* gone from door to door, to lure and seduce t *people*, yea, *even young girls*, to join the Qu kers."

One of the charges on record against John T ton for which he was fined, runs thus, for "perm ting Quakers to quake at his house in Gravesend This noble couple outlived all persecution, and

* Several other settlers being persecuted at the same time.

For "The Friend."

Church Rates in England.

The antichristian impositions practised upon dis-
ters, by the Protestant Episcopal Church in Great
itain, seems like the resuscitation of the old per-
uting spirit which laboured, especially through
clergy, to destroy Friends for about forty
rs after their rise. All the dissenters, we sup-
se, keep their own meeting-houses in repair, at
ir own expense. They would not think of coercing
ir church neighbours to pay any part of the cost,
d to us, in this land, it seems an act of sheer injus-
e to compel others to do so. The violent seizure of
property of conscientious persons, and sacrificing
to pay other people's debts, is exemplified in the
bjoined account taken from the British Friend of
st month:

"We copy the following from the *Cambrian*.—
is has been a great day for the church as by
w established, at the enlightened town of Neath,
ght miles from the metropolis of South Wales.
have read of seizures for church rates, but never
ttnessed the disgusting proceedings till to-day.
wo policemen, accompanied by two men of the
ost filthy appearance, entered the shop of Mr.
ibbert, passing through to the parlour, seized (or
gally robbed Mr. Hibbert of) a handsome sofa,
lued about £7, for the paltry sum of a few shil-
gs. They then proceeded to Mr. Kenway's, and
ok away two sacks of flour, and from thence to
her respectable houses; and in every case took
nsiderably more than the value of the legal rob-
ery. A large number of warrants are still to be
xecuted, and great will be the praise of parson
riffiths and his generous church wardens. O
hame! that the religion of our Lord should be
rofessed by men, capable of such actions; and
etter will it be for them and the religion they pro-
fess, if they at once lay aside any pretension there-
to. What a stumbling block to doubters, and cause
of scoffing to unbelievers! And further while this
is being enacted, bills are stuck up, announcing
Lent Sermons !!! Let me refer these pious men
to our Saviour's words, (Matt. xxiii.) The church
rate contest at Neath has called forth a spirit of
malignity and feelings of hatred among the inhabi-
tants, that will not be extinguished for years. It
may be "fun" to some, but to a man of feeling it is
no small matter to see our neighbour's dwellings
entered, and their goods levied upon and removed
for payment of an oppressive and unjust tax.

"On Monday week, the house of Mr. Jonathan
Rees was entered, and his goods seized and re-
moved, amidst demonstrations of hostile feeling on
the part of a large number of the inhabitants, that
cannot and will not soon be forgotten. Orders for
payment of rates are being served right and left,
further levies will be made; and, supposing a
respectable auctioneer can be found, and purchasers
to buy, the money will be realized. But what
then? Say that payment of the rate will be ob-
tained, the steeple repaired, the church and church-
rails painted, the parson's surplice washed, &c., I
would ask, Is there anything the church can do to
atone for all this? I fear not. The object has
been gained, but, as it appears to me, at a fearful
cost, and the responsibility must, and will ultimately
fall on the right parties.

The *Swansea and Glamorgan Herald*, speak-
ing of the church rate seizures, says:—"About 12
o'clock, on Monday last, crowds assembled, on the
qui vive of expectation that the goods of Mr. Jo-
nathan Rees, a member of the Society of Friends,
and one of the oldest and most respected inhabit-
ants of Neath, were to be seized. The popular
anticipation proved but too true. At 12 o'clock,
Superintendent Worman and his officers entered
the dwelling of the staunch 'Old Quaker' accom-
panied by two porters. The scene was indescri-
bable—hundreds of persons were assembled in
Queen street, near Rees' residence, and on the ap-
pearance of the executors of the law, after the dis-
charge of the ungracious task, the scene was beyond
description. On this as on previous occasions, por-
ters were hired, but they evidently did their work
most reluctantly. The trophies borne off from Mr.
Rees' dwelling, were four arm-chairs. These the
porters carried for some distance, amid the gibes
and hootings of the crowd, accompanied by the
firing of pistols and small guns. On reaching the
market gates, the porters fairly abandoned their
load, in pure disgust. At length, half an hour
more elapsed, before the police could find any party
to convey the seized goods to their destination. The
furniture taken from Mr. Rees' premises, were six
chairs, some handsome dish covers, and a copper
tea kettle. They must be sold by auction, but the
difficulty will be to find an auctioneer, as we have
been informed that more than 'one man of busi-
ness' in that line has positively refused to have any-
thing to do in the matter. Let the auction come
when it may we expect a rich scene." [At our
latest advice no auctioneer could be had.—*Eds.
B. F.*]

These doings are opposed to the spirit and prin-
ciples of the gospel.

"Sometimes we may compare the troubles which
we have to undergo in the course of a year to a great
bundle of fagots, too large for us to lift. But God
does not require us to carry the whole burden at
once; he mercifully unties the bundle, and gives us
first one stick, which we are to carry to-day, and
then another, which we are to carry to-morrow,
and so on. This we might easily manage, if we
would only take the burden appointed for us to
carry each day; but we choose to increase our
troubles by carrying yesterday's stick over again
to-day, and adding to-morrow's burden to our load,
before we are required to bear it."

Epistle of George Fox.

About this time, I was moved to give forth the
following to go amongst the convinced and tender
people, to manifest the deceits of the world, and
how the priests have deceived the people:—

To all you that love the Lord Jesus Christ with
a pure and naked heart, and the generation of the
righteous.

Christ was ever hated; and the righteous for
his sake. Mind who they were that did ever hate
them: he that was born after the flesh, did perse-
cute him that was born after the Spirit; and so it
is now. Mind who were the chiefest against Christ;
even the great, learned men, the heads of the peo-
ple, rulers and teachers, that professed the law and
the prophets, and looked for Christ. They looked
for an outwardly glorious Christ, to hold up their
outward glory; but Christ spoke against the works
of the world, and against the priests, and scribes, and
Pharisees, and their hypocritical profession. He
that is a stranger to Christ, is a hireling; but the ser-
vants of Jesus Christ, are freemen. The false
teachers always laid burthens upon the people;
and the true servants of the Lord spoke against
them. Jeremiah spoke against hirelings, and said,
It was a horrible thing; what will ye do in the
end? for the people and priests were given to covet-
ousness. Paul spoke against such as made gain
upon the people, and exhorted the saints to turn
away from such as were covetous men and proud,
such as loved pleasures more than God, such as
had a form of godliness, but denied the power
thereof; "for of this sort," said he, "are they that
creep into houses, and lead captive silly women,
who are ever learning, but never able to come to
the knowledge of the truth; men of corrupt minds,
reprobate concerning the faith; and as James and
Jambres withstood Moses, so," said he, "do these
resist the truth; but they shall proceed no further,
for their folly shall be made manifest unto all men."
Moses forsook honours and pleasures which he
might have enjoyed. The apostle in his time saw,
this corruption entering, which now is spread over
the world, of having a form of godliness, but deny-
ing the power. Ask any of your teachers, whether
you may ever overcome your corruptions or sins?
None of them believe that; but "as long as man
is here, he must," they say, "carry about with him
the body of sin." Thus pride is kept up, and that
honour and mastership which Christ denied, and
all unrighteousness. Yet multitudes of teachers!
heaps of teachers! the golden cup full of abomina-
tions! Paul did not preach for wages, but labour-
ed with his hands, that he might be an example to
all them that follow him. O people, see who follow
Paul! The prophet Jeremiah said, "The prophets
prophesy falsely, and the priests bear rule by their
means;" but now the priests bear rule by the
means they get from the people: take away their
means, and they will bear rule over you no longer.
They are such as, the apostle said, "intruded into
those things which they never saw, being vainly
puffed up, with a fleshly mind;" and as the Scrip-
tures declare of some of old, "They go in the way
of Cain, who was a murderer, and in the way of
Balaam, who coveted the wages of unrighteous-
ness." The prophet Micah also cried against the
judges that judged for reward, and the priests that
taught for hire, and the prophets that prophesied
for money; and yet leaned on the Lord, saying,
"Is not the Lord amongst us?" Gifts blind the

eyes of the wise. The gift of God was never purchased with money. All the holy servants of God did ever cry against deceit; and where the Lord hath manifested his love, they do loathe it, and that nature which holdeth it up. 1651. G. F.

From the British Friend.

Macaulay and George Fox.

We direct attention to a very able letter from Mr. William Howitt, in vindication of the character of George Fox, the founder of the Society of Friends, from the aspersions cast upon it by Mr. Macaulay, in his *History of England*. We have always regarded George Fox, notwithstanding certain peculiarities of religious belief, as one of the best, and what is more, one of the greatest men for acuteness of mind, and a clear and conclusive manner of stating and defending his views—whether with regard to religious, moral, social, or political points—which England has produced. We have always regarded him as standing at the head of that noble army of living martyrs to their principles, of whom we have happily so great a number in the annals of our country. We are glad to find that Mr. Howitt has taken up the cause of this great and good man, against the calumnies of Mr. Macaulay, who appears to be influenced by feelings of deadly hostility—for which there must be a cause—to the leading men of the Quaker persuasion, some of whom have shed a lustre on human nature. We could not wish the memory and character of George Fox to be in better hands than those of William Howitt. He will do for the founder of the Society of Friends what Mr. Hepworth Dixon has so triumphantly done for William Penn. After reading the exposures which have already been made of the inaccuracies, and, we fear, we must add, as regards George Fox and William Penn, the misrepresentations of Mr. Macaulay, the witty saying attributed to Thomas Carlyle respecting Macaulay's work, acquires a force and point which we were not in the first instance disposed to ascribe to it. A friend of Mr. Carlyle, who was suffering from depression of spirits, asked the latter what he ought to do to dispel the gloom which hung over his mind. "Read," replied Mr. Carlyle, "the works of Bulwer or Thackeray, or Macaulay's *History of England*, or any *other* romance."

Morning Advertiser.

TO THE EDITOR OF THE "MORNING ADVERTISER."

"Sir,—The attacks of Mr. Macaulay, in his recent volumes of his *History of England*, on the Covenanters, the Puritans, and William Penn, have naturally called forth indignant remonstrances from those who think highly of those parties; but the character of George Fox, the founder of the Society of Friends, has been still more grossly and unjustly maligned by Mr. Macaulay; and who has stepped forward to defend *him?* Perhaps it is the very extravagance of the charge which has disarmed it of its force, and which has not induced even the Society which maintains his principles to come forward on his behalf. And yet so injurious an assault on a truly noble character ought not to pass unnoticed, as if it were in any degree admitted to be warranted.

"In about half-a-dozen pages, Fox is sketched off as a fool, a simpleton, a man of disordered intellect, absurd in his theories, crazy in his doctrines, and talking and writing 'nonsense' and 'gibberish.' 'If we form our judgment of George Fox,' says Macaulay, 'simply by looking at his own writings, we shall see no reason for placing him morally or intellectually, above Lodowick Muggleton, or Joanna Southcote.'—Vol. iv. p. 28.

"That, Sir, is the deliberately recorded judgment of Mr. Macaulay on George Fox. Can such a judgment be held for a moment to be a sound, impartial, and philosophical judgment? Can it be possible that the active and successful endeavours of the Friends in Edinburgh, some years ago, to unseat Mr. Macaulay, when they deemed him inattentive to his Parliamentary duties, be the cause that in his history he falls thus lustily on every Quaker who comes across his path? If so, it is a circumstance most pitiably derogatory to the dignity, and detrimental to the character of the historian for reliability. Such a judgment is a gross insult to every member of that highly estimable Society, which, to this day, hold the fame and the doctrines of George Fox in reverence. Is it at all likely that the people of Fox's own times—not merely ordinary and uneducated people, but judges, clergymen, scholars, and gentlemen, of all parties and ranks, in thousands, would have flocked after him, if he only 'talked and wrote nonsense and gibberish?' Is it likely that at this time of day, when every man thinks and inquires for himself, amid a blaze of intellectual light, that a large, wealthy, well-educated, and acute body of our countrymen, who have long distinguished themselves by their general sagacity, and by their active pursuit of moral and national reforms, should still cling steadfastly to the steps and the teachings of a man who only 'talked and wrote nonsense and gibberish?'

"The assertion is too preposterous. It is, indeed, so preposterous, that I shall not stop to inquire, in the slightest degree, what were 'the talk and the writings' of this man. Luckily they are still before the public in good legible type, and any one may easily learn what they are in Fox's own *Journal*, in Sewell's *History of the Quakers*, in Barclay's celebrated *Apology*, and in Thomas Clarkson's *Portraiture of Quakerism*. In those works, the last by a clergyman, of the Church of England, the reader would find to his astonishment, if he had previously been so ill-informed as to be capable of believing for an instant the calumny of Mr. Macaulay, that George Fox was one of the most noble, disinterested, intellectually able, and religiously profound and independent men that ever lived. He would very soon perceive that the doctrines which he preached, and for which he suffered in his own day, are become the doctrines of almost every Christian church existing—that he was an especial hater of shams and sycophancy, upright, brave, independent and clear-seeing—that he seized on Christianity literally and substantially—that he saw it as expounded in the New Testament, not only as a principle which purified and renewed the religious life of the soul, but which carried inevitably its reforming power into every human law and institution. Taking the ground that Christianity taught civil and religious liberty, and that its first injunction was to love God, and its second to love our neighbour as ourselves, he declared war against every species of oppression and despotism. He arrived at the full conviction that war, slavery, and the domination of particular churches and creeds, were as opposed to the spirit of true religion as to the true interests of man. Fox himself, when in Barbadoes, began that crusade against negro slavery which has in our time extinguished the slave trade and slavery in our own country. This doctrine, perpetuated amongst his disciples, made them the instant and most zealous allies of Clarkson and Wilberforce, when they opened their successful campaign against this monster evil.

"Are these, Sir, the doctrines and influences of a man who only 'talked and wrote nonsense and gibberish?' That Fox was an illiterate man, he was himself the first to declare and record; and it is surprising that Mr. Macaulay should not have s that this was a part of his real glory—that be illiterate really enhanced his greatness, showing t it was by an inherent force of native intellect, by the advantages of learning, that he made way to eminence. That which has always b held to be one of the marvels of the character Shakspeare, and, indeed, of the apostles, cannot a legitimate cause of ridicule in George Fox.

"But instead of taking the superfluous trouble of quiring, at this time of day, into the life and opinio of Fox, let us ask what has been the estimate of t by men of equal or superior mental calibre with Macaulay. Let us place testimony against te mony, and see what is the result.

"Coleridge, in his *Biographia Literaria*, say —'One assertion I will venture to make, as s gested by my own experience, that there exist fol on the human understanding, and the nature man, which would have a far juster claim to th high rank and celebrity, if in the whole huge volun there could be found as much fulness of heart a intellect, as burst forth in many a simple page George Fox."

"That is the declaration of a man distinguished the depth of his metaphysical researches; and, his ideas of religious and political government, no means likely to overestimate Fox.

"Charles Lamb, in his *Essays of Elia*, declar that Sewell's *History of the Quakers* is worth mo than all ecclesiastical history put together, becau we have in it so noble a record of the noble prin ples of civil and religious life which Fox establishe

"Governor Livingstone, a distinguished Americ statesman, says:—'George Fox alone has, witho human learning, done more towards the restorati of real, primitive, unadulterated Christianity, a the extirpation of priestcraft, superstition, and ric culous unavailing rites and ceremonies, than a other reformer in Christendom has with it.'

"Sir James Mackintosh says of George Fox *Journal*, that 'it is one of the most extraordina and instructive narratives in the world, which *reader of competent judgment* can peruse witho reverencing the virtue of the writer.'

"And lastly, what says Thomas Carlyle, in h *Sartor Resartus?*—'This man, the first of t Quakers, and by trade a shoemaker, was one those to whom, under ruder form, the Divine ide of the universe is pleased to manifest itself; and across all the halls of ignorance and earthly degra dation, shine through, in unspeakable awfulness unspeakable beauty, on their souls. Who, there fore, are rightly accounted prophets, God-possessed Mountains of encumbrance, higher than Etna, ha been heaped over that spirit; but it was a spark and would not be buried there. That Leicester shoe shop, had men known it, was a holier place than Vatican or Loretto shrine. Stitch away, then noble Fox! Every prick of that little instrumen is pricking into the heart of slavery, and world worship, and the mammon-god. Thy elbows jer in strong swimmer strokes, bearing thee into land of true liberty. Were the work done, there would be in broad Europe one free man, and thou art he

"Now, these testimonies of eminent men of ou time accord perfectly with those which eminent me of George Fox's time have left of him. We migh take whole columns, from Cromwell to Elwood, th friend of Milton, but let us satisfy ourselves with single passage from William Penn:—'For in al things he acquitted himself as a man; yea, a strong man, a new and heavenly-minded man—a divine a naturalist, and all of God Almighty's making He held in him the foundation of useful and com mendable knowledge, and cherished it everywhere Civil he was, beyond all forms of breeding. Sc

ɛ, contented, modest, easy, steady, tender—it
a pleasure to be in his company. Thus he
l and sojourned amongst us; and as he lived,
e died, feeling the same eternal Power that had
d and preserved him in his last moments.'

Now, Sir, is it not at once amazing and most
ncholy that Mr. Macaulay can allow himself to
rde the great subject of a national history, by
natizing such a man as on a par with Joanna
theote? Does he suppose that he is writing of a
before unheard of and unknown? Does he
ose that he can, at will, reverse the calm judg-
t and affectionate reverence of the British public,
century and a half's duration? I cannot express
regret with which I find so unfortunate a cari-
re in his pages—regret not for George Fox,
for Mr. Macaulay. The blemish is not left on
, but on the work itself; and every lover of
fame, of both the living writer, and the departed
tle of independent truth, will anxiously desire
e these few unworthy pages replaced, in a future
ion, by an estimate more just to the dead, and
ourable to the historian.—I am, Sir, yours, &c.,
WILLIAM HOWITT."

For Renewing the Teeth of Files.—In our Crys-
Palace are shown several patented modes of
ewing old files. Here is a method patented by
Gilbert, of London. The Teeth are renewed
a corrosive agent applied to the surface of the
The files are first cleaned from any super-
ndance of greasy matter, and then placed in a
k inside a bath composed as follows:—With
pound of unslacked lime mix two pounds of
ash in one gallon of water, stir the whole in-
ately together, allow it to remain till three-
ths the liquid has passed off by evaporation,
w off the remaining quarter of a gallon of liquor,
allow it to cool. In this liquor the files are to
ain four hours, and are then to be removed and
shed, cleansed in clean water, and made quite
from grease, and then immersed in a vertical
ition in a mixture of one part of sulphuric acid,
ated with two parts of water. The biting action
the acid attacks the whole surface of the files
mersed; the continued effect of which is to deepen
several cavities between the cutting points of
teeth, which become as sharp as they were ori-
ally. The files must be immersed for from
ee to six hours or upward, according to the fine-
s of the files and the strength of the liquid. The
s must be withdrawn and brushed from the oxide
med, five or six times during the process. The
entee states that the process is at once comparа-
ely inexpensive and removes so little metal, that
nay be repeated three or four times on the same
, and thus it will render it advantageous to wear
s much less than usual before renewing.

Selected.

Society is pleasant—yet it becomes a snare, if it
d us from our secret chamber by its incessant
raction, and thus makes us strangers to our God
d our own hearts.

It is often better to pray for those who are mis-
ken, than to dispute with them.

I see in this world two heaps, of human happi-
ss and misery. Now, if I can take the smallest
from one heap, and add to the other, I carry a
int. If, as I go home, a child has dropped a
lf-penny, and if, by giving it another, I can wipe
ay its tears, I feel I have done something; I
ould be glad, indeed, to do greater things, but I
ll not neglect this.

Be not deceived with the first appearances of
ngs, but give thyself time to be in the right.

Unequal Justice.—It is a saddening consideration that the law, which is designed to be a "terror to evil doers," fails in too many instances to sustain its dignity by the inequality with which it distributes its penalties. While it makes a parade of its strictness in punishing the petty culprit who, ignorant and friendless, has been tempted to steal to supply his daily wants, it too often suffers the enormous offender to escape unscathed. The greatest robbers in our country have, by some means, eluded justice. Their family connexions, or their former respectability, or peradventure, some accommodating interpretation of their offence into a mere breach of trust, has exerted a potent influence in shielding them, and they even claim a certain degree of respect, because, superior to trifles, their frauds have mounted up to hundreds of thouands. Law, to be good and righteous, should certainly proportion its punishments to the measure of the offence. If any offender is entitled to leniency, it should be the miserable victim of ignorance and poverty; and yet almost uniformly he who, from position and education, is without excuse, is the favoured one. We have been led to these remarks by a paragraph which has just fallen under our eye, from which we learn that the treasurer of a certain county in Ohio, who defrauded the public of twenty-two thousand dollars, was sentenced to *one* year's imprisonment, while another individual, who sold a borrowed horse, (a breach of trust!) and kept the avails, to the amount of seventy-five dollars, was sentenced to *three* years imprisonment. The laws in these cases certainly walked on unequal legs. A few notable examples of just severity against defaulters would have a more decided influence in rendering our public institutions safe than any other measure which could be adopted. The promise of impunity is the great temptation to crime. The certainty of ten or twenty years in the penitentiary would prove a powerful dissuasive.—*Presbyterian.*

Home Piety.—Enjoyment of religion depends on observing little home dutics—or fireside piety. An occasional effort to do some great thing may ease the conscience for a while; but it is only the spirit of Christ carried into the family, and into every-day life, softening the temper, and rendering the heart affectionate, which can impart an habitual elevation and serenity of mind.

It is an odd sight, but very evident, that families and nations of cross religions and humours, unite against those of their own, where they find an interest to do it.

THE FRIEND.

FIFTH MONTH 24, 1856.

We have received from the Editor, T. H. Stockton, of Baltimore, a printed sheet, entitled "The Bible Times," intended to come out monthly, and designed to promote the circulation and reading of the Holy Scriptures. It also announces the intention of publishing the whole of the Old and New Testament in separate numbers of small size, printed on good paper and with a clear medium sized type. The copy of Matthew which we have seen, is well got up, and very convenient for reading. Small tracts composed of detached portions of Scripture, bearing on different points, are also part of the plan for rendering the contents of the Bible more familiar with the multitude.

We are glad of every effort for promoting the more universal circulation and reading of the Scriptures of Truth, without paraphrase or comment, but we have very decided objections to the titles of "the Word of God," as applied to the Scriptures, and of "Leaves from the Tree of Life," applied to the tracts. Both are calculated to inculcate unsound and hurtful views in the minds of readers, leading them to ascribe to the Bible what belongs solely to Christ the Word, that was in the beginning, which was made flesh, and dwelt amongst men, by whom all things were made, in whom was life, and who remains to be the only source of that life, which is the light of men.

Anything calculated to induce those who are seeking to know the truth for themselves, to look to the Scriptures for that which can only be brought to them by the grace of God, must confuse and hinder them in their striving to enter the straight gate, and to walk in the narrow way, and we are persuaded that the ascription of the above titles to the Scriptures, or to any part of them, has this effect.

We can freely unite with other denominations of Christian professors in adopting the apostle's testimony, that "all Scripture is given by inspiration of God, and is profitable for doctrine, for reproof, for correction, for instruction in righteousness; that *the man of God* may be perfect, thoroughly furnished unto all good works;" but we have a testimony to bear against the long-continued error of ascribing to the Scriptures, what they declare to belong exclusively to their Divine Author. It would be well for those concerned in perpetuating and spreading this error, seriously to consider how far it may be instrumental in preventing a practical belief in the eternal Word, which the apostle Peter told the believers in his day, was by the gospel preached unto them.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to the 3d inst.

Lord Clarendon's despatch, in answer to Secretary Marcy's last note, was laid before Parliament on the 2d. The debate on the motion for a vote of censure against the government for the fall of Kars, was pressed to a division, but the motion was lost by a large majority. The treaty between England, France, and Austria, guaranteeing the independence and integrity of the Turkish Empire, had been presented in Parliament. The bullion in the Bank of England continued to decrease. The London money market was more stringent. Consols, 93⅜. The Liverpool cotton market had been dull. Sales of the week, 42,000 bales; prices had declined ⅛*d.* Flour and wheat had advanced slightly.

FRANCE.—The expedition to Madagascar seems to be given up for the present. It is also stated that it will not be undertaken unless in concert with, or with the consent of England. The Minister of Justice and the Minister of War have sent instructions to the law officers and Gendarmerie to redouble their vigilance with secret societies. It is the law in France, that men drawn for the military service, must either serve themselves, procure a substitute, or pay a certain amount to the government. The sum paid into the treasury in this way amounted, during the continuance of the late war, to 62,400,000 francs, representing 22,285 substitutes.

The Peace Congress.—The official proceedings of the Peace Congress, just published, prove that the most interesting feature happened after the treaty was signed, in an interchange of sentiment upon various subjects of European interest. This interchange of opinions was invited by Count Walewski, who, among other things, referred to the disturbed state of Italy, recommending that suggestions for a milder rule be conveyed to the Italian governments, in which suggestions the Plenipotentiaries heartily agreed. Count Cavour, on behalf of Sardinia, demanded that a Secular Government be established in the Roman Legation, and that the Austrian troops be withdrawn. Sharp words ensued between the Austrian and Sardinian Representatives, but it ended in nothing. The Plenipotentiaries then proceeded to the discussion of the new declaration of the maritime law in reference to neutrals, &c., and to all the principles of this law, the Plenipotentiaries gave their adhesion, Russia qualifying her assent in the matter of privateering.

ABYSINIA.—This portion of Africa appears to be now ruled by an energetic despot. A letter from Alexandria,

Egypt, under date of Fourth mo. 9th, says, "The news which lately reached here from Abyssinia represents the Emperor Theodosius I. as deeply engaged in new schemes of conquest. He is determined, it would seem, to subject the whole of Africa to his sway, and to convert its inhabitants to a religion of his own liking. He has abolished male servitude throughout his dominions, but still keeps the women in slavery, regarding them as inferior beings. A Copt of Cairo has been appointed Patriarch of the dominions of his sable majesty, and encourages the Emperor to massacre all those who refuse to become converted."

UNITED STATES.—*Congress.*—The two Houses have agreed upon the Deficiency Appropriation bill, after striking out the appropriation for the Washington aqueduct. Bills have passed, granting public lands to aid in the construction of railroads in Michigan, Louisiana, Florida, Mississippi and Wisconsin, requiring in all about six millions of acres. The discussions continue upon Kansas affairs and other topics, but the amount of legislative labour performed during the five months of the session, is but small. Recently only eight public bills and a few private ones had passed both branches. The bills for the Improvement of the Mouth of the Mississippi river, and the Flats of the St. Clair river, have been vetoed by the President. He regards them as part of a general system of internal improvements, and refers to his message of 1854, vetoing the River and Harbour bill.

Recognition of the Walker Government in Nicaragua.—The President has finally concluded to receive the Padre Vigil, who had presented himself at Washington, accredited as the Minister from Nicaragua, to the United States. The President justifies the recognition on the ground that the government which Vigil claims to represent, is the only one having any pretensions to existence in that country, and that there are imperative special exigencies, which require that the United States should enter at once into diplomatic relations with Nicaragua. On account of the troubled condition of affairs in that quarter, the U. S. steam frigate Susquehanna has been despatched to San Juan.

The Indian Wars.—Among the documents laid before the Senate by the President, is a letter from General Wool, under date of Third mo. 20th, in which he says, The war on Puget's Sound will soon be brought to a close, unless prevented by Gov. Stevens' determination to carry on the war independent of the United States troops, and that the same remark is applicable to Gov. Curry; adding, that these governors appear to be running a race to see who can dip deepest into the public treasury. "In the dense forest of Puget's Sound, another Florida war can easily be carried on, at an expense of twenty or thirty millions of dollars. The same will apply to the mountain region and Puget's Sound Valley. I have no doubt I could settle the contest in a short time, if the governors would withdraw from the contest." The governors on the other hand are loud in their complaints of Gen. Wool, for refusing to co-operate with them. In Florida, there are now ten companies of regular troops and five companies of mounted volunteers, in all about twelve hundred men, for the purpose of capturing or destroying the few Indians, yet remaining in the peninsula. It is supposed they do not number a hundred warriors altogether.

Kansas.—At the latest advices, the Congressional committee was taking testimony at Leavenworth. A despatch from St. Louis says, that indictments for high treason have been found against Gov. Reeder, Gov. Robinson, and other Free State men.

New York.—Mortality last week, 362. The exports of specie for the week, were $1,564,415. A cargo of Irish potatoes arrived during the week from Liverpool, and found a ready sale at $1.25 per barrel.

Philadelphia.—Mortality last week, 194, viz. 88 adults and 106 children.

California.—On the 16th, the steamer George Law arrived at New York, from Aspinwall, with California dates to the 21st ult., and $1,700,000 in gold. The steamer Senora which left San Francisco on the 21st ult., brought to Panama over $2,000,000 in treasure. The citizens of Panama have taken measures for the protection of property, and the authorities had placed a force at the disposal of the railroad company, so that no further violence was anticipated. A terrible accident has occurred on the Panama Railroad to the passengers, who went out from New York, in the George Law. The train was thrown off the track on the Obispo bridge, about fifteen miles from Panama. It consisted of nine cars, containing 900 passengers. Owing to the accident, the passage through could not be effected, and the passengers were sent back to Aspinwall. Over fifty wounded had arrived, two of whom died after reaching Aspinwall. The next morning there was a further arrival of the wounded and uninjured. At the latest advices brought by the George Law, the wreck had not been wholly cleared from the road, but thirty bodies had been recovered. There had been heavy rains throughout California during the previous fortnight, which had given mining operations a new start. The grain crops were promising. The governor had signed the bill consolidating the city and county of San Francisco. The papers furnish but little news, except the Indian troubles in Oregon and Washington Territories. A body of regulars had been defeated by the Indians on Rogue River, with the loss of twenty-eight killed. The capture and burning of Cascades by the Indians, is confirmed. On other occasions the Indians had been defeated. In Washington Territory, the Indians were attacking the settlements in every direction.

Miscellaneous.—*The Growing Wheat Crop.*—Advices from all the Western States, with the exception of Tennessee, speak of the fine appearance of the wheat, which is expected to be twenty-five per cent. larger than any ever gathered in the United States.

The Peace Congress' Doctrines Prevailing.—The most sensible feature of the whole proceedings of the conference of the European Plenipotentiaries, is the conclusion at which the conference arrived, that, in the event of any serious misunderstanding arising between any of the Powers, they shall, before appealing to arms, have recourse to the good offices of a friendly power.

The Libel Law.—*Law of Pennsylvania*, provides "that from and after the passage of this act on the trial of indictments for writing or publishing a libel, the truth of the matter charged as libellous may be given in evidence, and if the jury in any such case shall find that the same was written or published from good motives and for justifiable ends, and that the matter so charged was true, it shall operate to the acquittal of the defendant or defendants."

High Water in Mississippi.—The heavy rains at the beginning of the present month, have done much damage in the interior of Mississippi, swelling the water courses, flooding the lowlands, sweeping away fences, bridges, &c., and submerging the young crops of cotton and corn. On the 3d instant, the Chickasaha river, at Enterprise, had risen 56½ feet, overflowing its banks, and covering the road between East and West Enterprise to a depth of eight feet.

Manumission.—The Colonization Herald says, about six hundred applications have been received by the Pennsylvania Colonization Society for a passage in the expedition to sail on the first of June next, from Savannah, of whom the great majority are slaves, who are to be manumitted for the purpose.

Progress of Temperance.—The Norfolk Herald says, the U. S. ship Portsmouth which had just sailed from that port for the East Indies, has entirely dispensed with the spirit rations by the voluntary arrangement of the crew, being the first U. S. ship which ever left the port under such regulations.

American Printing Presses.—The steamer Ericson, on her last trip from New York to Liverpool, took out one of Hoe's celebrated presses, for the London Times. Six men were sent out with the press as "feeders," accompanied by a foreman. The great rapidity of this press makes it indispensable to papers of large circulation.

A Great Contrast.—It is said that land in Missouri, twenty-five miles from Keokuk in Iowa, and looking to that town for a market, can be bought for $3 an acre, in any quantity, while land no better, is worth, in Iowa, at the same distance from Keokuk, $15 to $20 an acre.

A Great Improvement.—In Sardinia, which is now one of the most liberal governments in Europe, there was a regal decree issued in 1825, that no one should be allowed to read and write who was not in possession of 1500 livres.

INSTITUTE FOR COLOURED YOUTH.

The Annual Meeting will be held at the Committee-room on Arch street, on the 27th of Fifth month, 1856, at 3 o'clock, P. M.

M. C. Cope, Secretary.

WEST-TOWN SCHOOL.

The Committee charged with the oversight of this Institution, will meet at West-Town on Fourth-day, the 4th of next month, at 10 o'clock, A. M.

The Committee on Admissions meet on the same morning, at 8 o'clock, and the Committee on Instruction, on the preceding evening, at half past 7 o'clock.

The Visiting Committee meet there on Seventh-day afternoon, the 31st.

Thomas Kimber, Clerk.

Died, Third month 4th, at the residence of her son-in-law Joshua Pine, Gloucester county, below Woodbury, N. J., Sarah Thorne, in the 82d year of her age; a member of the Northern District Monthly Meeting of Philadelphia.

Died, on the 19th of Third month, 1856, at her residence in Upper Darby, Delaware county, Pa., Jane Cassett, aged 71 years: an esteemed elder and member of Chester Monthly Meeting. She was an example of reverence in the attendance of our religious meetings, under many bodily infirmities, and her countenance spoke the deep introversion of her mind therein. During her last illness, which was short, her expressions gave evidence of her resigned, peaceful and calm state of her feelings, saying, in prospect of the solemn period being near, that her mind felt "quiet and very comfortable," while many other remarks showed that her hope and confidence were in Him whom she had proved to be a present helper in every time of need, and that his divine presence was near to support, leaving her friends with the consoling evidence, that their loss is her eternal gain.

——, on the 22d of Third month, in the 55th year of her age, Ann Smith; a member of the Northern District Monthly Meeting. That it is not in man that walketh to direct his own steps, was abundantly made manifest in the experience of this beloved Friend; having been, during a lingering indisposition, a quiet acquiescence and resignation of her own will to the government and direction of her Father in heaven. Naturally cheerful and affectionate, she drew around her the society of many friends to whom she was tenderly attached, possessing a sound and discriminating mind she was frequently resorted to for judgment and counsel. The following extracts from memorandums found after her decease, furnish evidence that the day's work was kept pace with the day. Ninth month, 1855.—"I have latterly been reduced with a tedious inflammation, from which I have slowly in part recovered, and my slender life again lengthened by God, who gave it."

> I thank thee, Father, that thou giveth
> The strength whereby my spirit liveth
> From day to day.

"Whatever trials may yet be permitted, whether bodily or mental suffering, I pray to be kept in faithful submission to thy holy will;" then, after enumerating some choice blessings, she adds, "but the crowning blessing is the extension of the Lord's goodness in the comforts that delight my soul." Eleventh month.—"In this protracted confinement of seventeen years, being deprived of the privilege of independent effort, (which those who enjoy cannot fully appreciate,) I feel the need of waiting unto prayer, that I may be kept in the hour of temptation. There is an inward work to be carried on between the soul and its Maker, and I have long since found that my peace and safety consists in waiting on my dear Lord and Master morning by morning, till he is served to be fed with the crumbs from his table, and petitioned heavenly help to fill up my measure of secluded service and allotted suffering, that I may bring forth fruit with patience, and submissively endure to the end." To that know thy name, will put their trust in thee, for thou Lord, hast not forsaken them that fear thee. On the 13th of Third month, she was taken ill with erysipelas, but her mind was preserved in its usual serenity. A few days after, in conversation with a friend, she said with great earnestness, "This is to be my last sickness. I have thought of death more than any one knew, indeed it is so familiar to me that it seems only like stepping from one room to another. I have had a natural shrinking from it, but it has lost all its terrors; during the past year, I have felt more and more loosened from the world, with my feelings turned heavenward.

> 'Thither all my wishes bending
> Thither all my hopes ascending.'

And what an unexpected privilege it is to go so soon and be with Christ." Speaking of an intimate friend whose recent death had been a great trial to her, she said, "Her loss has been all made up; I have the same Saviour she had, and I know if she were here, she would say, Trust in him." As the disease increased, deeply affecting her mouth and throat, it became very difficult for her to articulate distinctly, yet she was enabled to endure much bodily suffering with great fortitude and patience, steadily looking forward to that rest which is prepared for the people of God; as her life had been one of quiet submission, so her death was calm and peaceful. "Let me die the death of the righteous, and let my last end be like unto theirs."

——, on the 30th of Fourth month, after an illness of four weeks, Thomas Smith, in the 64th year of his age; a member of Northern District Monthly Meeting, and brother of Ann Smith.

From the Quarterly Review.

Zoological Sketches.

(Concluded from page 296.)

his splendid collection has been got together by ents, purchase, breeding, and exchanges. Out he 14,205 specimens, however, which have been he possession of the Society, scarcely a tithe e bought. The Queen, especially, has been t generous in her presents, and the stream of baric offerings in the shape of lions, tigers, leo- ds, &c., which is continually flowing from tropical hoes to the fair Chief of the nation, is poured these Gardens. Her Majesty evidently pays heed to the superstition once common among people, that a dynasty was only safe as long as lions flourished in the royal fortress. In fact, Gardens are a convenience to our gracious narch as well as to her subjects; for wild ani- ds are awkward things to have in one's back mises. Neither must we overlook the reproduc- h which has taken place in the Gardens; to h an extent, indeed, has the stock increased, t sales to a large amount are annually made. e system of exchanges which exists between the ious British and Continental Societies helps to ply the Garden with deficient specimens in place duplicates. Very rare, and consequently ex- sive, animals are generally purchased. Thus, first rhinoceros cost £1000; the four giraffes, 00, and their carriage an additional £700. The phant and calf were bought in 1851 for £800; d the hippopotamus, although a gift, was not ought home and housed at less than £1000—a n which he more than realized in the famous hibition season, when the receipts were £10,000 ove the previous year. The lion, Albert, was pur- ased for £140; a tiger in 1852 for £200. The lue of some of the smaller birds will appear, wever, more startling: thus, the pair of black- cked swans were purchased for £80 (they are w to be seen in three-island pond); a pair of wned pigeons and two maleos, £60; a pair of ctoria pigeons, £35; four mandarin ducks, £70. ost of these rare birds (now in the great aviary) me from the Knowsley collection, at the sale of hich, in 1851, purchases were made to the extent £985. It would be impossible from these prices, wever, to judge of the present value of the ani- als. Take the rhinoceros, for example: the first ecimen cost £1000, the second, quite as fine a ute, only £350. Lions range again from £40 to 80, and tigers from £40 to £500. The price is nerally ruled by the state of the wild beast mar- ket and by the intrinsic rarity of the creature. A first appearance in Europe of course is likely to draw, and is therefore at the top price; but it is wonderful how demand produces supply. Let any rare animal bring a crowd to the Gardens, and in a twelvemonth numbers of his brethren will be generally in the market. The ignorance displayed by some persons as to the value of well-known objects is something marvellous. We have already spoken of the sea-captain who demanded £600 for a pair of pythons, and at last took £40! On another occasion an American offered the Society a grizzly bear for £2000, to be delivered in the United States; and, more laughable still, a moribund walrus, which had been fed for nine weeks on salt pork and meal, was offered for the trifling sum of £700!

We could go on multiplying *ad nauseam* instances of this kind, but must conclude the catalogue of absurdities by stating that there is a firm belief on the part of many persons that it is the Zoological Society which has proposed the large reward, which every one has heard of, for *the* tortoise-shell Tom. "The only one ever known" has been offered accordingly at the exceedingly low figure of £250. On one occasion a communication was received from some person of consideration in Thuringia, requesting to be informed of the amount of the proffered prize which he was about to claim. This was shortly followed by a letter from another person, evidently written in a fury, cautioning the Society against giving the prize to the previous writer, as he was not the breeder of the cat, but was only trying to buy it for less than its value, "in which he would never succeed as long as the true breeder lived." To prevent further applications on the behalf of growers of this unique animal, we may as well state that tortoise-shell Toms may be had in many quarters. There is one for sale at the present moment at Dudley for a very moderate price, if any of our maiden lady readers should wish to possess an animal which "everybody says" is so exceedingly rare.

We have said that the value of animals depends upon the state of the wild-beast market. "Wild-beast market!" exclaims the reader; "and where can that be?" Every one knows that London can furnish anything for money, and, if any lady or gentleman wants lions or tigers, there are dealers in Ratcliffe Highway and the adjacent parts who have them on the premises, and will sell them at five minutes' notice. They "talk as familiarly of lions as ladies do of puppy dogs;" and a gentleman, who purchased a bear of one of them, lately informed us that the salesman coolly proposed that he should take him home with him in a cab! We once had occasion to visit the establishment of one of these dealers, and were shown up a ladder into a cockloft, where, hearing a bumping, and perceiving a lifting motion in a trapdoor, we inquired the reason, which called forth the dry remark that it was only three lions at play in a box below. Although these men generally manage to secure their live stock in a satisfactory manner, yet accidents will occur in the best-regulated lion-stores. A wild-beast merchant, for instance, informed us that one night he was awakened by his wife, who drew his attention to a noise in the back-yard, where he had placed two lions on the previous evening. On putting his head out of the window,—his room was on the ground-floor—there were the lions, loose, and, with their paws on the window-sill, looking grimly in upon him. A good whip and a determined air consigned Leo to his cage again without further trouble. On another occasion this same man, hearing a noise in his back premises, found to his horror that an elephant, with his pick-lock trunk, had let out a hyæna and a nylghau from their cages, and was busy undoing the fastenings of a denfull of lions! The same resolute spirit, however, soon restored order. Amateurs have not always the same courage or self-possession, and they immediately have recourse to the Garden folks to get them out of their difficulties, as a housekeeper would send to the station-house on finding a burglar secreted in his cellar. On one occasion a gentleman, who had offered a rattle-snake and its young to the Gardens at a high price, sent suddenly to the superintendent to implore immediate assistance, as the said snake, with half a score venomous offspring, had escaped from their box and scattered themselves in his nursery. The possessor, to avoid worse losses, was only too glad to be rid of his guests at any pecuniary sacrifice.

We cannot close our survey without touching upon the cost of the commissariat. The slaughtered beasts appropriated to the carnivora, we have before stated, cost in the year 1854 no less a sum than £1367 19*s.* 5*d.* If we go through the other items of food, we shall give some notion of the expense and the variety of the banquet to which the animals daily sat down during that year. Thus we see hay figures for £912 14*s.*; corn, seeds, &c., £700 8*s.* 8*d.*; bread, buns, &c. (for the monkeys), £150 16*s.* 8*d.*; eggs, £87 4*s.* 1*d.* (for the ant-eater principally); milk, £69 6*s.* 2*d.*; mangel-wurzel, carrots, and turnips, £22 6*s.*; dog-biscuit, £135 19*s.* 10*d.* (for the bears and wolves and dogs chiefly); fish (for the otters, seal, pelicans, &c.), £214 8*s.* 8*d.*; green tares, £23 16*s.* 8*d.*; rabbits and pigeons (for the snakes), £33 13*s.* 2*d.*; rice and oil-cake, £66 15*s.*; sundries, including fruit, vegetables, grass-hoppers, snakes, mealworms, figs, sugar, &c. (for the birds principally), £157 1*s.* 11*d.*: making a total of £3942 8*s.* 3*d.*; a great increase on the food bill of 1853, and which is caused entirely by the advance of prices.

The pitch of excellence to which the Gardens have arrived has naturally resulted in drawing the increased attention of the public towards them. We have only to contrast, for instance, the number of people who entered in the year 1848—the first in which a more liberal system of management came into play—with those who passed in in 1854, to see that the establishment flourishes under the auspices of the new secretary; for while in the former year only 142,456 persons passed through the turnstiles, the number had risen in the latter to 407,676. It is interesting to observe that, although an increase of full 100 per cent. took place upon the privileged and ordinary shilling visitors during that interval, yet that the reduction of the admittance-charge to sixpence on Mondays and holidays was the main cause of the gradual influx of visitors—the year

1848 showing only 60,566 admittances of these holiday folks and working-people to 196,278 in 1854. Here, then, we have an increase of 135,712 persons, many of whom were, no doubt, rescued, on those days at least, from the fascinations of the public-house. With all this flood of life, the greater portion of it undoubtedly belonging to the labouring-classes, not the slightest injury has been done to the Gardens. A flower or two may have been picked, but not by that class of Englishmen who were once thought too brutal to be allowed access unwatched to any public exhibition. Every year that passes over our heads proves that such shows as these are splendid examples of the method of teaching introduced by Bell and Lancaster; that they furnish instruction of a nature which is never forgotten, and which refines at the same time that it delights.

Selected for "The Friend."

Hugo Grotius, a native of Holland, was born in the year 1583. He is said to have possessed the brightest genius ever recorded of a youth in the learned world. Nature bestowed on him a great comprehension, a solid judgment, and a wonderful memory; and these extraordinary natural endowments, had all the advantages that education could confer upon them. In short, he was a person of very eminent talents, and he is highly celebrated for his extensive learning and universal knowledge. "He was a light," say the statesmen; "a light," say the churchmen, too; witness his annals, and his work, "De Jure Belli et Pacis;" his "Truth of the Christian Religion," and elaborate "Commentaries on the Scriptures."

After all his attainments, reputation, and labours, he winds up his life and choice in this memorable declaration. "I would give all my learning and honour, for the plain integrity of John Urick, who was a religious poor man, that spent eight hours of his time in prayer, eight in labour, and but eight in meals, sleep and other necessaries." To one who admired his great industry, he returned an answer to this effect:—"Ah, I have consumed much of my life, in laboriously doing nothing," and to another, that inquired of his wisdom and learning, what course to take, he solemnly answered,—"Be serious."

* * * When great talents and learning are, from pure motives, and in true humility, consecrated to the service of truth and religion, they become acceptable offerings in the divine sight, and often eminently promote the good of mankind. But when we misapply these qualifications, make them subservient to pride and vanity, or attribute to them an efficacy in producing virtue and happiness, that does not belong to their nature; they occasion us to consume our time in earnestly doing nothing, or that which is worse than nothing; and they lay the foundation for bitter regret in the winding up of life.

The worth and importance of those advantages are lamentably over-rated, if our estimation of them is so high, and pursuit so ardent, as to dispose us to undervalue, to postpone, or disregard, that most interesting injunction of our Lord; "Seek ye first, (early, and in preference to all other things,) the kingdom of God, and his righteousness;" remembering that this is "the one thing needful."

Whilst the mind is occupied with the variety and intricacy of speculation and literary engagements, and the heart elated with the flattering distinctions which they produce, we may not be sufficiently aware of the tendency to that fatal effect: but when the close of our day approaches, and the retrospect of life is made; when the ardour of pursuit has abated, and the delusions of vanity and passion are at an end; we shall form a true estimate of the worth of all sublunary attainments and possessions. We shall then, if not before, perceive that to have our conversation in the world, with simplicity and godly sincerity; to receive the kingdom of heaven as a little child; and to secure an incorruptible and immortal inheritance, are things of infinitely greater moment, than merely to possess all the accomplishments of mind and body that this world can bestow.

As it is, therefore, our highest wisdom, may it also be our greatest concern, seasonably to anticipate these reflections; and so to temper and regulate all our studies, and all the engagements of this life, that they may coincide with, and promote the great end of our being! — *From Lindley Murray's "Power of Religion on the Mind."*

For "The Friend."

Country Recreations.

At this loveliest of seasons, we sometimes feel an almost irresistible impulse to flee away from the dead walls and polluted atmosphere of the city, and get us into the free, broad domain of nature; that we may inhale the fragrance of the cool moist meadows and the budding woods. It seems almost a duty to be present, and to admire with grateful hearts the glorious handiwork of the bountiful Creator, when he is renewing all things with such ineffable beauty; when the woods, arrayed in their light transparent drapery of tender foliage, the rich, deep green of the pastures and grain fields, the blossoming orchards, the blue skies and sparkling waters, all lighted up with the resplendent sunshine, make the earth seem like a dream of heaven. Such scenes need no aid of poetical fancy, to render them almost as meet for the presence of those "spiritual creatures who walk the earth unseen," as are

> "Their blissful bowers
> Of amaranthine shade, fountain or spring,
> By the waters of life"—

for the earth seems no more cursed for man's sake, but bears on her beauteous forehead the signet of his almighty hand, whose throne is in heaven, and whose works everywhere praise him. The love of nature is inborn with most of us, and, when not developed, must either have been crushed in youth by a false education, or the want of opportunity to indulge it; or has been absorbed later in life by the eager pursuit of gain, and perhaps in many instances by a vitiated appetite for the corrupt pleasures of the world. Who has not noticed the delight of children in flowers; how they race through the deep, dewy grass after butter cups and dandelions, and enjoy the delicious sunshine, the fragrance, beauty, and melody of spring, with an ecstacy of feeling that they cannot express in words —dear little hearts! What a pity it is, and how unnatural, to have their bounding spirits, which seem so attuned to the sweet harmonies of nature, caged for so many hours in the day, so many weeks and months in the year, in the wearisome schoolroom. We forget that there is a book far richer in intellectual treasures than any furnished by the school library; a book that may be studied to the praise of the Great Author, and while the mind and heart are enriched and expanded, health is invigorated, and the nerves braced. There can be no doubt, that a certain amount of school exercise and discipline, if properly directed, is of great advantage; and indeed necessary for a complete education; but it is much to be feared that the zeal of the instructors, and the ambition of parents, often induce them to carry this point far beyond the bounds of prudence, and sound judgment; even to a degree of positive cruelty sometimes; so that health and happiness of children are impaired, if sacrificed. O that they would consider this subject and see how far they may be deranging the benign laws of adaptation designed by Providence to preserve a healthful tone to the system. It is a nice point, requiring a firm and enlightened judgment blended with the true spirit of benevolence, to know how to guide the natural impulses of children, to know when they should be controlled, and how far they may be innocently encouraged; to know when their faculties require rest, and when stimulation and exercise, and above all to know how to govern our own inclinations, so that we may not be led by the ambition of success, to exercise too far on their expanding minds. It is not my purpose, however, to write a treatise on education, but simply to recommend as an innocent relief from the monotonous life of too many of our youth, as one of the best antidotes to languid spirits, and occasional ramble into the country. I remember a teacher, who frequently used to take her pupils on little rural excursions, and would often infuse into our spirits, some of the enthusiasm which animated hers; while she taught us how to admire the grand and beautiful and the marvellous in the works of the Creator. I also remember strolls through woods and meadows, wild-flower hunting, led by the hand of a beloved parent; and well we, children, knew the favourite haunts of each of the lovely tribes. O how delightful were such little jaunts, when every bright blooming plant, we found was a jewel for the time being; no past scenes in my life are fraught with sweeter memories; such little lessons of the wonders of creation and providence, then dropped in words and tones of affection, when our hearts were in unison with surrounding scenes, were not soon lost. If teachers would more frequently indulge their charge in this kind of recreation, I think they would lose nothing by it; the advantage to their own health would amply compensate for the time it would take; and they and the children would work with renewed energy after it. They might also mingle with it, as far as the free, unrestrained spirits of children will allow, little lectures on botany, or natural history in general; and nature's grand living cabinet will ever furnish them with magnificent illustrations, fresh and perfect, from the hand of the Divine Author. Come then, teachers, or elder brothers or sisters; take the younger ones by the hand, and lead their bounding footsteps over the briery hill, through the deep grass of the flower-enamelled meadows, by the margin of the trickling streamlet, through the grand old woods, now putting on their bravery on; let them race hither and thither, ploughing the dry fallen leaves, where gleam around the old tree roots, the white stars of the anemone and sanguinaria; let them hunt for violets and mountain pinks on the grassy banks; clamber over rocks for the crimson columbine; through the thickets where glow the wild honey-suckles; and wade through the swampy meadows, after painted cups and flags; let them shout for joy, when they behold the sprays of the dog-wood flowers gleaming white, and the soft rosy flame of the Judas tree blushing like a sunset cloud; blending their exquisite delicacy of tints, with the light green of the young foliage, and the darker hue of the pine; all these, and myriads of others have come to nature's grand festival, each arrayed in perfection of beauty, and elegance of form and colour, distinctively their own, and infinitely various. If they want music, let them hush their noisy shouts awhile to listen to the joyous songs of the birds, blending in harmonious concert; let them watch their elegant motions as they flit from spray to spray; and

the minnows gambolling in the crystal brook,
the various tribes of insects,

They that wave their limber fans
For wings, and smallest lineaments exact,
In all the liveries decked of summer's pride
With spots of gold and purple, azure and green,"

each furnish entertainment and instruction.
What draughts of health-inspiring pleasure they
quaff, without the alloy which embitters time
spent; and they may thus cultivate a taste,
ch, harmonizing with their love of literature and
nce, will impart new zest to these pursuits, by
invigorating tone infused into the whole system;
it may even be a means of preventing a mor-
appetite for the poisonous pleasures of a cor-
world. Youth is the season when it is natural
every fibre of the frame should vibrate to the
s of joy, and when a kind Providence by the
ious feast he spreads abroad in nature, invites
to partake of it, with gratitude. Should our
dren not have the opportunity to do so? Should
daughters waste these golden hours in crochet
k or profitless reading, or in like sickly occupa-
ns? and if "much study is a weariness to the
h," should their young brains be crammed, at
time, with so much and so many branches of
until they become feverish, languid and dis-
ted. I hope the time will come when this cram-
g system will be abolished, or at least mode-
d, and that more frequent recreation during the
m months at least, may be allowed, while the
acity for such enjoyment remains; and "before
evil days come when they shall have no plea-
e in them." And then I think we should see
er pale faces and stooping forms among our
ng girls, and more of that innocent hilarity,
ich is appropriate to their years. We need not
r but the shadows of life, which are often so
utary, will fall upon them in due season, when
y need such chastening, without our contributing
make them prematurely old by too much re-
aint.

Chimney Swallows' Roosting Place.

The following interesting description of a visit to
ree where the chimney swallows resorted is given
John J. Audubon, the distinguished American
nithologist:

On my arrival at Louisville, Ky., I was shown
ree where the chimney swallows enter for the pur-
se of roosting. I found it to be a large sycamore,
arly destitute of branches, and some sixty or
enty feet high, and between seven and eight feet
diameter at the base. At the distance of forty
t up, it was five feet in diameter, and there a
llow branch, of some two feet through, had been
oken off, leaving a stump projecting from the
ain trunk. Through this hollow branch the
allows entered the tree.

After being shown this tree I rode home, but re-
rned to it again late on an afternoon, in the month
July. The sun was going down behind Silver
ills; thousands of swallows were flying closely
ove me, and three or four at a time were pitching
to the hole, like bees hurrying into their hive. I
aned my head against the tree, listening to the
aring noise made within by the birds as they set-
ed and arranged themselves. When it was quite
ark I left the place.

Next morning I arose early enough to reach the
ee long before the least appearance of daylight,
ad placed my head against it. All was silent
ithin. I remained in that posture probably twenty
inutes, when suddenly I thought the tree was
iving way, and coming down upon me. Instinc-
tively I sprang from it; but when I looked up at it again, I was astonished to see it standing as firm as ever.

But the swallows were now pouring out in a black continued stream. I ran back to my post, and listened with amazement to the noise within, which I could compare to nothing else but the sound of a large wheel revolving under a powerful stream. It was yet dusky, so that I could hardly see the hour by my watch, but I estimated the time which they took in getting out at more than thirty minutes. After their departure no noise was heard within, and they dispersed in every direction with the quickness of thought.

I determined to examine the interior of the tree, and for this purpose hired a man to cut a hole at the base. The shell was only eight or ten inches thick, and the axe soon brought the inside to view, disclosing a matted mass of exuviæ with decayed feathers, &c. I had a passage cleared through this mass for about six feet. This operation took nearly the whole day, and knowing by experience that if the birds should notice the hole below, they would abandon the tree, I had it carefully closed.

The swallows came as usual that night, but I did not disturb them for several days. At last, provided with a dark lantern, I went with my friend, about nine o'clock in the evening, determined to have a full view of the interior of the tree.

The hole was opened with caution, and I crawled through, followed by my companion. All was perfectly silent. Slowly and gradually I brought the light of my lantern to bear on the sides of the hole above us, when we saw the swallows, clinging side by side, covering the whole surface of the excavation; but in no instance did I see one bird above another.

Satisfied with the sight, I closed my lantern. We then caught as many as we wished, stowing them away in our pockets and bosoms, and slid down to the open air. After closing the entrance, we walked toward Louisville, perfectly elated with our adventure.

Let us now make a rough calculation of the number of swallows that clung to the side of the tree. The place covered by the birds was at least twenty-five feet in height, and fifteen feet in breadth; supposing the tree to average only five feet in diameter, there would then be three hundred and seventy-five square feet of surface.

Allowing each bird to cover a space of three inches by one and a half inches, which is more than the space, judging from the manner in which they packed, and each square foot would contain thirty-two birds. The number of swallows, therefore, that roosted in this single tree at once, was nine thousand.

Day after day I watched this tree, and about the middle of August not more than two or three hundred swallows came there to roost. On the 18th of the same month there were only a few scattering individuals, and these seemed hurrying southward. In September I entered the tree at night, but not one was in it. I visited it again in February, when the weather was perfectly cold, and became perfectly satisfied that these swallows do not spend the winter in trees; but that they emigrate southward on the approach of autumn.

On the following May I went to the old sycamore tree, and found the swallows once more returning to their old haunt. After five years had passed, I again visited this venerable tree, and saw the swallows still resorting to it. But the ancient tree at length yielded to the violence of a severe storm, and came to the ground. What became of the swallows that so long frequented it I know not.

There is more fatigue in laziness than in labour.

Epistle of George Fox.

My dear Friends,—The Seed is above all. In it walk in which ye all have life. Be not amazed at the weather; for always the just suffered by the unjust, but the just had the dominion. All along ye may see, by faith the mountains were subdued; and the rage of the wicked, and his fiery darts, were quenched. Though the waves and storms are high, yet your faith will keep you so as to swim above them; for they are but for a time, and the truth is without time. Therefore, keep on the mountain of holiness, ye who are led to it by the light, where nothing shall hurt. Do not think that anything will outlast the truth, which standeth sure; and is over that which is out of the truth; for the good will overcome the evil; the light, darkness; the life, death; virtue, vice; and righteousness, unrighteousness. The false prophet cannot overcome the true; but the true prophet, Christ, will overcome all the false. So be faithful, and live in that which doth not think the time long. 1670. G. F.

Apparatus for Dipping Sheep.—In a new English contrivance for this purpose, a galvanized iron cradle is first put over the sheep's back, and a couple of straps buttoned underneath him; a crane then lifts him up, and lowers him into the dipping tub, keeping his head uppermost. Being then hoisted up to drain, he is lowered on the ground and set at liberty. The object of this apparatus is to save men the unhealthy labour of dipping the animal, and at the same time preventing any tearing of the sheep's wool.

Profitable Hints.

It is a symptom of decline when a man will *unnecessarily* expose the imperfections of the religious world. This is the very opposite to the spirit of St. Paul, who speaks even weeping of those who mind earthly things.

One wrong step in the beginning of an important concern, like a wrong figure in the early part of a sum, may lead throughout into error.

True religion will show its influence in every part of our conduct; it is like the sap of a living tree which penetrates the most distant boughs.

It is wisely ordered that neither nations, [communities] nor individuals, can deteriorate each other without injuring themselves, nor promote the welfare of others without partaking of the benefit conferred.

Keep no company with a man who is given to detraction; to hear him patiently is to partake of his guilt, and prompt him to a continuance in that vice which all good men shun him for.

There is no readier way for a man to bring his own worth into question, than by endeavouring to detract from the worth of other men.

To criminate and recriminate never yet was the road to reconciliation.

No man ever did a designed injury to another, without doing a *greater* to himself.

The sweetest revenge is to do good to our enemies.

Parrots in Iowa.—It is said that numbers of parrots resort annually to Decatur county, Iowa, and are sometimes seen in flocks of twenty, and even more. Three of these birds were shot one week during the late cold spell. They are about the size of the common tame pigeon, though not quite so large round; their tails are shorter, their plumage is green, tinged on the back with blue; their wing-feathers are red and yellow, and the bill and tongue are the same as in all parrots. It is rather surprising to find these birds so far north, and feeling so much at home.

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 293.)

SAMUEL SPICER.

The great animosity of Governor Stuyvesant against the Quakers, probably arose in part from the fact that he could not make soldiers out of them. Whatever the cause, his fierce fury seemed ever on the increase, until the capture of the province by the English. This event was no doubt a cause of sincere rejoicing to many of the English settlers within the Dutch government.

In the year 1670, the township of Gravesend was confirmed by a new patent from the English government, and John Tilton and Samuel Spicer were two of the patentees. Samuel's good mother had probably deceased before this time, and he found the necessity of a wife. Through the directing influence of his heavenly Father, he found in Esther, a daughter of his valued friends, John and Mary Tilton, a help-mate in every respect. Samuel was a good practical farmer, and doubtless his wife was one well qualified to fill her station in helping him. By the tax bill of Gravesend township in 1683, we find that the farm he owned contained 100 acres. His stock by the same bill was 9 full aged cows; 3, three years old; 5, two years old; 6, one year; 3 working horses; 1, two years old; and 1, one year old.

In the year 1665, Samuel Spicer, who had, with other of his Friends at Gravesend and Flushing, taken up land about Sandy Hook, received a patent therefor from Governor Nicholls, of New York. Thither his brother-in-law, John Tilton, jr., did, after a time, remove. Samuel felt drawings, after William Penn had commenced the colony of Pennsylvania, to West Jersey, and about the year 1685, he removed thither with his wife and their four or five children. After their departure, their friends on Long Island sent a certificate of membership after them, which, being a little different from such things as prepared in the present day, we will introduce.

"To our dear and well beloved Friends, at their Monthly or Quarterly Meetings in West Jersey, or elsewhere.

"Whereas our dear friends, Samuel Spicer and Esther his wife, have seen cause to remove themselves and familyfrom Gravesend, on Long Island, (where they have long abode,) unto your parts to settle and inhabit, these may certify that they, the said Samuel and Esther his wife, have long been well known unto us, and among us; and to our great satisfaction we can say, that from their convincement unto this very day, we have not known of any misbehaviour concerning them, either to the blemishing the Truth they have professed with us, or towards their neighbours; but as far as we know, (and do believe,) they have been of honest conversation, and good patterns and examples, both amongst us, and also their neighbours; and will leave a good savour in the hearts of Friends and people that know them; and although they remove outwardly from amongst us, yet we hope our love and unity in the Truth shall abide towards them, and remain the same.

"At our Quarterly Meeting at Flushing on Long Island, this 29th of the Third month, 1686."

Samuel Spicer located himself on land adjoining Cooper's Point, nearly opposite Philadelphia, where some of his descendants still live. John Tilton, having lost his wife, no doubt felt the removal of his daughter Esther to West Jersey, keenly. One of his letters to her is still preserved.

Gravesend, 26th of Eleventh month, 1686.

Dear Child, Esther Spicer,—In the endless, holy love of God, night and day, art thou in remembrance with me. Through this free love, bounty and goodness, we are made near and dear unto each other, knowing him the giver thereof near us to love us. He hath, doth, and will have pity on us, under every exercise he suffers. Of this thou hast had good experience with many others; for which, praise his holy name, who hath made hard things easy, and bitter things sweet. May [we] be strengthened at all times and encouraged in heart and mind to have our whole trust and confidence in his love and his holy arm of power to relieve in whatever he may appoint or measure out for us. [May we] in all, ever look up to him, and have our eye on him from whence our help alone must come; on him cast our burthen; on him patiently wait; for he alone must be our helper and Redeemer, and in him must our faith and hope stand. All this I am instructed unto, and desire to be learned in, and this thou also knowest, [yet] I thought it not amiss so to remember thee of it. I have had some sharp exercises since I formerly wrote, by which the Lord having instructed and more made me to see myself for good, turned my cup into sweetness. Praised be his pure name for all.

Dear Daughter, I have been truly sensible of thy sorrows, and deeply affected. Dear Child, let nothing press down, which might hinder [thee] in the uncertain time we are here to continue. * *

As to thy dear children, Jacob, Martha, Abigail and Thomas,* my love is unto them all. May the Lord by his powerful and effectual working, gather them nearer and nearer unto himself, seasoning their hearts with his grace,—that his truth and the ways thereof, or the friends of it, be never an offence, hard or burthensome to them. May his word grow up in them, and his pure and holy love in their hearts so increase, that they may delight themselves in it, and in them that love it; even so, amen, is my wishing. Thy loving father,

JOHN TILTON.

Of Samuel Spicer's after life, we know little. He was at times representative to the Yearly Meeting, and we find him in Third month, 1689, signing a request on behalf of the Quarterly Meeting, held at Newton, to the Monthly Meeting of Philadelphia, to put a stop, as much as they could, to selling rum to the Indians. In the Yearly Meeting of 1698, he opened a concern for the gathering together what accounts could be collected of the travels and services of George Rofe in America. A committee was appointed on the subject, consisting of Samuel Spicer, his brother-in-law John Tilton, and William Southeby. At the Yearly Meeting of Ministers, held Seventh mo. 14th, 1700, the result of the labours of this committee was produced, being an account of "the trials and sufferings of George Rofe." It was directed to be sent to England, and probably was lost there.

This is the last trace of Samuel Spicer, which I can find. His death must have taken place in 1699 or 1700. The following minute from the records of Haddonfield, informs us of the death of his widow.

"Esther Spicer and Esther Saxby, her servant-maid, and Richard Thackera, the son of Thomas Thackera, of Newton, he being about eleven years, nine months and twelve days old, were slain by lightning on the 24th of the Seventh month, 1703,

* It appears that, Twelfth month 26th, 1695, Daniel Cooper married Sarah Spicer, daughter of Samuel and Esther Spicer. Perhaps, at the time of this letter, she may have been living with her grandfather.

they being in Esther Spicer's house, which sh
happened about the tenth hour in the even
They were buried at Newton, in Friends' bur
ground, on the 26th day of the same month."

It matters not how the Lord's servants are ta
away from this scene of probation; if they h
been walking in his fear, and seeking to perf
their duty in his sight, their removal through wl
ever passage effected, will be into his glorious r

(To be continued.)

Inventive Power of Man.

One of the most interesting and peculiar feat
of the human mind is its inventive faculty. It
create nothing; but it can skilfully combine
adapt, by which the inert materials on whic
works may assume new forms and motions,
elicit hitherto unknown powers. Air, fire, wa
wood, metals, may, by ingenious processes, be
shaped, arranged, and controlled as to become
it were, instinct with life and intelligence,, and p
duce results at once startling and wonderful.

Invention is a natural faculty, and yet it requ
favourable circumstances to bring it forth into a
vity. In a savage state, it is seldom taxed to
great extent; although the necessities of men w
in a measure, bring it into operation, and show t
it is obedient when appealed to. So also in nati
which are ground to the earth by oppression,
power for great achievements is seldom evok
When human governments encourage its devel
ment, and promises of certain reward are held
it becomes busy, and its results soon appear.
are accustomed to trace the hand of God in
external works of creation by which we are
rounded; but none of them, perhaps, exhibit s
wonderful evidences of his skill and wisdom as
human mind, when called forth in all its activit
and especially when exerting its power in con
vance. The very materials which lie use
around the savage, when touched by invent
genius, fall into form and order, and come forth
machinery adapted to all useful purposes, labc
saving and time-saving, and contributing to
comfort, safety, happiness, and highest civiliza
of the world. Even warlike inventions by th
terrible energy have diminished the frequency
destructiveness of unnatural contests between
tions. The inventions of peace are still more
fusive, and carry their benefits to tradesmen
all kinds, to families and nations.

It is only necessary to look around us for
evidences of the beneficial effects of human ingenu
Thus, for instance, we are to look to the prodi
of the soil for the means of subsistence. The na
ral fertility of two soils may be equal, and yet th
will be a vast difference in their yield under diff
ent systems of cultivation. If we look to the orie
plough, which is a clumsily pointed stick, throw
up two or three inches of the earth from the surfa
and to the method of winnowing by throwing up
grain by a hand-shovel, and depending on the w
to drive away the chaff; and to the earthen thre
ing floor, in which the grain is separated from
husk by the tramp of oxen; and then to the ha
mills, consisting of two stones moved over each ot
by manual labour; we see what agriculture is un
a low state of invention. Then if we look at
improved ploughs, cultivators, and harrows of m
ern times; to the grain planting, cutting, and thre
ing machines, and to the improved methods
grinding, we have a contrast which is marvell
We have seen half a dozen men in the heat of s
mer laboriously cutting grass and grain, with th
scythes and sickels, and as many more follow
with their hand-rakes; and we have since seen
mowing machine moving by horse-power over

r fields, and with surprising celerity prostrating
rops, while the horse-rake, with equal celerity,
rms its work in gathering; and our exclamation
been, what a saving of labour, time, and expense
been effected by the ingenuity of man! Great
the advance of the old country water-wheel
upon the manual process of grinding in ancient
s; but at what an immeasurable distance is it
behind by the modern mill improvements!
mill in Pittsburgh will, by its elevators, raise
the boats four thousand bushels of grain into
mill in one hour, and will then grind five hun-
barrels of flour in a day, and all this with com-
tively little exhausting effort on the part of a
men! Chemical science, too, now analyzes,
ifies, and enriches the soil, and thus greatly
eases its productiveness.

n another department, we may revert to some
ar mountain roads, which were slowly traversed
horseback, while goods to a small amount, on
k-horses or lumbering wagons, were transported
n town to town, expensively and slowly; and
on those same roads are laid the iron rails,
e the steam engine, with its tremendous power,
ws its lengthened train of passengers and freight
s many hours as it once cost days to perform
same operation on a minature scale. At not a
ote period a mail communication might be sent
n Philadelphia to Boston in about three weeks;
same communication may now be sent and the an-
r received in an hour by the electric telegraph.
s has inventive genius almost annihilated time
space. The man who had the boldness to visit
rope some years since, must make his preparations
a long voyage and a long absence; now, by the
il steamers, he may go and return in a month,
h some time to spare for sight-seeing.

Contrivance and skill have almost indefinitely
ltiplied the power which man now wields in all
useful arts. Look at the slow process of spin-
g and weaving by which our ancestors made
ir coarse fabrics, and then compare them with
spinning and weaving machines of present times,
ven by the power of steam, and producing the
st fabrics, in the greatest abundance, in the very
rtest time. The feats of mythical fairies of old
es are surpassed by the perfect and almost in-
ligent machinery of the present. There was a
e when the rich alone could own a book, and
t, too, after the invention of printing; but who
so poor that he cannot now own a book? We
n remember standing in amazement by a hand
ss in a printing office, to see the man with his
c balls going over the types, and the pressman's
scular force applied to bring down the pressure
the sheets. It was wonderful to see a sheet
us printed in several minutes; but now the steam
ess is at work, and its result are almost incredi-
e. For instance, the Hoe press will print twenty
ousand copies of a sheet on one side in a single
ur. The paper, too, which was once made by
nd, is now made by machine, which rolls it forth
a continuous sheet, miles in length if required.
hese processes are deeply interesting, and might
e regarded as the *ne plus ultra* of mechanical
ill.

We forbear. Space would fail if we should at-
mpt a reference to the tithe of mechanical inven-
ons which are found in every artizan's shop, and
hich bring comfort and luxury to every family.
f man is capable of accomplishing such feats of
kill, how sublimely wonderful must be God, who
as endowed his mind with such faculties!—*Pres-
yterian.*

Humility and knowledge in poor garments, excel
ride and ignorance in costly attire.

For "The Friend."

William Dewsbury.

(Continued from page 296.)

Disappointed in finding among the Puritans, and other high professors what his conflicting spirit earnestly sought, he seemed prepared to take up with almost any presentation, which appeared to offer some hope of relief to his exercised mind. About the year 1642, and the twenty-first of his age, his apprenticeship drawing to a close, he was caught, like many other serious persons, with the apprehension it would be right to enter into the Parliament army, who pretended they fought for the gospel. Because all were not so ready to unsheath the sword, as some deluded persons wished, they raised the cry, "Curse ye, Meroz," to induce them to engage in the conflict for the cause of civil and religious liberty, which they called going up to the help of the Lord against the mighty. In the peculiar state of his mind, William Dewsbury was taken with this bait, and he was willing to expose himself to death, if by such a measure it was possible to free his soul from sin, escape the condemnation he then lay under, and thus attain to reconciliation with his Maker. Not seeing the inconsistency of Christians taking the sword—of professing to be disciples of Christ, and at the same time acting in a manner diametrically opposed to his example, his precept, and his spirit, and not regarding his declaration that he came not to destroy men's lives, but to save them, he joined a remnant, as he termed them, who professed to fight for the defence of religion. But not being under the guidance of Divine wisdom, whatever way he turned in his own will and determination, disappointment still followed him. He entered the army under expectation of meeting fellow-travellers, whose main pursuit was similar with his own, and who had passed through similar baptisms; but in this he was deceived. He found as much ignorance of the gospel in its real spiritual acceptation, and of Christ, as he had ever met with before. Not satisfied with this position, he next made a journey into Scotland, in search of those who there walked in the fear of the Lord, and came to Edinburgh, where he tells us he found nothing but formality; the teachers calling people to seek the kingdom of God in outward observances. Wherefore he returned to England, and sought for Him whom his soul loved and longed for, among the Anabaptists and Independents. These, he tells us, "said they were the children of God," and were setting up a more glorious image in outward things. But he was not free to join them, for it was the testimony of the love of God to his soul that he wanted, and was in search of.

"Then," says he, "the Lord discovered to me, that his love could not be attained to by anything I could do, in any of those outward observations; and in all those turnings in my carnal wisdom, while seeking the kingdom of God without, thither the flaming sword turned, to keep the way of the tree of life; fenced me from it, cut me down, rent all my coverings, and destroyed that mind which thus looked out to find the kingdom of heaven. Then my mind was turned within by the power of the Lord, to wait in his counsel, on the light in my conscience, to hear what the Lord would say. And the word of the Lord came to me, and said, 'Put up thy sword into its scabbard; if my kingdom were of this world, then would my children fight; knowest thou not that if I needed, I could have twelve legions of angels from my Father?' which word enlightened my heart, and discovered the mystery of iniquity; it showed the kingdom of Christ to be within, and that its enemies being within and spiritual, my weapons against them should also be spiritual—the power of God." Being at last favoured with these clear intimations of the will of the Lord concerning him, and which were in accordance with the Holy Scriptures, W. Dewsbury no longer hesitated as to the course it was right for him to pursue. Not feeling himself now at liberty to engage in the destruction of his fellow-creatures, and that too under the mistaken notion of advancing the kingdom of Christ, (enthusiasm, indeed, of the most dangerous character,) he left the army, and laid aside his sword altogether.

Having happily accomplished this resolution, he turned his steps homewards, and there laboured at his previous occupation of cloth weaver; but of his pursuits in trade he makes little or no mention, and we are left to conjecture both as to their extent, and his success and prosperity in regard to them. He informs us, however, that his mind was inwardly engaged, while labouring with his hands, in waiting on the Lord in the way of his judgments, until his own will was brought into subjection to the divine will. Many Scripture types were, from time to time, opened to his understanding, greatly to his own instruction; chiefly those which, in the character of Cain, Esau, Pharaoh, Egypt, &c., set forth the condemnation that the man of sin is under, showing how the carnal mind is not, neither can be, subject to the law of God. Under an inward sense and feeling that he was himself, by nature and transgression, involved in the same condemnation, he was brought to the determination of unreservedly casting himself upon the mercy of God in Christ Jesus, and of yielding all up to his disposal, whatever that might be, whether to condemn or to save him; if the former should be consistent with his will, he could but acknowledge it would be just; if the latter, it was of his free love.

About this time it appears that W. Dewsbury received, greatly to his encouragement, a clear and satisfactory insight into the nature of the several dispensations of divine mercy to mankind, the result of which was, that while he lay in the "condemned estate," bewailing himself in the depth of his misery, without any hope of deliverance by anything he could do to pacify the wrath of God, he was favoured with a clear evidence in the secret of his soul, that there was free redemption laid up for him in the Lord Jesus, and encouragement was ministered even in this condemned state, to wait for his coming, who, "in the appointed time of the Father," says he, "appeared to my soul, as the lightnings from the east to the west, and my dead soul heard his voice, and by his voice was made to live, who created me to a lively hope, and sealed me up in the everlasting covenant of life with his blood. Then I witnessed the wages of sin to be death, and the gift of God, eternal life through Jesus Christ, my Lord. Death reigns over all from Adam to Moses, and there is no rest to the soul, till Christ be manifested. This the Scriptures witness; and I witness these Scriptures to be fulfilled in me." The foundation which was, from the first, laid in his mind for the necessity of the great work of regeneration, by that deep sense of the depravity and sinfulness of man, is especially worthy of our notice; coupled as it is with the important fact, that he learned this truth as to his own particular, from those powerful and deep impressions secretly made upon his mind, without the intervention of the ordinary means of religious instruction. Those evidences of immediate communication to his mind, which he esteemed to be divine, and under which his faith was exercised from first to last, fully warranted the strong language which he mostly employed, in describing his views of the work of God on the soul.

For thus conveying their own experience with regard to inward, immediate revelation, Friends

were subjected to a load of unjust censure, and the flood gates of controversy were opened upon them from almost every quarter, exposing them to unmerited ridicule and abuse. But in the progress of the work of regeneration, which is not less a real and effectual, than an inward and mysterious work, an understanding is given, in and by which the "new creature" is enabled to receive the mysteries of the kingdom of heaven. Not, however, in their own wills, and at all times when they sit down to search the Holy Scriptures, but as those writings are opened to the mind, and brought to their remembrance, by Him who knows their state of growth, what it stands in need of, and what it is able to bear. These views, however, did not prevent the body of Friends in the early times, from placing an equally high value on the Holy Scriptures with their contemporaries. They received these writings no less than the high professors of their day, as given by inspiration of God," and profitable for those ends for which they were designated; namely, "for doctrine, for reproof, for correction, for instruction in righteousness, that the man of God may be perfect, thoroughly furnished unto all good works." And they believed them "able to make wise unto salvation, through faith that is in Christ Jesus." Faith in this sense is a very comprehensive term. W. Dewsbury says, "For the sake of the simple, we do declare that which is witnessed by all the children of light—that the word of faith is in the heart and in the mouth, and those who are guided by it, are kept pure. Faith purifies the heart, whether they have the outward declaration, yea or nay. And those who have the outward declaration, though they read it, if they mind not the Word which is life and light, which gave forth the Scriptures, do not live according to the Scriptures; for they who are not guided by the Word, have not faith. Faith comes not by a bare reading of the outward declaration, but is the gift of God to his children, who diligently hearken to his Word, which is life, and the life is the light of men." Christ is the author and the finisher of the saints' faith, which is of the operation of his Spirit in the heart. "None come to the knowledge of the Father by reading the Scriptures, if they come not to Christ, of whom they testify, and in whom the life is; who saith, 'Search the Scriptures, for in them ye think ye have eternal life, and they are they which testify of me;' and he reproves all those who will not come to Him that they may have life."

(To be continued.)

English and French Agriculture.—An article, in a late number of the Edinburgh Review, gives some curious and instructive facts in reference to the agriculture of France and Great Britain. The former country, in spite of having the finest climate, actually produces less, per acre, than the latter, for while the average yield of wheat in France is thirteen and a half bushels to the acre, in the United Kingdom it is twenty-eight bushels.

The cause of this inferiority is the comparatively slovenly farming of France. Though Great Britain has one-fourth less population and soil, the number of cattle in that kingdom is nearly equal to those in the empire. The results are two-fold. Firstly, a much smaller proportion of the soil in France is laid down in those pastures, roots and artificial grasses, used in raising cattle; and secondly, the supply of natural and artificial manures is less abundant than in Great Britain. Moreover, the rotation of crops being less perfectly understood and practical, about one-eighth of the arable land is left fallow each year. In the British isles, out of about forty-six millions of acres under cultivation, thirty-six millions are devoted to growing food for live stock, and but ten millions to food for man; but in France, twenty millions only are given to the ameliorating crops, while the exhausting crops, or those which give food to man, occupy forty millions. With fewer acres under cultivation, therefore, France could raise more wheat, if her agriculture was more scientific.

France, taken as a whole, produces about eight dollars an acre; England, sixteen. The animal produce of an English farm is equal to the total yield of a French farm of similar size. The value of land in England averages two hundred dollars per acre; in France, it averages only about one hundred. The consumption of animal food in France, including fowls, fish, eggs, and cheese, as well as meat proper, is but one-sixth of a pound daily, or barely one-third of that in England. There is no doubt that the climate requires less animal food in the former country than in the latter; but still this disparity is excessive. Two hundred years ago, the agriculture of France was far more advanced than that of England. During the seventeenth century, the former country constantly exported corn to the latter. But from the time of the great wars of Louis XIV. the agriculture of France has stood comparatively stationary, while that of Great Britain has been improving ever since the close of her civil wars. Unsettled governments, the drain of men for the army, and the impoverishment caused by long wars, have produced the evils in the one case, as their absence has led to this vast material progress in the other.

Louis Napoleon, now apparently seated firmly on his throne, at least for life, may do much to redeem France from this inferiority. He has proclaimed himself the friend of material progress, and, to do him justice, has really stimulated French industry in many directions. It remains to be seen if he will assist, as much as he might, the development of French agriculture. If he can raise the product of wheat, per acre, from thirteen and a half bushels, to twenty-eight, as it is in England, or even to twenty, he will have done more for his country than if he had conquered Moscow, subjugated Turkey, or annexed Naples. The hundred victories of his uncle, the glories of Marengo or Austerlitz, will be as nothing, compared to such a reform in the farming of France.—*Ledger.*

For "The Friend."

Restoration through Suffering and Obedience.

I have read with interest the original matter contained in the "Friend" as well as the selections. The "Extract from the letter to a Friend" in a late number, conveys evidence of a proper spirit with reference to the present condition of the Society, and doubtless was intended to stir up the pure mind to increased putting forth of the powers it may be furnished with, in order to bring about the restoration of harmony among us. It is very desirable to have correct views of its real state, and perhaps it is better to underrate, than to overrate its standing. Much depends however, upon our own feelings in the estimate we form; and if an eminent prophet thought that almost total desolation had overtaken the chosen people, it would be nothing new if many in the present day should feel greatly distressed and be ready to adopt his language, though we can hardly suppose the present state of the church is as low as at that time. "I have been very jealous for the Lord God of hosts;" said he, "because the children of Israel have forsaken thy covenant, thrown down thy altars, and slain thy prophets with the sword; and *I, even I only, am left:* and they seek my life to take it away." In this depressed view, he was directed to anoint a king and a prophet to succeed him, and was then told, "Yet I h left me seven thousand in Israel, all the k which have not bowed unto Baal, and every mo which hath not kissed him." The "Extract," e veys the opinion that the watchmen and watchwor at this day are few, walking solitary and sad, w their eyes bent to the ground, clothed with sa cloth, while leanness and fasting have entered i their souls, and the meal in the barrel and the in the cruse are so nearly exhausted that some h not faith to make use of it for fear it will not be plenished—also the prospect of those coming from among the younger ranks who will arise a build, is so faint, that *all hands* seem feeble and *knees* weak as water. This is a deplorable pict indeed, and there may be ground for it; but i needful to remember that we have an arch enem who would constantly keep before our vision suc representation, for the purpose of destroying hope and faith, both in the unfailing mercy of t blessed Shepherd of his sheep, and in his power a his readiness to manifest it, for the defence and deliverance of his people. Affections of the mind well as of the body are contagious, and as we to wear our sackcloth much out of sight, and wash and anoint that we appear not unto men fast, while those humbling dispensations are very p fitable to prepare us to experience the Lord's streng to be made perfect in our weakness and humiliati it is also needful to do nothing to cause the hea of the Lord's children to faint, or to cast away t shield, as though they had not known the anointi oil to have been poured upon them.

We greatly need humbling under a proper se ing of our entire inability to do the Lord's wo without him, and as a people, to be brought ba to that trust and confidence in Him alone, and n in the sons of men, by which a safe standing up the Rock was experienced by our fathers in t Truth. The tribulations and convulsions of this d are designed to restore us to this faith and tre and upon this foundation; and many are aware of who have been gathered to the place of true pray relying on the Lord alone, and he has come dow for their help, and for the help of the Society, to ri out of its present thraldom. During our two la Yearly Meetings, very many were brought und deep exercise of spirit, and in the latter particular were gathered as in the silence of all flesh, to wat and to wait before the Lord for preservation; a their prayers were put up that He would take h cause into his own hands, and by his invisible pow conduct his church to his honour, and the advanc ment of his cause, and its final redemption out the difficulties into which it has been introduced i a wrong spirit attempting to change our doctrin and weaken our strength to support the testimoni of Truth, which He raised us up to bear. In th exercise, we believe many of our beloved young a middle-aged Friends were heartfelt partakers; the were those among them who trembled for the safe of the ark; and who with their older Friends ha rejoiced that divine kindness secretly restrained th winds and the waves, and gave his faithful childre to participate in a calm during the struggle, a especially at the close. May none of us be pe mitted to fall into indifference, under a temporar suspension of our particular trials; but abiding our tents, where no divination or enchantment fro without or from within can prevail, the Lor seeing our thorough devotion to Him, and to th work and to the suffering which he appoints, w more and more display his goodness in conducti us to victory over the devices of the cruel enemy, a we trust would bring the Society back into th enjoyment of the communion of saints, and the e altation of the pure standard of Truth and righ

less, which the faithful in days of old expe-
ed.
We all hold fast to the doctrines of the gospel,
ir first Friends held them, and very few admit
they have changed in this respect,—sincerely de-
e that we may show forth their excellency by
uits of the Spirit, and that the beauty and glory
s church and spouse of Christ may be seen in
armonious and steadfast walking together in
we need not doubt that the Lord would open
way for our restoration as a Society, wherever
y be located. The disposition to seek after novel-
d a broader way, would be rebuked; a lively
rn would spring up to remove every thing that
ucts the holy harmony which belongs to God's
d and family; many would come to see where
have given way too much to their own wills, in
feelings and their treatment towards one ano-
r, and being humbled before the Lord, they
d be engaged to forego what was wrong, ask-
orgiveness of him, and making way for em-
ng one another in the sweet fellowship, which
th the Father and with the Son, among them
walk in the light as he is in the light, and who,
gh adorable mercy, experience the blood of
s Christ to cleanse them from all sin. The
, we believe, is on the wheel. May the Lord
y it on and perfect it in his way and time, to
ionour of his great name, and the salvation and
cing of his tribulated children.

Israelitish View of the Wars of Christians.

he following anecdote may probably impress
s of the Christian advocates of war more for-
than much direct reasoning, on its unlawfulness
r the Gospel dispensation.
friend lately told me, that some years since,
n he was at Mentz in France, he called at a
ish seminary and proposed leaving a few re-
us books for the pupils. The head of the in-
tion told him he had no objection to the books
g given to the pupils, but that he should think
oper to inform them that Jesus Christ of whom
spoke, was not the real Messiah. On my
nd reasoning a little with him, and pointing out
correspondence between the Old Testament,
ch prophesied of Christ and the New, which
rds the fulfilment of those prophesies, he ac-
wledged there was a remarkable coincidence
veen them. "But," he said, "there was one plain
of that he in whom Christians believed was not
promised Messiah; for the Hebrew Scriptures
told, that when He appeared his followers should
n war no more; but" he asked my friend,
uld he name any nation which had not made
on other Christian nations?"
n relating this, my friend added, "what a stum-
g block do professing Christians thus throw in
way of the Jews." This view of the subject
ms especially the serious consideration of those
o acknowledge that war is incongruous with
religion of Christ, and yet maintain that his
cepts which prohibit defensive as well as of-
ive war are not intended to be obligatory till
second coming. Our Saviour himself says,
e that hath my commandments and keepeth them,
it is that loveth me." This and many similar
larations leave no doubt that he intended his
owers to act on them from the time he delivered
m. Of what avail is the labour of such per-
s in disseminating the Scriptures, &c., if they
ieve that obedience to the precepts of the Gospel
not obligatory at the present time. Is it not
ething like preaching another Gospel than that
ich has been preached? and does not a fighting
ristian imply a disbelief in prophecy,—a denial
Christ as the promised Messiah? W. N.

Religion is the fear of God, and its demonstration good works, and faith is the root of both; for without faith we cannot please God; nor can we fear what we do not believe.

THE FRIEND.

FIFTH MONTH 31, 1856.

The public mind appears to become more and more excited on the subject of slavery and the efforts making and to be made for its extension or repression. The near approach of the presidential selection, has probably much to do with the course pursued by active agents of the two great parties into which the country is likely to be divided, but although much may be done by them to delude and misrepresent in order to rouse popular feeling on one side or the other, it is yet evident that a crisis is rapidly approaching; that multitudes who have heretofore stood aloof from what they regarded as mere political squabbles, are beginning to feel the serious character of the struggle that is going on, and the momentous consequences to our country which must result from it, let the decision be which way it may; and not a few appear to apprehend the horrors of a civil war and the entire disruption of the ties that have heretofore bound the different sections of the country together.

The accounts from Kansas confirm the suspicion expressed some time ago at Washington, that the Executive of the United States, has authorized the employment of officers and troops of the U. States, to put down resistance to the decrees of the pro-slavery legislature; and they are assisting in the arrest of numbers of the free soil party charged with treason on account of their connection with the doings of the Topeka convention. The intelligence is contradictory, and evidently greatly coloured by the excited feelings of those giving or receiving it; but there appears to be little doubt that the armed bands have come into collision, blood been shed, and life lost; while the multitudes of hot blooded men who have been long seeking for an opportunity to carry out their nefarious schemes by brute force,—countenanced and assisted as they are by influential political partizans at a distance—seem likely to be successful in stifling the voice of the opponents of slavery and in obliging them to leave, or to forego their opposition. It is announced that the town of Lawrence has been destroyed, and that the surrender of arms and entire submisssion to the laws of the pro-slavery legislature are required, in order to escape the charge of treason; but we think there is reason to doubt the entire correctness of the report.

This case is one which we think strikingly illustrates the impolicy as well as the antichristian character of all attempts to support or promote a good cause by violence or an appeal to the unsubdued passions and instincts of men. The course pursued by the south in regard to the settlement of Kansas has been overbearing and aggressive, but we think it cannot be denied, had those favourable to freedom who have gone there to reside, and those who have taken an active part in promoting the emigration of that class of settlers, quietly and steadily maintained the principles of peace, instead of resorting to physical force for their defence or to bring about the end desired, that end must have been eventually, and probably more speedily obtained, with much less suffering and humiliation in the interim, than now appears at all likely to be the case, after the resort to Sharp's rifles, the boldest defiance and the sharpest invective. My kingdom, said our Saviour, is not of this world, else would my servants fight; and though he may at times by his almighty power bring good out of evil and cause the wrath of man to praise him, yet the principles of Truth and the fruits of these principles, which all belong to his kingdom, are ever best defended and extended by meekness and gentleness, and are ever obstructed by any thing that stirs up those lusts from whence come all wars and fightings.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to Fifth mo. 10th.

The clipper ship Racer had gone ashore on Arklow Bank, and would probably prove a total wreck. All her passengers and crew, numbering over 500, were saved. The Queen held a Court at Buckingham Palace on the 8th inst. for the purpose of receiving the addresses on the Peace from the House of Lords, the House of Commons, and the city of London. The deputations came in great state, and numbered nearly 100 persons. The Queen briefly acknowledged the addresses, and expressed her satisfaction that peace was re-established on a basis that affords security for its permanence. Both Houses of Parliament had recorded a vote of thanks to the army and navy. A pension of £1000 for life has been settled on General Williams, who has also been created a Baronet, by the title of Sir William F. Williams, of Kars. Lord Colchester gave notice of a motion requiring Parliament to express its disapproval of the policy of abandoning maritime rights so long held, as the Congress at Paris had pledged Great Britain to do. To celebrate the Peace, the Queen has granted an amnesty to all political offenders, and consequently Smith O'Brien, Frost, Jones, and others, may return home. Special exception, however, is made against those who escaped to the United States. The 29th of Fifth month has been fixed as the day of general celebration of the Peace throughout England. A new government loan of £6,000,000 is announced. The Liverpool cotton market was nearly unchanged. Sales of the week, 46,500 bales. New Orleans fair was quoted at 7*d.*; middling, 6 5-16*d.* Western Canal flour, 32*s.*; Philadelphia, Baltimore and Ohio, 35*s.* 6*d.* a 37*s.* 6*d.* The bullion in the Bank of England had increased £83,750. The minimum bank rate of interest was 6 per cent. Consols, 92¾.

FRANCE.—A bill was introduced into the Legislature granting 400,000 francs for the baptism of the Imperial Prince. The Moniteur publishes the monthly account of the Bank of France, and the balance was satisfactory. A son of the King of Sweden, the King of Wurtemburg and Maximilian, brother of the Emperor of Austria, are visiting Louis Napoleon. Count Edgar Ney is to be the bearer of Napoleon's letter in reply to the Czar's notification of his accession to the throne of Russia. Count Morny has been appointed Minister to St. Petersburgh. Count Orloff has taken for him the Woronzoff Palace on a three years' lease. Speculation on the Paris Bourse had reached a great height. The English commercial papers are warning the British capitalists against it. The weather in France for several days previous to the sailing of the steamer, had been very severe.

SPAIN.—The arrest of suspected persons continued at Barcelona. The conscription had passed off quietly throughout the country.

BELGIUM.—A dispatch from Brussels says, "In the Chambers, on Wednesday, the Foreign Minister, in answering an interrogatory in regard to the recent speech of Count Walewski on the press of Belgium, replied, that that speech had not been officially communicated to the government. When that communication should be made, the answer would be read, and would be communicated to all the governments, and would formally maintain the rights of a constitutional and independent country. It was asked further whether any Power had asked for any modification of the laws relating to the press in Belgium. The Minister said he would answer in one word, 'Never.' The meeting broke up amidst immense cheering and enthusiasm."

HOLLAND.—A treaty of Commerce and Navigation based on principles of reciprocity has been concluded between Austria and Holland.

ITALY.—It is stated that a collective note of the Powers that signed the treaty of Peace, is about ready to be sent to the governments of Rome and Naples, recommending certain reforms for the benefit of the Italian people. Questions relative to the Conference, have been put to Count Cavour in the Sardinian Chambers. He replied that pending the negotiations concerning Italy, he could not speak. With respect to the Treaty of Peace, he believed it would insure great moral and material advantages. The Sardinian view of the Italian question

was adopted, while that of Austria was neglected. Hence the question of Italy is and must continue to be a European matter. He added that the relations of Austria and Piedmont had not been ameliorated by anything that has occurred, and that the Sardinian government may rely on the people to meet every emergency.

TURKEY.—Accounts from Constantinople to Fourth mo. 24th, had been received. The scherif of Mecca, having been recalled, refused to give up his post. Fifty thousand Arabs, in arms, sustained his resistance, and are said to have refused to permit the pilgrims to enter the city, under the pretext that the Ottoman Empire is defiled. The Porte was preparing to send troops to abate this rebellion.

UNITED STATES.—*Congress.*—In the Senate, a speech of much ability was delivered recently by Charles Sumner, of Massachusetts, on Kansas affairs, in the course of which he denounced, in strong language, the authors of the Kansas-Nebraska bill and other measures tending to fasten the curse of slavery upon the territory. Some of his remarks were highly personal, assailing the motives of Senators and others. On the 22d, Senator Sumner remained at his desk, writing after the adjournment of the Senate. While thus engaged, Preston S. Brooks, of South Carolina, a member of the House of Representatives, approached him, unobserved, and abruptly addressed him, and, before he had time to reply, gave him a stunning blow upon the head with a cane, and continued the blows until Sumner sank upon the floor, exhausted, unconscious and covered with blood. This brutal outrage was brought before the notice of both Houses the succeeding day, and a committee was appointed in each to inquire into the circumstances attending the assault. Brooks alleges the libellous tenor of Sumner's speech, especially in regard to South Carolina, and Senator Butler, of that State, as having led to the assault. The House has passed a resolution authorizing the Secretary of the Navy to dispatch a vessel with the provisions which may be privately contributed for the relief of the Cape Verde sufferers.

The Dispute with England.—Lord Clarendon's last letter respecting the connection of the British Minister and the Consuls at New York, Philadelphia, &c., with the violations of the U. S. laws, in the enlistment question, is respectful and conciliatory. He declares there never was any intention on the part of Great Britain to insult the United States, or violate its laws, and concludes by a hope that the explanations and assurances now made will be found satisfactory.

Kansas.—In consequence of the attempted arrest of the members of the Free State Legislature and other prominent Free State men, on charges of high treason, a state of fearful excitement has been produced in the territory. The people of Lawrence being well armed, and resistance expected, the U. S. Marshal had issued his proclamation calling upon the citizens to aid him in executing the writs. Despatches from Missouri state that so many men had responded to the proclamation, that the towns of Kickapoo, Leavenworth, Doniphan and Atchison were almost deserted. On the 24th, several despatches were forwarded from St. Louis, but it is impossible to tell how much of their statements is fact, and how much the result of excited partisan feeling. One says, "A gentleman who arrived yesterday from Jefferson City, states that a battle had been fought at Lawrence, in which a number of people had been killed on both sides. No further particulars have been received." Another—"A dispatch from Boonville to the Republican says, that the town of Lawrence was destroyed on Wednesday. The same day the hotel at Kansas City, and the printing-office were destroyed. Particulars of these events are expected by the steamer, whose arrival is looked for to-night." The latest dispatch on that day was as follows—"The Leavenworth correspondent of the St. Louis Democrat says that the Committee of Public Safety of Lawrence have determined to offer no resistance to the U. S. Marshal. An immediate secreting of arms and ammunition took place as soon as this determination became known, and the people commenced evacuating the town. It is said that the Free State men are gathering at Topeka, and will resist the invaders if they attempt to execute their threats against Lawrence." The pro-slavery party have, it would seem, at last brought affairs to a crisis in which civil war can only be avoided by the submission of the Free State men.

Philadelphia.—Mortality last week, 176.

New York.—Mortality last week, 322.

Boston.—On the evening of the 24th, an immense assemblage of the citizens of Boston was held to give expression to their indignation at the assault on Senator Sumner. The Governor of the State presided, assisted by forty Vice Presidents, including the most distinguished men of all parties. The resolutions which were adopted unanimously, are strong and emphatic. One of them expresses their confidence that Congress will free itself from the crime, by expelling the offender from the seat which he has disgraced.

Miscellaneous.—Copper Mining.—The yield of the Lake Superior mines this spring is said to be quite large. It is estimated that the yield of the season will be at least 6000 tons, worth not less than $2,500,000.

Railroads.—The receipts of the railroads in the United States, during the Fourth month, were the largest ever known. On fourteen roads, the receipts of which, in Fourth month, 1855, were $2,749,191, there was an increase last month of $802,725.

An American Legislature.—A New York paper states that of the 149 members of the last Assembly of New York, a large portion of whom were elected as "Know Nothings," there was but one man of the whole, who was of American parentage. Not one of the others was sprung from natives, either on the father's or mother's side. The fathers of 80 were Englishmen, 16 Irish, 12 Scotch, 14 Dutch, 10 Germans, 9 Welsh, 6 French, 1 Swiss. The mothers were of foreign birth in about the same proportions.

Tobacco in Iowa.—The Council Bluffs (Iowa) Chronotype says, that Colonel Reed, of Onondaga county, New York, has purchased a large tract of land in Pottawattamie county, Iowa, for the cultivation of tobacco—in the growth and manufacture of which he has had experience.

American Oaks in Paris.—Out of the one hundred and twenty American oaks, thirty-five years old, which were planted last year on the Quai des Tuilleries in Paris, eighty-seven are now green and flourishing; the rest (thirty-three) are dead.

The Treaty between Brazil and Paraguay establishes the free navigation of the river Paraguay.

A Scientific Commission has been appointed by the Russian Minister of Naval Affairs, for the purpose of laying down a correct chart of the Caspian Sea.

Imports and Exports.—The imports into the United States for the quarter ending Third mo. 31st last, were of the value of 77,582,771; the exports for the same period, (including $6,471,247 in specie,) amounted to $85,031,433.

RECEIPTS.

Received from Wm. Blackburn, Pa., $2, vol. 29; from G. Michener, agt., O., for Jos. Talbott, $2, vol. 28; from Ruth A. Foster, R. I., $2, vol. 28.

WEST-TOWN SCHOOL.

The Committee charged with the oversight of this Institution, will meet at West-Town on Fourth-day, the 4th of next month, at 10 o'clock, A. M.

The Committee on Admissions meet on the same morning, at 8 o'clock, and the Committee on Instruction, on the preceding evening, at half past 7 o'clock.

The Visiting Committee meet there on Seventh-day afternoon, the 31st. THOMAS KIMBER, Clerk.

For the accommodation of the Committee, a conveyance will be at West Chester, on the arrival of the morning and afternoon cars on Third-day, the 3d of Sixth month. The cars start at half past 7 A. M., and 5 P. M.

DIED, at the residence of his son-in-law, Thomas Foster, in Hopkinton, R. I., on the 1st instant, JOHN WILBUR, an approved minister in the Society of Friends, in the 82nd year of his age. He was distinguished through life for integrity and uprightness in all his intercourse with his fellow-men—for the soundness of his judgment, and his usefulness as a counsellor,—not only in his own religious society, but among his neighbours and a large circle of acquaintances without its pale, by whom he was respected and beloved,—and for his adherence to manifested duty through the various trials and vicissitudes of a long and eventful life. He was devotedly attached to the principles and testimonies of our religious society, in their primitive purity, as promulgated to the world by George Fox, and his faithful co-labourers in the cause of Truth—believing that they are neither more nor less than primitive Christianity revived; and he was a faithful watchman against the stratagems of the enemy to introduce innovations upon those pure principles and testimonies, from whatever source, or under whatever pretext they might be introduced. He was firm in his opposition to the errors of Elias Hicks, and faithful in exposing them; and was among the first to discern the approach of the enemy in the opposite direction—often saying that it made little difference on which hand he carried us off, if so be that his work of estrangement from the Truth be effected. Hence his early manifestation of uneasiness with many portions of the writings of J. J. Gurney, and with the outward views of many others in the society, first apparent in England, against wh he was constrained to testify, while there in the ser of Truth; and on his return to his native land, he the like necessity laid upon him to comply with Christian discipline in this particular, warning his fel members against a spirit which would compromise Truth for the sake of outward ease, under the spec pretext of love and charity. His trials on account of faithful support of the ancient doctrines and testimo of the society, it is not the object of this notice to scribe, a faithful account of them having been alre published. But it may be truly said of him, as of scph, anciently, "The archers have sorely grieved h and shot at him, and hated him: but his bow abod strength, and the arms of his hands were made str by the hands of the mighty God of Jacob." Tho firm and uncompromising, he was mild and forbearin evincing no ill will to those who differed from, and w disposed to resort to extreme measures against him. often spoke of having endeavoured to weigh his moti and his acts in this matter, with those whom he o regarded as his friends, in the balance of the sanctu with a desire to be rightly directed in all his moveme saying, that whenever he had looked towards concess the way had seemed covered with darkness, and he l clearly seen that those precious testimonies of Truth, which our worthy predecessors suffered so much with incurring a fearful responsibility, be compromised. B ing endeavoured to serve his Lord and Master, in day and generation, the evening of his life was ser and tranquil. After his return from his last Europ visit, in the spring of 1854, he seemed to regard his bours as nearly finished; speaking of that visit as evening sacrifice, in the offering of which he felt gr peace; and it proved to be the last he made without limits of his own Yearly Meeting, within which he c tinued to labour, to the comfort and edification of friends; often remarking, both in public and in priv that he believed his day's work was nearly done. Es cially was this the case during the last year of his li and on taking leave of a Friend's family, after attend his Monthly Meeting, in the Fourth month last, thou then in usual health, he remarked that he believ he was there for the last time. Thus forewarned prepared, with his lamp trimmed and his light burni he awaited the last remaining conflict, which in mer was made short. On the morning of 28th of Fourth m he was seized with severe pain, which threatened imm diate dissolution. Being aware of this, he said to his dau ter, "If I go now, all will be well." She soon after minded him that he was taken ill much as his moth had been, who survived but about half an hour, added, "I do not wish to alarm thee." He replied, "Thou cannot alarm me." On the day following, fin ing that he continued to fail, she said to him, "father, th art very feeble; dost thou expect to recover?" He plied, "no, I know I shall not, and I do not desire it am ready to go." She said, "then thou hast seen enou of this world?" he replied, "yes, plenty, plenty." S told him she had been looking towards him for comp when her dear husband (then) drew with consumpti should be gone. He replied, "thou must not." Dur the severe paroxysm of bodily distress, which lasted several hours, not a murmur escaped him, nor any tok of impatience. Although active remedies succeeded relieving his pain, yet his constitution had so far giv way that he continued to sink, and subsequently, fr weakness, and what appeared like partial paralysis the organs of speech, articulation was difficult, so th he said comparatively little that could be understoo but what could be understood was indicative of peac fulness and resignation. In reply to a question whether he felt peaceful, he replied, "very." His interest in t welfare of the Society continued unabated to the last, was evinced on the evening before his decease, by i desiring to hear read a letter received, giving some a count of Philadelphia Yearly Meeting; and during its rea ing, he turned his face to the reader and listened attentive intimating that he fully understood it. Late in t evening his son, who lived at a distance, and whom had been expecting, arrived; and, on approaching hi asked him if he knew him; he called him by name, a smiled very pleasantly. His son inquired of him i gard to the state of his mind; he answered that "I was clear before him;" to another he said that he w "very happy," which were nearly the last words uttered. In the latter part of the night he fell into quiet slumber, in which he continued until about eig o'clock on fifth-day morning, the 1st of Fifth mont when he departed hence, without doubt, to an inheritan incorruptible, undefiled, and that fadeth not away.

A SUBSCRIBER.

"have been a man of sorrow and affliction from hildhood, feeling the want of the Lord, and ning after him; separated by him from the nature and spirit of this world, and turned in towards him, almost ever since I could re- er.

n this sense of my low estate, I sought after ord; I read Scriptures; I watched over mine heart; I cried unto the Lord for what I felt ant of; I blessed his name in what he merci- lid for me, and bestowed on me, &c. What- t read in the Scriptures, as the way of God to nderstanding, I gave myself to the faithful ce of; being contented to meet with all the ch, opposition, and several kinds of sufferings, it pleased the Lord to measure out to me ; and I cannot but say, that the Lord was unto me, did visit me, did teach me, did help d testify his acceptance of me many times, to freshing and joy of my heart before him.

ut my soul was not satisfied with what I met hor indeed could be, there being further quick- and pressings in my spirit, after a more full, and satisfactory knowledge; even after the sight and enjoyment of God, as was testified Scriptures to have been felt and enjoyed in rmer times; for I saw plainly, that there was of the streams, and a great falling short of wer, life and glory, which they partook of. d not so the spirit, nor were so in the faith, d so walk and live in God, as they did. They ome to Mount Zion and the heavenly Jeru- &c., which we had hardly so much as the knowledge or apprehension what they were. t I saw the whole course of religion among s, for the most part, but a talk, to what they joyed, possessed and lived in.

his sense made me sick at heart indeed, and upon deep crying to God, close searching scriptures, and waiting on God, that I might the pure sense and understanding of them, nd in the light, and by the help of his Spirit. hat the Lord did bestow on me in that state, hankfulness I remember before him at this lay; for he was then my God, and a pitier watcher over me; though he had not pleased direct me, how to stay my mind upon him and abide with him. And then I was led, (indeed I was led, I did not run of myself,) into a way of separation from the worship of the world, into a gathered society; for this both the Scripture and the Spirit of God in me gave testimony unto; and and what we then met with, and what leadings and help we then felt, there is a remembrance and testimony in my heart to this day. But there was somewhat wanting, and we mistook our way, for whereas we should have pressed forward into the spirit and power, we ran too much outward into letter and form; and though the Lord in many things helped us, yet therein he was against us, and brought darkness, confusion and scattering upon us. I was sorely broken and darkened, and in this darkened state, sometimes lay still for a long season, secretly mourning and crying out to the Lord night and day; sometimes I ran about, hearkening after what might appear or break forth in others, but never met with any thing, whereto there was the least answer in my heart, save in one people, who had a touch of truth; but I never expressed so much to any of them, nor indeed felt them at all able to reach my condition.

"At last, after all my distresses, wanderings, and sore travails, I met with some writings of this people called Quakers, which I cast a slight eye upon and disdained, as falling very short of that wisdom, light, life and power, which I had been longing for and searching after; I had likewise, some pretty distance of time after this, opportunity of meeting with some of them, and divers of them were by the Lord moved, (I know it to be so since,) to come to me: as I remember at the very first they reached to the life of God in me; which life answered their voice, and caused a great love in me to spring to them; but still in my reasonings with them, and disputes alone, in my mind, concerning them, I was very far off from owning them, as so knowing the Lord, or so appearing in his life and power as my condition needed, and as my soul waited for. Yea, the more I conversed with them, the more I seemed in my understanding and reason to get over them, and to trample them under my feet, as a poor, weak, silly, contemptible generation; who had some smatterings of truth in them, and some honest desires towards God, but very far off from the clear and full understanding of his way and will. And this was the effect almost of every discourse with them, they still reached my heart, and I felt them in the secrets of my soul, which caused the love in me always to continue, yea, sometimes to increase towards them; but daily my understanding got more and more over them, and therein I daily more and more despised them.

"After a long time I was invited to hear one of them, (as I had been often, they in tender love pitying me, and feeling my want of that which they possessed,) and there was an answer in my heart, and I went in fear and trembling, with desires to the Most High, who was over all, and knew all, that I might not receive any thing for truth, which was not of him, nor withstand any thing which was of him, but might bow before the appearance of the Lord my God, and none other: and indeed, when I came, I felt the presence and power of the Most High among them: and words of truth, from the spirit of truth, reaching to my heart and conscience, opening my state as in the presence of the Lord Yea, I did not only feel words and demonstrations from without, but I felt the dead quickened, the seed raised, insomuch as my heart, in the certainty of light and clearness of true sense, said, 'This is he, this is he, there is no other; this is he whom I have waited for and sought after from my childhood, who was always near me, and had often begotten life in my heart, but I knew him not distinctly, nor how to receive him, or dwell with him.' And then in this sense in the melting and breakings of my spirit, was I given up to the Lord, to become his, both in waiting for the further revealings of his seed in me, and to serve him in the life and power of his seed.

"Now what I met with after this, in my travails, in my waitings, in my spiritual exercises, is not to be uttered; only in general I may say this, I met with the very strength of hell. The cruel oppressor roared upon me, and made me feel the bitterness of his captivity, while he had any power; yea, the Lord was far from my help, and from the voice of my roaring. I also met with deep subtilties and devices to entangle me in that wisdom, which seemeth able to make wise in the things of God; but indeed is foolishness and a snare to the soul, bringing it back into captivity, where the enemy's gins prevail. And what I met with outwardly from my own dear father, from my kindred, from my servants, from the people and powers of the world, for no other cause but fearing my God, worshipping him as he hath required of me, and bowing to his seed, which is his Son, who is to be worshipped by men and angels for evermore, the Lord my God knoweth, before whom my heart and ways are, who preserved me in love to them, in the midst of all I suffered from them, and doth still so preserve me, blessed be his pure and holy name.

"But some may desire to know what I have at last met with: I answer, 'I have met with the Seed.' Understand that word, and thou wilt be satisfied, and inquire no further. I have met with my God, I have met with my Saviour; and he hath not been present with me without his salvation; but I have felt the healing drop upon my soul from under his wings. I have met with the true knowledge, the knowledge of life, the living knowledge, the knowledge which is life; and this hath had the true virtue in it, which my soul hath rejoiced in, in the presence of the Lord. I have met with the seed's father, and in the seed I have felt him my father; there I have read his nature, his love, his compassions, his tenderness, which have melted, overcome, and changed my heart before him. I have met with the seed's faith, which hath done and doth that which the faith of man can never do. I have met with the true birth, with the birth which is heir of the kingdom, and inherits the kingdom. I have met with the true spirit of prayer and supplication, wherein the Lord is prevailed with, and which draws from him whatever the condition needs, the soul always looking up to him in the will, and in the time and way which is acceptable with him. What shall I say? I have met with the true peace, the true righteousness, the true holiness, the true rest of the soul, the everlasting habitation, which the redeemed dwell in. And I know all these to

be true, in him that is true, and am capable of no doubt, dispute, or reasoning in my mind about them, it abiding there, where it hath received the full assurance and satisfaction. And also I know very well and distinctly in spirit, where the doubts and disputes are, and where the certainty and full assurance is, and in the tender mercy of the Lord am preserved out of the one, and in the other.

"Now, the Lord knows, these things I do not utter in a boasting way, but would rather be speaking of my nothingness, my emptiness, my weakness, my manifold infirmities, which I feel more than ever. The Lord hath broken the man's part in me, and I am a worm and no man before him: I have no strength to do any good or service for him; nay, I cannot watch over or preserve myself: I feel daily that I keep not alive my own soul, but am weaker before men, yea weaker in my spirit, as in myself, than ever I have been. But I cannot but utter to the praise of my God, that I feel his arm stretched out for me; and my weakness which I feel in myself, is not my loss, but advantage, before him. And these things I write, as having no end at all therein of my own, but felt it this morning required of me, and so in submission and subjection to my God, have I given up to do it, leaving the success and service of it with him.

I. PENNINGTON."

Aylesbury, 15th of Third month, 1667.

Judge McLean's Views.

Washington, May 14, 1856.

To the Editors of the National Intelligencer.

Gentlemen:—As the communication of Judge McLean, which appeared in your issue of 22d of December, 1847, is now much looked for and of general public interest, will you not oblige me and many of your readers by republishing it? General Cass has made allusion to it in his speech of the day before yesterday, and hence it is desirable that the public should know what the full scope of the Judge's views are.

[The following is the article alluded to above, of which Mr. Justice McLean is the reputed author; and as he has been referred to as such, both on the floor of Congress and in the public press, without contradiction, we presume there is no impropriety in our permitting him to be named as the writer.—*Editors Nat. Int.*]

From the National Intelligencer, Dec. 22, 1847.

Has Congress Power to Institute Slavery?

The first article of the Constitution declares "that all legislative powers herein granted shall be vested in a Congress of the United States," &c. This limits the legislative action of Congress to the subsequently enumerated powers.

In the eighth section of the first article of the Constitution it is declared that Congress shall have power "to exercise exclusive legislation in all cases whatsoever over such District, not exceeding ten miles square, as may by cession of particular States and the acceptance of Congress become the seat of the Government of the United States; and to exercise like authority over all places purchased, by the consent of the Legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings."

Under this provision the cession of the District of Columbia was made, within which territory slavery had been long sanctioned, so that the power of Congress to institute it within the District did not arise; and no one, it is supposed, would contend that within the cession of a non-slaveholding State for forts, &c., Congress could establish slavery.

In no part of the Constitution are slaves named or referred to as property: they are designated as persons. In the second section of the first article, which apportions representatives and direct taxes, the words "three-fifths of all other persons" include slaves. They are referred to in the ninth section of the same article, which declares that the "migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year eighteen hundred and eight," and also in the second section of the fourth article, in relation to fugitives from labour. In no other part of the Constitution is there any reference to slaves.

In the third section of the fourth article it is declared "that Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States." The power here given is limited to the regulation of the property of the Government, and may be exercised as well within a State as a Territory. It gives no express power to institute a Territorial Government or to adopt regulations beyond the specific objects of the grant. Congress are authorized "to dispose of" the territory (land) or other property. Political power is not, it would seem, within the grant. This is considered too clear to be controverted.

There is no specific power given to Congress in the Constitution which authorizes the establishment of a Territorial Government except that which relates to the District of Columbia.

The Ordinance "for the government of the territory of the United States north-west of the river Ohio," was approved, 7th of August, 1787, which was before the formation of the Constitution of the United States. That Ordinance provided for the first and second grades of Territorial Government, which extended over the territory that includes the present States of Ohio, Indiana, Illinois and Michigan. Separate Territorial Governments were formed under the Ordinance, as the progress of population required. This provided for the government of all the territory ceded to the Union at the adoption of the Constitution; and this fact may have been supposed to render any provision on the subject in the Constitution unnecessary. On the 7th of August, 1789, the Ordinance was modified by an Act of Congress so as to adapt it to the Constitution.

On the 25th February, 1790, North Carolina ceded to the Union territory which now constitutes the State of Tennessee, which was accepted by act of Congress on the 2d of April ensuing. In the act of cession, among other provisions, it was stipulated "that no regulation made or to be made by Congress shall tend to emancipate slaves;" and on the 26th of May, 1790, by the act of Congress, the ordinance of 1787, with certain exceptions in the act of cession, was adopted "for the government of the territory of the United States south of the river Ohio."

The first annexation of foreign territory to the United States was Louisiana, within which slavery existed under the French and Spanish Governments. Florida, which was subsequently annexed, was also a slave territory. Texas was a slave State.

If any part of Mexican territory shall be annexed, as slavery is not sanctioned in Mexico, it must come into the Union as free territory; and the important question arises whether Congress have power to make it slave territory.

No question is better settled in this country than that slavery exists in a State by virtue of the local law; that the power over the subject is exclusively vested in the State; and that Congress, except as to the recapture of slaves, can exercise no pow over it.

The relation of master and slave is depende upon the local law; and when the slave escapes any means to a State where such relation does exist he is free, unless under a general law he m be recaptured by the master. The Constitut which authorizes the reclamation of fugitives fr labour, is the law of the Union on this subje There is no principle in the laws of nations nor the common law, as between sovereignties, wh authorizes a recapture of a fugitive slave. Th principles will not be disputed by any one who l examined the decisions of the courts of the Uni States.

Under the articles of confederation there was provision for the return of fugitives from justi but none in regard to absconding slaves. Th was, therefore, no obligation on a free State, unl imposed by its own law, to deliver up a slave; n was there any legal means through which the m ter could claim the fugitive. The inconvenien and collision which frequently arose from this s of things led to the above provision in the Consti tion.

The power to institute slavery belongs exc sively to the community in which it exists. In language of Chief Justice Taney, (in Groves Slaughter, 15 Peters, 508,) a State "has a ri to decide for itself whether it will or will not adm slaves to be brought within its limits from anot State, either for sale or for any other purpose; a also to prescribe the manner and mode in wh they may be introduced, and to determine wh condition and treatment; and this action cannot controlled by Congress, either by virtue of its po er to regulate commerce, or by virtue of any ot power conferred by the Constitution of the Uni States."

And in the case of Prigg vs. The Commonwea of Pennsylvania, (16 Peters, 611,) the Supre Court says: "The state of slavery is deemed to a mere municipal regulation, founded upon a limited to the range of the Territorial laws:" a "It is manifest from this consideration that, if Constitution had not contained the clause for rec ture, every non-slaveholding State in the Un would have been at liberty to have declared i all runaway slaves coming within its limits, and have given them entire immunity and protect against the claims of their masters.'

The true construction of the Constitution is, t implied powers can only be exercised in carry into effect a specific power. And this implicat is limited to such measures as shall be appropri to the object. This is an admitted and safe rul construction. It is believed to be the only which has been sanctioned by statesmen and juri Powers exercised beyond this are not derived fr the Constitution, but must depend upon an limited discretion. And this is despotism.

Now, there is no specific power in the Consti tion which authorizes the organization of a Te torial Government. Such a power was given relation to the District of Columbia, and it equally necessary in regard to other Territor But, if this power be implied from the specific p er given to regulate the disposition of the pu lands, it must, under the above rule, be limited means suitable to the end in view. If Congress beyond this in the organization of a Territorial vernment, they act without limitation, and establish a monarchy. Admit that they may ganize a Government which shall protect the la purchased, and provide for the administration justice among the settlers, it does by no means low that they may establish slavery. This is a

on which must be created by the local sove-
nty. It is a municipal regulation of limited
nt, and necessarily of an equally limited origin.
s a domestic relation over which the Federal
ernment can exercise no control. And, above
the institution of slavery is not within any im-
lation which can be drawn from the power to
ulate and dispose of the public lands or other
perty of the United States. As before remarked,
es are not treated in the Constitution as property.
y are made property by the local law.
The Supreme Court of the United States have
ded that, under the power to regulate commerce
ong the States, Congress could not interfere with
slave trade between the States. And with how
h greater propriety and force of argument could
a power be sustained than the power to esta-
h slavery in a Territory? In the latter there
othing from which the power can be implied,
e the former is admitted to include all commer-
dealings among the States. And it was upon
ground that in the constitution, slaves were
ted as persons and not as property that they
e held not to come within the commercial pow-
If Congress under any implied power, may in-
te slavery in a Territory of the United States,
much stronger grounds may they exercise the
mercial power over the transfer and sale of
es among the States.
n the Territories of Louisiana and Florida,
gress recognized, and to a limited extent regu-
l slavery. But, as before remarked, slavery
ted in those Territories at the time they were
d to the United States, and in the treaty of
ion of Louisiana the United States bound them-
es to protect the property of the citizens. Slaves
at Territory were considered as property, and
e within the treaty. And it is singular that
fact in the Missouri controversy was not, I be-
e, relied upon by the South. It was the strong-
position that could have been taken on that side
he question.
free territory be admitted, and Congress have
power to institute slavery within it, the territory
t remain free until the people shall form a State
ernment; then the question may arise, in the
cise of this sovereign power, whether slavery
l be admitted.
an the President and Senate by a treaty esta-
h slavery in the new Territory? Such a power
t found in the Constitution nor in the laws of
ons.

Congress and the Territories.

Washington, May 13, 1856.

My Dear Sir:—A friend stated to me yesterday
he understood you to say that I did not con-
r that Congress had power, under the Consti-
n, to prohibit slavery in a Territory. I never
ted that Congress had this power, and I could
r have expressed any doubt on the subject.
ou may recollect that I have, in conversations
you, often said that Congress, having the pow-
establish a Territorial Government, might, in
exercise of a police power, *prohibit* slavery,
ough they had no constitutional power to *insti-*
it.
informed my friend that I was sure he mis-
rehended you. I drop this note that in the
ication of your speech you may correct any
ake of the stenographer on this subject.
Very truly yours, JOHN McLEAN.
Hon. L. Cass.

Washington, May 13, 1856.

My Dear Sir:—I received your note just as I was preparing to resume my speech, and therefore could not answer you then. Your informant is in error. All I said was to present precisely the view I took in 1850.

I have just looked it over, and find I have said nothing of your denial of the power. It refers to your opinion that Congress has no right to control the domestic relations, and introduces a quotation from your article of 1847, in which you deny the power of Congress to introduce slavery into the Territories. If I can get a proof copy of that part of my remarks this afternoon, I will send it to you; but, I repeat it, the views I have presented of the question are little more than a repetition of my views in 1850. I am, dear sir, truly yours,

Hon. John McLean. LEWIS CASS.

Epistle of George Fox.

Great was the rage and enmity of professors, as well as profane, against the truth and people of God at this time; and great the contempt and disdain they showed of Friends' plainness. Wherefore I was moved to write the following, and sent it forth:—

An Epistle to Churches gathered into outward forms, upon the earth:—

All ye churches gathered into outward forms upon the earth, the Son of God is come to reign; he will tread and trample, will shake and make you quiver, you that are found out of his light, without his life and power. His day hath appeared; mortar and clay will you be found. Breaking, shaking, and quaking, are coming among you; your high building is to be laid desolate; your professed liberty shall be your bondage; the mouth of the Lord of hosts hath spoken it. Tremble ye hypocrites, ye notionists! the fenced cities shall be laid desolate, the fruitful fields shall become a wilderness; your false joy shall become your heaviness; the time of weeping and desolation draweth nigh! Come ye witty ones, see how ye can stand before the Almighty, who is now come to plead with you; you will fall like leaves, and wither like weeds! Come you that have boasted of my name saith the Lord, and have gloried in the flesh, ye shall fade like a flower; who have slain my witness, yet boast of my words, which have been as a song unto you. Come ye novelists, who love novelties, changeable suits of apparel, who are in the fashion, outward and inward, putting on one thing this day and another the other day. 'I will strip thee,' saith the Lord, 'I will make thee bare, I will make thee naked, and thou shalt know that I am the Lord. What! hast thou professed the prophet's words? hast thou professed the apostle's words, and my Son's words? hast thou covered thyself with their expressions? thinkest thou not that I see thee out of my life? thinkest thou thou witty one, to hide thyself where none can see thee, thinkest thou, if thou fliest to the uttermost parts of the earth, that I am not there? Is not the earth mine, and the fulness of it, saith the Lord? Come all ye, that have trusted in your own conceited notions, and knowledge and wisdom; who were never yet out of the earth and the lusts of it; never yet got the load of thick clay off you; never were out of the drunken spirit, whose imperfection appears, which must be come upon as a potter's vessel, broken cisterns; ye that have been made wise in your own conceit, wise in your own eyes, in which pride hath lifted you up, and not the humility; you must be abased. You have run on every one after his own invention; every man hath done the thing that was right in his own eyes, that which pleased himself. This hath been the course of people upon earth. Ye have run on without a king, without Christ the light of the world, which hath enlightened every one that is come into the world. But now is truth risen, now are your fruits withering.

And you that are fortified and have fortified your strong houses, called your churches, make ye your cords strong; the Lord will break you asunder, ye that are gathering in and ye that are gathered. For the Lord is risen to scatter you, his witness is risen in the hearts of his people, they will not be fed with dead words nor with that which dies of itself; nor will they be satisfied with the husks which the swine feed upon. All ye priests in the nation, and teachers, that now stand against the light, your envy shows that ye are in Cain's way; your greediness shows that ye are in Balaam's way; your standing against the light which hath enlightened every man that cometh into the world, doth manifest that you are in Korah's way, that spoke the great high words of vanity; ye whose consciences are seared as with a hot iron, whose judgment doth not linger, whose damnation doth not slumber, who serve not the Lord Jesus Christ, but your own bellies; who are the evil beasts spoken of, which have destroyed many families, taken away their cattle, their horses, their goods, even their household goods; destroyed many poor men, even whole families, taking their whole estates from them, whom you do no work for. O! the grievous actions that are done by you, the ministers of unrighteousness; whose fruits declare to the whole nation that you are the devil's messengers! your actions declare it; your taking tithes, augmentations, treble damages, midsummer dues, (as ye call them,) of them ye do no work for, nor minister to.

All ye powers of the earth, beware of holding such up as are unrighteous. Let not the words of the unrighteous overcome you, lest God, the righteous judge of heaven and earth, take hold upon you; whose judgment is according to that of God in you, which will let you see when you transgress. Come you proud and lofty ones, who have not considered the handy works of the Lord, but have destroyed them; nor have regarded the way of the Lord, but have had plenty of the creatures, and have therewith fattened yourselves, and forgotten the Lord and his way; O let shame cover your faces here upon earth! Come ye that are given to pleasures, and spend your time in sports and idleness and fulness; your fruits declare the sins of Sodom; yet you will talk of my name, and of my saints' words. But I behold you afar off, saith the Lord; you are proud and lofty, you are evil patterns, bad examples, full, rich and idle; who say others are idle, that cannot maintain your lusts. O! the unrighteous balances, that are among people! O! the iniquity, in measuring! O! the oppression in ruling and governing. Because of these things, my hand shall come upon you, saith the Lord. For the oppression is entered into the ears of the Lord, who gives rest to the wearied, to the burthened, to the oppressed; who feeds the hungry, and clothes the naked; who brings the mighty from their seats, beats the lofty to the ground, and makes the haughty bend.

Come, saith the Lord, ye mockers, scorners, and rebellious ones, light and wild people, vain and heady; you have had your day of joy, you have scoffed, you have mocked and derided my messengers and my ambassadors, who have preached in your streets and cried in your synagogues and temples; a day of trembling and lamentation shall come upon you when you are not aware; I will take away your pride, and your height; I will shake you as a leaf, and bring you to be as men distracted. I will distract you, and make you that you shall not trust one another, in the earth, who have joined hand in hand against my servants, in the truth. I will smite you with terrors and bring fear upon you;

the cup of my indignation and fury shall you drink. Where will you appear when repentance is hid from your eyes, when profane Esau, your father, is set before you, and Ishmael and Cain, wild and envious, whose fruits declare the stock?

Come ye proud priests who have eaten up the fat of the nation, who by violence have taken other men's goods, whose envy hath slain many, whose wickedness and darkness hath abounded, and whose unrighteousnes daily appears; your fruits every day declare it, in summoning up by writs and subpœnas from most parts of the nation, for wages and tithes, such as you do no work for. O abominable unrighteousness! how is the state of man lost; that they do not take these things to heart, to feel them? What havoc is made in most parts of the nation with such; and all ye priests and teachers who are railing and brawling in the pulpit, setting people at variance one against another, haters and hateful, provoking people to hate one another, here is the seed of enmity seen which you have sown and are sowing, whose seed must be bruised by the seed of the woman, which above your heads is set.

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 300.)

HENRY WILLIS.

Henry Willis was born at Westbury, Wiltshire, in Old England, on the 14th of the Seventh month, 1628. We find no account of the character of his parents, nor what religious restraints he was subjected to in youth; but he himself in early manhood had evidently submitted to the cross of Christ. In 1654, he married Mary Pease, a religious young woman, and they both were soon convinced of the Truth as professed by the people called Quakers. In 1660, Henry Willis, going to Salisbury prison to visit some of his fellow professors, who were confined there for their christian testimonies, was arrested and carried before the mayor of that town. He was charged with no breach of the laws, but the oath of allegiance was tendered to him, and as he could not swear for conscience' sake, he was committed to prison.

In the year 1670, he removed with his family to America, and purchasing a body of land on Long Island, he called it Westbury, after the name of the place of his nativity. But persecution was not confined to England, as Henry Willis and his fellow professors on Long Island, found. About the beginning of the year 1680, Henry Willis and John Bowne had each of them a daughter married according to Friends' order. They were probably Henry's eldest daughter Mary, and John's daughter Elizabeth. Magistrates and priests were all displeased at the manner of those marriages, inasmuch as they received no fees. This caused them to bring Henry and John before a court of sessions, who fined them each £10. They could not conscientiously pay the fines, and so suffered distraints, as the following petition from them sets forth:—

To the Governor and his Council at New York.

The address of Henry Willis and John Bowne concerning the proceedings of a court of sessions against us, who said they fined us £10 apiece, for suffering our daughters to marry contrary to their law. This proceeding, we are satisfied, is without precedent, and we count it no less, but either a mistake or hasty oversight. Though we have endeavoured for its removal, yet execution is issued forth, and Joseph Lee, under-sheriff, hath seized Henry Willis' barn of corn, and since hath taken from John Bowne five good milch cows, driving them away by night, and keeping them pounded from food, most of two nights and a day and part of a day, so that the neighbours were generally troubled at it. Now, in simplicity we do entreat all that may be concerned herein, seriously to consider it, and in coolness of spirit, without anger or hard thoughts, truly to weigh it in the balance of equity, where the witness of God may arise in every conscience to testify, whether if such things should go on and be proceeded in, it would not be the ruinating of families, and to the kindling of God's anger against the place or people. This we truly desire may be prevented, by taking away the occasion. Wherefore we make our address to the chief in authority, knowing that the magistrate's authority is to preserve men's persons and estates, but the prerogative of the conscience belongs to God, and we dare not but yield obedience thereunto, as God hath persuaded our hearts, and we do not act, as sometimes resented, in stubbornness, obstinacy, or contempt of authority; but in simplicity, having God's fear in our hearts that we may keep our consciences clear before him, from whom we receive strength to uphold us in trials and exercises. We earnestly desire the Lord may persuade your hearts, that ye may remove the cause of this our address, and open that eye in you that can see us as we are, who can pray for those in authority, that under them we may live a peaceable, holy and godlike life.

HENRY WILLIS,
JOHN BOWNE.

4th of Seventh month, 1680.

We know not whether the fine in the case was remitted or not, but we know that Henry Willis continued to suffer for his testimonies against war, and against hireling ministry. The distraints made on his property for his not training, induced him to address the governor and council, Twelfth month 24th, 1686. The last instance of pecuniary suffering inflicted on him by the magistrates, which I have met with, was a fine of £4 10s. in 1687, for not contributing towards a dwelling-house for the priest.

Henry Willis, pretty early in his religious life, came forth as a minister. We find him in the year 1681, at the first Yearly Meeting held at Burlington, in company with his friend and fellow sufferer, John Bowne. They were appointed by that Yearly Meeting, to request of the Friends on Long Island, that the members of Shrewsbury meeting might in future belong to Burlington Yearly Meeting. He and J. Bowne appear to have generally attended the Yearly Meeting at Burlington and Philadelphia, in the early day. They both signed in 1692 the testimony of the meeting of ministers against George Keith.

About the end of 1699, Henry Willis felt a concern to remove to Philadelphia. His eight children were all grown up, and principally settled, so that it appears he brought none of them with him. His daughter Elizabeth, however, in 1696, had married William Rakestraw, and resided in Philadelphia.* The certificate granted by Flushing Monthly Meeting for him and his wife Mary, is dated Third mo. 26th, 1700. It certifies of him as "our ancient and dear Friend," and says he had "constantly sought the honour of God and his truth."

Henry Willis was growing in years, yet he appears to have been much dedicated in visiting neighbouring meetings, and was employed in the business of the Monthly Meeting. In 1702, he paid a religious visit to the eastward, his comp being for "Long Island, Rhode Island and N England." How far he went, we do not know, he reported on his return, that "the Yearly Me ing on Long Island was large and well," and t he "had a meeting at Woodbridge, at which w several newly convinced Friends from Staten land." In the Third month, 1704, he obtained consent of his friends to attend once more Yearly Meeting at Long Island. The record his visits to meetings within a few miles of Phi delphia, continue abundant through every year til 1708. Early in that year, he requested a tificate for himself and wife, intending to remove reside with their daughter at Newtown, West Jers Before the close of the year, they had removed fr Newtown, it is believed, to Long Island, where an their children and children's children, they mi find comfortable and loving attention, during few days of their earthly pilgrimage yet allot them.

Here, our trace of this industrious minister of gospel and labourer in the Lord's earthly harv field ends. The period of his release from earthly service was probably not long delayed. was over 80 years of age, when he last changed place of abode. If, in the hour of death, he the testimony of the Lord's Holy Spirit, beari witness in accordance with the declaration of friends, that he had constantly sought the hono of God and his truth, to the end, he needed nothi more. This was sufficient to sweeten every bit cup, even the final parting with his long united a tenderly beloved Mary.

* Elizabeth lived but a few years after her marriage.

The following letter of Samuel Jennings w mislaid when the biographical sketch of him w published, and therefore necessarily omitted.

James River in Virginia,
30th of Eleventh mo., 1693-4

Dear Friend,—Being prevented seeing you ag before my voyage according to my expectati when I parted with you, I had not opportunity take leave in that solemn manner as was and my love to you in the truth inclined me t and though I have written privately to several, thereby am I not clear, feeling my love in the u versal truth to flow to all the faithful, in whi [love] I greet you with this epistle, desiring as own your preservation, growth and increase in t truth, to the glory of him that hath called you, a the consolation of you, his called and chosen one

Dear Friends, I have no new thing to write u you, but in brotherly love to remind you of th ancient Rock of our salvation, which the God, compassion hath revealed to us in these latter da that we, through building upon it, might partake that rest which his own in all ages possess Dear Friends, I am persuaded and satisfied c cerning many of you, who have waded throu many tribulations that here you are fixed, and sh never be removed. For the Most High is yo defence, who will suffer none to pluck you out his hand. Oh Friends, the covenant of God w his people is sure and everlasting. I have words fitly to express his love to his redeeme Have we love to our own offspring? How mu more he to his royal offspring! As the heav are higher than the earth, and as God is grea than men, so does his love excel that of the best the children of men. Friends, as I have borne share of exercise with you, so cannot I forget yo and this is in my heart to say to you; I believe storm is near at an end. Therefore, keep to yo Rock, and you shall never be removed. Neith let the things that have happened among you, se

ige. Many before now have risen up to draw gathered of the Lord from their guide and y; but their end has been confusion, so shall with all that are found in that way, and persist ein. Let all that love truth and the unity of y, amen.

ear Friends, Stand your ground, and give no to the adversary. As for those that have de- ied from us, if ever we are united, they must e to us, we cannot go to them. As we are kept e love and wisdom of Truth, we shall know to demean ourselves towards them; having passion on some, making a difference; for all not alike in the transgression. For such as o not wholly lost their integrity, I hope for their rn; which, if they do, I cannot see how they be clear in the sight of God and men, but by fying against their outgoing. Dear Friends, d in your dominion and authority in the Truth inst all backsliders and revolters, without re- rt of person, and judge for God in righteousness. shall nothing be spared, but what God will re. For where the cause is his, it is not in our er to exercise forbearance, under the pretence tenderness and charity, where God will have rment executed. Those that appear most back- d under this pretence of judging and condemn- the guilty, I have observed most forward in demning the innocent. He that justifies the ked, and he that condemns the righteous, are an abomination to the Lord. So, dear Friends, ng desirous to be remembered by you before the rd at the throne of grace, that I may be pre- ed, if the will of God so be, to see you again, enjoy in the fellowship and communion of life, ke my solemn leave of you, and rest your friend brother, SA. JENNINGS.

or Friends in Pennsylvania and Jersey.

(To be continued.)

Commercial Integrity.—There is a wide scope the inspired truth, that "righteousness exalteth ation." Whether understood in the broad sense t national prosperity is dependent, under God, the measure of living piety, or in the more re- cted meaning of uprightness of character and hling as the true foundation of private and pub- weal, the principle is a vital one, and it em- dies the great secret of honourable success for in- iduals and communities.

We have special need, as a people, to study and ply this principle. As a commercial nation, with internal traffic as varied and extensive as the ersified products and wants of twenty-five mil- ns of people, and external connections reaching nearly every port and tribe of the wide world, inspired lessons of commercial integrity ought be familiar to our merchants and tradesmen, and the young men who are in training for those nourable occupations. It should be inscribed on e door of every counting-room, and blaze from e pages of every ledger. "*Better is a little with ighteousness, than great revenues without right.*" *Honesty is the best policy.*"

The temptations to swerve from the path of strict titude in business affairs are many and great in country presenting so many avenues to enterprise, d with such multiplied instances of rapid accu- ulation by speculative action. But "he that aketh haste to be rich shall not be innocent," and, dinarily, will fail of success; or his very success ll prove his ruin. The intoxication of wealth is real and perilous as that of the bottle; and there e few who can withstand the temptations to pride, varice, and even dishonesty, which come in the ain of sudden affluence.

There are recent and most painful illustrations of the law of Providence that ill-gotten gains are a curse to their possessor; and most impressive beacons for the youth of our country who are entering on a commercial career. An accomplished man, of good family, and high standing in political circles, yielded to the temptation of avarice, perpetrated a series of frauds which drove him from his country in disgrace, and recently he died at an obscure tavern in England. Another, who had won a name and place in the commercial world which gave him a controlling influence in the wealthiest corporations, grasped the bait of corruption, became the outcast of society, and died in a foreign land.

Only a year ago, the literature of the country was contaminated by an autobiography suited to undermine the principles of the young, and to lure them from the career of plodding honesty into the paths of trickery and deception, made attractive by the apparently brilliant success of the author. A widespread feeling of sadness and alarm pervaded the ranks of Bible-loving, fair-dealing men, lest such an example should fill the land with reckless adventurers in business, and swell the list of bankrupts in morals. But wait a little, and see whether false principles are safe. The reported *millionaire* is announced in the secular papers as a bankrupt. "They that will be rich, fall into temptation, and a snare," and "pierce themselves through with many sorrows."

Such suggestions as the following would secure a race of business men who would honour the land that furnishes them so noble a theatre for successful enterprise:

1. Engage in no business inconsistent with the strictest morality—none in which you cannot daily seek the blessing of the Most High.

2. Follow your chosen vocation—and that alone—whatever temptations to speculation or rapid acquisition may present themselves.

3. Adopt no "tricks of trade," however sanctioned by custom, that involve deception or untruthfulness.

4. Never incur a debt beyond your resources.

5. Always live within your means.

6. Devote a fixed portion of your income beforehand, to charitable uses, to be employed and accounted for as systematically as family expenditures.

The man who will regulate his business by such simple rules as these, may free himself from the feverish excitements of adventurous traffickers, and assure himself, with God's blessing, of an honest competence, if not of a beneficent affluence. Such principles make the character of the Amos Lawrences and the Samuel Budgetts of the business world, and secure for a people honoured by their example, a good name among the nations.

For "The Friend."

William Dewsbury.

(Continued from page 302.)

Having experienced the efficacy of the one saving baptism, William Dewsbury began to feel about the year 1646 a strong engagement of mind, to declare to others what the Lord had done for his soul, and was freely given up to proceed at once, as the Lord should order him in the work of the ministry. It, however, appears clear that he had not then received the necessary commission, which was to be communicated in due time. For, as he was revolving the subject in his thoughts, it is a circumstance, no less remarkable than some which have been already related, that he was commanded to stay until the year 1652. This impression was attended by a prophetic intimation, that at that time there would be more hungering and thirsting raised in the hearts of people after the Lord, than was then the case. In the obedience of faith, following these directions, the nature of which he had by this time learned, he continued for some years in the pursuit of his trade. He held religious meetings in his own house, and in the neighbourhood where he lived, until the appointed time arrived; but it does not appear from information which has come down to us, that he was in the vocal exercise of any gift, either at the said meetings or elsewhere. While in this state of suspense, and before he was known to George Fox, he was deeply proved for the trial of his faith, which he had received of the Lord Jesus. "In that day and hour of temptation, I witnessed," says he, "these Scriptures fulfilled in me. I found a law in my members, warring against the law of my mind, so that when I would do good, evil was present; the sense of which caused me to cry, 'Oh wretched man that I am! who shall deliver me from the body of this death?" And as I was crying to the Lord, to free me from the burden I groaned under, the word of the Lord came to me, saying, 'My grace is sufficient for thee; I will deliver thee.' And by the power of this word, I was armed with patience to wait in his counsel; groaning under the body of sin in the day and hour of temptation, until it pleased the Lord to manifest his power to free me, which was in the year 1651. Thus, through the righteous law of the Spirit of life in Christ Jesus, I was and am made free from the body of sin and death; and through these great tribulations, my garments are washed and made white in the blood of the Lamb, who hath led me into the New Jerusalem, where nothing enters that works abomination, or makes a lie, but that which is written in the Lamb's book of life. Here my soul now feeds upon the tree of life, which I had so long hungered and thirsted after, that stands in the midst of the paradise of God. Here, there is no more curse nor night; but the Lord God and the Lamb are my light and life forever and ever. And I witness that I am regenerated and born again of the immortal Seed, and having partaken of the first resurrection, over such the second death hath no power."

The reader may now form a judgment, both as to his views of Christian doctrine and the religious experience, with which William Dewsbury afterwards entered upon the important and arduous services of a minister of the gospel. It is evident that his fitness for such an office, depended not on education or artificial attainments, on the peculiar bent of his mind or the force of his genius, but on the preparation the whole man had undergone for the reception of the gift; while he lay as clay upon the wheel of the great Potter. Having, in that condition, fully known the utter impossibility of attaining to peace with his Creator, so as to enjoy communion with him, without the mediation of a Saviour, who, as advocate with the Father, could plead his own most precious blood, as the price paid for the ransom of souls, and impressed with the high importance of obtaining the possession of the good things thus provided, which are variously set forth in the Holy Scriptures, and in testimony to the real enjoyment of which they afford so great a cloud of witnesses; he was indefatigable in the pursuit of this one great object. Christ! Christ! was the incessant cry in the secret of his soul! Christ, the bread of life, the fountain of living waters! It was not enough for him to be told, even in the language of Holy Writ, that Christ was his Saviour and Redeemer—that he had tasted death for every man—that he is the propitiation for the sins of all—that he was manifested to take away our sins—and that he had actually borne our sins in his own body on the tree; he could see there was no inheritance of the promise for the first birth, that corrupt nature which attaches to Adam and all his child-

ren in the fall, under which he groaned, and out of which he saw that Christ, the Deliverer, came to redeem us, and to set us free. In consistency with this view, and the doctrine preached by our Lord himself, that "unless a man be born again, he cannot see the kingdom of God," he could not rest short of the sensible evidence in himself, that this work of regeneration was brought about, and making progress in his soul. He was prepared, and constrained to bear witness that none can become partakers of the benefits of Christ's death, but as they are leavened into a measure of his life, which takes place in the obedient mind, according to the testimony of John; "If we walk *in the light* as he is in the light, we have fellowship one with another, and the blood of Jesus Christ his Son cleanseth us from all sin."

Sometime after William Dewsbury had entered into the army, he heard of a young woman of York, who, like himself, had suffered greatly from sorrow and distress concerning the state of her immortal soul; so much so, that, as he was given to understand, she was ready to despair of the Lord's mercy. After due deliberation, it having arisen in his heart to pay her a visit, he concluded to do so, and went. In the course of conversation, they came to understand each other's spiritual condition, which proved to be very similar, they having passed through the like exercises, so that they found themselves nearly united in mind and judgment, "as in water, face answereth to face." They parted. The narrative goes on to state that some time after this, William Dewsbury married, but does not inform us, whether she was the object of his choice. But as the circumstances are related so closely in connection with each other, and the marriage took place at York, we may with some safety conclude in the affirmative. The union was accomplished at a meeting of the Anabaptists, with whom the young woman was associated in religious profession. It is related to have been a season of divine regard; their children, who are the historians in this instance, having often heard their father say, that the hearts of those who attended the ceremony, were so overcome by a sense of the divine presence, that there were but few dry eyes in the room.

A circumstance which immediately followed this interesting event, and which proved a close trial to his faith, seems to show that when he took this important step, his outward means were not affluent. His wife appears to have held considerable property in land, of which she was deprived by her brother. Although everything is said to have been clear respecting the proceedings, and the case was submitted to trial, yet the decision was against him—the judge would not let him have the property. As he was going home, he met with the buffetings of the enemy, who insinuated into his mind some misgivings for having married a well-bred woman, whom he was now likely to bring to poverty. In humiliation and lowliness of mind before the Lord, without yielding to the tempter, he desired the Lord to make him content to be what he would have him to be; and in a moment he was so filled with the divine presence, that he was not able to bear the glory that was upon him; and he desired the Lord, if he had any service for him to do, to withdraw, or he could not live; and he heard as it were a voice, informing him that he would provide for him and those dependant on him, according as he should see best. It was in the year 1651, that William Dewsbury and George Fox first met, early after George's release from Derby prison where he had been confined a year. Passing through the adjacent counties where he had numerous meetings, William and his wife attended one of them at Balby, held in the evening, where they heard George declare the truth. Being moonlight, after the meeting closed, George walked out into the field, and joining him, they acknowledged the doctrine he had delivered, showing their preparation of mind to unite with him in his christian principles and testimony. Sewel informs us that "he was one of those who had already been *immediately* convinced, as George Fox himself was; who, coming to him, found himself in unity with him." A pure gospel ministry, proceeding from the immediate openings of the Holy Spirit, is a great blessing to the church, as dependance is placed and maintained, by the preacher and the hearers, upon the Bishop of souls. When a minister is made the medium of conveying spiritual nourishment, the sincere in heart will perceive the savour of divine life in it, and draw encouragement from it. But where it is the mere product of man's efforts, like a dry wind from the wilderness, the living members will have a sense of it, and it causes sorrow of heart. Even those of the outward court distinguish it from that which comes from Christ's putting forth, for instead of wounding the transgressor, it saves that alive which the Lord would lay in the dust, and leaves them in a profession, at ease without the cross or true self-denial.

(To be continued.)

For "The Friend."

"Stand still and see the salvation of the Lord," was the language of Moses when in a great strait, or time of imminent danger; and by so doing, he and all his brethren experienced a remarkable deliverance. We find in all ages of the world, when the dependent children of the Lord have steadily looked to him for help, they have found protection and deliverance; but if they became weary and sought some other way than the way he pointed out, the tribulated path of the cross, they have always brought upon themselves weakness or death, as did Israel when they became weary of waiting for Moses to come from the mount, and desired gods to be made, to go before them. Oh dear Friends, is there not great danger of our looking too much for some outward way of deliverance from the trials and difficulties the Society is now in, instead of standing still and seeing his salvation. But let it be our daily engagement to "enter in to the closet and shut the door" against all outward or disturbing things, and in the silence of all flesh beseech the Lord to "create in us a clean heart," and to spare his people, and give not his heritage to reproach. It is a time in which the enemy of our soul's peace seems to be taking every advantage of our weakness and revolt, even to transforming himself into an angel of light to deceive, if it were possible, the very elect—trying to cast down, and trying to build up,—persuading some to think more highly of themselves than they ought to think, and inducing some not to be willing to stand for the faith as professed by Friends, and for the discipline of the Society; tempting them to believe that we are in such a disjointed condition it cannot be carried out, &c.

Believe him not, for we are told that he is a liar, and was so from the beginning. Oh that we may look inward to Him that teacheth as never man taught; and no doubt if he is obeyed and trusted in, he will divide the waters as he did for Israel of old, and put a new song in our mouths, even the song of praise to his holy name for deliverance.

Morgan County, Ohio.

Selected for "The Friend."

A christian life should be a practical invitation to holiness. True religion will show its influence in every part of our conduct; it is like the sap of a living tree, which penetrates the most distant boughs.

If the spring put forth no blossoms, in summ there will be no beauty, and in autumn no fr so if youth be trifled away without improvem ripe years will be contemptible, and old age m rable.

Modesty always sits gracefully upon youth covers a multitude of faults, and doubles the lu of every virtue which it seems to hide; the pert tions of men being like those flowers which app more beautiful when their leaves are a little c tracted and folded up, than when they are full blo and display themselves, without any reserve, view.

Graceful in youth is the tear of sympathy a the heart that melts at the tale of woe. Let ease and indulgence contract your affections wrap you up in selfish enjoyment. Accustom yo selves to think of the distress of human life, of solitary cottage, the dying parent, and the weepi orphan.

Submit your minds to early impressions of re erence for sacred things. Let no wantonness of yout ful spirits, no compliance with the intemperate mir of others, ever betray you into profane sallies; i sides the guilt which is thereby incurred, nothi gives a more odious appearance of petulance a presumption to youth than the affectation of trea ing religion with levity; instead of being an eviden of superior understanding, it discovers a feeble a shallow mind, which, vain of the first smatterin of knowledge, presumes to make light of what th best of mankind revere.

In order to render youselves amiable in societ correct every appearance of harshness in behavio Let that courtesy distinguish your demeanour whi springs not so much from studied politeness, as fro a mild and gentle heart.

Young persons should, above all things, beware of beginnings, and *by no means parley with temp tations*; their greatest security is in flight, and i the study to avoid all occasions of evil; for th cockatrice, which may be easily crushed in the eg if suffered to hatch and grow up, will prove a deadl serpent, hard to be destroyed.

In all thy ways acknowledge the Lord and h shall direct thy steps.

Fourth mo., 1856.

The Fire Alarm and Police Telegraph.—Lo Children.—We saw lately, on the bulletin boar of one of our newspaper offices, an advertisemen of a lost child, which had been posted there as th most public place to attract the attention of person passing. The individual who placed it there pro bably had not noticed that there was a telegraph line extending throughout the city, designed for po lice purposes, and that one of its uses is, or ough to be, to recover lost children, which may be don with a thousand times less trouble, by its instrumen tality, and with much greater celerity. The station in the various parts of the city are all in connectio with the Central or the Mayor's Office. A child wandering from its home, and unable to find its way back, may be taken in charge by a police office and conveyed to the police station of the ward i which it is found. Word may be instantly sent t the Central Office of the fact. The parent, by calling at this office, may immediately have his fear relieved by ascertaining, at once, the safety an whereabouts of the child, and take the necessary steps to repossess it. This is an improvement tha is calculated to save a great amount of anxiety, o trouble and of expense to parents when their chil dren wander from their homes. In this respect th telegraph operates as a great labour-saving machine averting the trouble and expense of searching the city for days for the desired information. It makes

entral Police Station an intelligence office of
most extended character, where individuals
go with the certainty that any information
ts usually comes under police recognition is
o be obtained.

It as convenient as this arrangement may be,
mly one of the uses to which the fire alarm
olice telegraph may be used. Extending its
cations to every part of the city, it, in con-
on with the police force, renders the head of
department almost ubiquitous in all municipal
rs that require his attention. Seated in his
l office, he learns that at one extremity of the
burglary has been committed; at another,
valuable property has been stolen. His orders
stantly transmitted for the detection of the
rs; the stolen property is recovered before the
s have time to get out of the city. The entire
force on duty may all be aroused to vigilance
moment, and the whole city be put instantly un-
surveillance for the detection of crime. It in
greatly multiplies the police force, without the
of maintaining a larger number of officers in the
e, for it makes every man's labour available
the period and place where it is needed. In
of popular commotion it will be found the
preventive of riots, those expensive pastimes
h some of our population used periodically to
lge themselves with, but which, for the good
t of our city, have now grown obsolete. Mur-
will have to be more secret to escape detection.
ional security will be greater; property be bet-
protected. Whatever tends to make detection
certain, tends to lessen the opportunities and
nations to commit crimes. As a preventive
ell as a detective of crime, it combines some of
most serviceable qualities needed in a well ar-
ed and reliable police system, and properly
aged in intelligent hands, its valuable aid will
be felt and acknowledged in the management
operations of the most important and respon-
branches of the municipal government.—*Led-*

THE FRIEND.

SIXTH MONTH 7, 1856.

We are aware that any subject however important
itself or generally interesting to the community,
y be brought forward too often or dwelt upon
long; and we are ready to apprehend that the
sent condition of the slavery controversy oc-
ies so large a share of public discussion and com-
nt, that our readers may think it hardly worth
ile to introduce any thing further respecting it
o our columns at the present time; but the sub-
has now assumed such an aspect that it behoves
ry one having at heart the honour, peace, and
liare of our country, to be acquainted with the
ding facts of the case, and the principles which
e at issue.

It was to be expected that such an abandonment
plighted faith and such disregard of the first
nciples of justice and equity as were involved in
e repeal of the "Missouri compromise," would
oner or later give rise to other outrages on public
d private rights as they might be deemed ne-
ssary in order to carry out the pre-determined
rpose of fastening slavery on the wide extended
ritory heretofore dedicated by the nation to free-
m; but it could hardly have been anticipated that
thin so short a time as has elapsed since the con-
mmation of that iniquitous measure and the pre-
nt juncture, the sentiments and feelings supposed
prevail throughout the non-slaveholding States,
would have been so ruthlessly shocked or set at
naught by a succession of acts such as would dis-
grace the most absolute despotism now swayed over
the most unenlightened of professed civilized nations.
It would seem as though the slavery extension party
calculated upon the stunning effect of their first blow,
having deprived the great body of the nation, of
sensibility sufficient to comprehend or resist the
further deeds of violence by which they are deter-
terminedly striving to destroy all opposition to their
schemes; and are indefatigably labouring to se-
cure their success before public indignation may be
so aroused as to thwart or prevent them.

It is well known, and indeed admitted by the
pro-slavery party, that at the election authorized by
the act of Congress constituting the territorial
government of Kansas, that territory was invaded
by armed bands of Missourians, openly summoned
and guided by noted pro-slavery leaders, who in
most of the districts either seized the ballot boxes
or drove the officers of the election and the rightful
voters from the polls, and receiving the votes of
those only who were favourable to their usurpation,
returned a body of men as legislators, prepared to
take such measures and pass such laws as might be
thought adapted to fasten slavery irrevocably upon
the virgin soil of Kansas.

As evidence of the spirit by which this body of
men were actuated, and the thoroughness with which
they essayed to perfect their work, we give the
three last sections of the act passed by them respect-
ing slaves and slavery. The act contains thirteen
sections. The three first enjoin the penalty of *death*
on any person convicted of raising rebellion or in-
surrection among slaves, free coloured persons or mu-
lattoes; or of assisting, or furnishing arms for such
rebellion or insurrection; or of inducing slaves to
rebel, to conspire against, or murder any citizen of
the territory, by speaking, writing, publishing or
circulating any book, magazine or pamphlet for the
purpose of exciting insurrection or rebellion; while
the 4th, 5th, and 6th sections award the *same pen-
alty*, or imprisonment at hard labour for ten years,
for enticing, decoying, or carrying away any slave
out of the Territory for the purpose of depriving the
owner of such slave of his services, *or to procure
the freedom of such slave;* for *aiding* or *assisting*
in so enticing, &c., any slave out of the territory,
for the same purpose; for enticing &c., any slave
away out of any other state or territory of the
United States for the same purpose and bringing
such slave into Kansas. The three last sections are
as follows:

Section 11. If any person print, write, introduce into, publish or circulate, or cause to be brought into, printed, written, published or circulated, or shall knowingly aid or assist in bringing into, printing, publishing or circulating within this territory any book, paper, pamphlet, magazine, handbill or circular containing any statements, arguments, opinions, sentiment, doctrine, advice or inuendo, calculated to produce a disorderly, dangerous or rebellious disaffection among the slaves in this territory, or to induce such slaves to escape from the service of their masters, or to resist their authority, he shall be guilty of felony, and be punished by imprisonment and hard labour for a term not less than five years.

Section 12. If any free person, by speaking or by writing, assert or maintain that persons have not the right to hold slaves in this territory, or shall introduce into this territory, print, publish, write, circulate, or cause to be introduced into this territory, written, printed, published or circulated in this territory, any book, paper, magazine, pamphlet or circular containing any denial of the right of persons to hold slaves in this territory, such person shall be deemed guilty of felony, and punished by imprisonment at hard labour for a term of not less than two years.

Section 13. No person who is conscientiously opposed to holding slaves, or who does not admit the right to hold slaves in this territory, shall sit as a juror on the trial of any prosecution for any violation of any of the sections of this act.

It will be seen that the last section cuts off all hope of impartial justice being administered in any case having reference to slavery, and by it the value of trial by jury is destroyed. Liberty of conscience, and freedom of speech or of the press are completely sacrificed, and a man may be brought before twelve persons whose only qualification as jurors is their avowed approbation of slavery, who may subject him to five years imprisonment for uttering what they may please to consider an *inuendo* against their favourite institution, and calculated to produce a disorderly disaffection.

Having passed laws so contrary to the first princi-
ples of free government, and in violation of the con-
stitution of the United States, the legislators well
knew that if the people were allowed the right to
select their own officers, it would be impossible to
obtain those who would execute these laws, this body
therefore usurped the right themselves of appointing
all the functionaries, and selected such men as were
supposed to be fit tools for carrying out their decrees.

These high-handed infractions of right and law,
were resorted to because it had been ascertained,
that a large majority of the actual settlers in Kan-
sas, were opposed to the introduction of slavery
within its borders; and it was not to be supposed
entertaining the views and feelings these did, that
they would tamely submit to be thus subjugated,
and deprived of the rights which they had ever be-
lieved inseparable from citizenship in the United
States. They refused to recognise the legislature
which had been elected by Missourians, and to submit
to be governed by a series of laws that were re-
pugnant to the constitution of the United States. It
was resolved to elect delegates to a convention
which should draft a constitution for Kansas as a
State, to be submitted to the inhabitants, and if ap-
proved, that application should be made to Con-
gress to be admitted into the Union. The delegates
elected accordingly assembled in convention at
Topeka, and framed a constitution which being sub-
mitted to the people was approved by a large por-
tion of them, and the necessary officers chosen.

It would have been well had they taken no other
measures of resistance or for righting their griev-
ances, but relying on the justice of their cause, have
patiently suffered for it, and waited until correct
information had been spread throughout the country,
and Congress been called on to investigate the pro-
ceedings and apply a remedy that would meet the
case. But it was resolved to resist oppression by
violence, and thus wrong has so far triumphed and
the cause of freedom been seriously jeopardized.

In the meantime the President at Washington
had recognized the legislature as legally constituted,
and all the laws enacted by it as binding; remov-
ing one governor and appointing another, and also
judges of the courts, all of whom would be likely
to join in with and support the pro-slavery party.
The constitution adopted by the majority of settlers,
was presented to Congress, and a formal application
made for admission as a free State. In the House
of Representatives a resolution was adopted to ap-
point a Committee to proceed to Kansas and in-
vestigate the facts in regard to the election of the
legislature and the invasion from Missouri, and the
committee thus appointed proceeded there to dis-
charge their arduous and dangerous duty.

It is believed to be with the hope of preventing
the effect likely to be produced on the public mind
by the revelations made through this committee,
that some of the officers appointed by the pro-sla-
very legislature resolved to arrest certain individ-
uals, who had been conspicuous in the convention
held at Topeka, with the expectation that resistance
to their proceedings, would bring on a collision be-
tween the two parties, and afford an opportunity to

call in the aid of the General Government, to brand the opposition with a charge of treason, and thus crush all hope of freeing the territory from the yoke placed upon it. So far their plan, (if plan it was,) appears to have been successful, and the angry passions so deeply stirred, and the blood already shed, and the work of destruction begun, seem to forebode the still more dreadful consequences of a more general civil war.

It behoves all those who have living faith in the superintending care and overruling power of an Almighty Creator and Governor of the universe, to strive, while engaged in the performance of their duty as citizens of this great Republic, so to walk before him, that all they do may be performed in his holy fear; so that his ear may be open to hear their prayers to stay the threatened scourge, to restrain the wrath of ungodly men, and cause the principles of his gospel of peace and good will, to triumph over the selfish lusts and unrighteous designs of those who ignorantly or knowingly are promoting the cause of injustice and oppression.

SUMMARY OF EVENTS.

EUROPE.—News from England to Fifth mo. 17th.

Parliament was not in session. The weather in England was more genial, but the crops were backward. At a meeting of the Treasury, the Chancellor of the Exchequer stated that the proposed loan of £5,000,000 was calculated to cover the whole service of the year, except two millions, for which he should propose to issue Exchequer bonds. The playing of the military bands in the London Parks on the first day of the week, has been stopped, greatly to the dissatisfaction of a portion of the populace. Russia is reported to have demanded explanations respecting the secret treaty signed jointly by France, Great Britain and Austria, guaranteeing the independence of Turkey. The Russian government views this proceeding as evidence of a want of confidence in the good faith of Russia. The French Emperor, it is said, has protested against any such inference being made from the treaty. Nearly half a million of Australian gold had arrived within the week. Consols had advanced to 93¾.

Liverpool Markets.—Cotton was in limited demand, and prices had slightly declined. The supply of breadstuffs was large, numerous vessels having arrived laden with flour, wheat, and corn from the United States, Chili, Spain, the Mediterranean and India. Flour was from 32*s.* to 37*s.* per bbl.; wheat, from 9*s.* 6*d.* to 11*s.* per 70 lbs.

DENMARK.—The relations with the United States remain for the present unaltered, and there is no new feature to report in the negotiations. Russia, Sweden, and Oldenburg, have signed a protocol agreeing to adopt the last proposition of Denmark for the capitalization of the Sound Dues, provided all other States interested do the same.

RUSSIA.—It is stated from Warsaw, that the war against Circassia is to be renewed this summer. General Chruleff will have the command of the expedition, under the superior direction of General Mouravieff. The coronation of the Emperor is to take place at Moscow, in the Eighth month.

TURKEY.—The Constantinople papers of the 5th ult. publish the text of the treaty of peace, preceded by a manifesto of the Sultan, expressing his warm satisfaction at the conduct of his own subjects, without distinction or exception. The Turkish government was taking energetic measures, in order to repress the fanatical outbreaks in the provinces. The redif or militia had been dismissed to their homes.

FRANCE.—The non-appointment of a Russian Ambassador at Paris creates some surprise. Eleven thousand of the troops from the Crimea had arrived at Marseilles in three days. The corn market at Marseilles had risen in consequence of unfavourable accounts of the crops in Algeria. The wheat had suffered much from continued rains. The Moniteur has published a decree reducing to 100,000 the number of conscripts of the class of 1856, which, by a bill recently adopted by the legislative body, had been fixed at 140,000, to be called out in 1857. The secret societies were closely watched by the government. Arrests have taken place at Marseilles, and military precautions are observed in several of the large cities.

BELGIUM.—The "Times" Paris correspondent writes, with respect to the Belgian press question, that communications have passed between the French and Belgian Governments which are pronounced satisfactory. Belgium will take more active measures to prevent the publications of appeals to assassination, but without infringing the liberty of the press; and France will take an early opportunity of expressing itself satisfied.

MALTA.—A mutiny had broken out on the part of the foreign legion, composed of Italians and others. The mutineers had entrenched themselves in the Quarantine Fort, but the Governor had moved two regiments and some artillery to the heights that command the fort, to compel the mutineers to lay down their arms. It was supposed they would soon be reduced to submission, as they were in want of provisions.

PERSIA.—A commercial treaty has been negotiated with the United States, by which the latter obtains some important privileges. An English account says, that the treaty was concluded under the auspices of the Russian mission, and its spirit is directed against England.

CENTRAL AMERICA.—The Costa Rican army has evacuated the Nicaraguan territory, retreating by land across the boundary. They shipped 300 wounded men at San Juan del Sur. At the battle of Rivas, they suffered a loss of 200 killed and 400 wounded. The prevalence of cholera in their army is assigned as the reason of the retreat. A brig with ammunition for Walker's army had arrived at Greytown, but the British ship Eurydice would not allow the cargo to be landed.

UNITED STATES.—*The Dispute with England.*—A message from the President, in relation to the Central American question, has been sent to the Senate. It appears there has been no direct communication between the two governments on the main subject, since the Tenth mo. last. On the 24th of Fifth month, Secretary Marcy addressed a letter to the American Minister, G. M. Dallas, in which, after again presenting some of the American views of the matter, he says, "You are instructed, therefore, to enter into a communication with her Majesty's principal Secretary of Foreign Affairs, in relation to Central America, in order to ascertain in the first place, whether existing differences cannot be promptly terminated by a direct negotiation, and if it cannot, then to discuss the conditions of arbitration of those points of difference, as to which alone this method of settlement seems requisite or applicable; it being assumed that the other points of difference would after that yield as of course to a conference between the Earl of Clarendon and yourself, conducted in a spirit of cordiality and frankness." Crampton, the British Minister at Washington, has officially informed of the discontinuance of his official relations with the Minister to the United States, and his passports furnished him. The Consuls at Cincinnati, New York, and Philadelphia, have also been notified by letter of the revocation of their exequators. The reasons for this proceeding are stated in a long despatch from the Secretary of State to G. M. Dallas, under date of the 27th. Of the dismissed officials, it is said, "this course had been deemed necessary on account of their unfitness for the positions they hold, arising from the very active part they have taken in getting up and carrying out a system of recruiting which has been attended with numerous infractions of our laws, which has disturbed our internal tranquillity, and endangered our peaceful relations to a nation with which this government is most anxious to maintain cordial friendship and intimate commercial and social intercourse." The kind and conciliatory spirit of the last note from the British Government is duly acknowledged, and the declarations contained in it, are admitted to remove the ground of complaint as respects that government. The tone of the whole communication, which is a reply to Lord Clarendon's note, is respectful and pacific.

Congress.—The Senate Committee in the case of the Sumner outrage, reported as their conclusion, that, although the assault was a violation of the privileges of the Senate, it is not within their jurisdiction, and the offence can only be punished by the House, of which Brooks is a member. At the recommendation of the Committee, the Senate adopted a resolution making complaint to the House of Representatives. The report of the House Committee recommends the expulsion of Brooks for his unmanly and disgraceful conduct; it also censures Keitt and Edmonson, members of the House, for their connection with the affair. The minority of the Committee prepared a report contending, there had been no breach of the privilege of the House, which therefore had no jurisdiction in the case. Senator Wilson, of Massachusetts, having spoken in the Senate of the attack upon his colleague as brutal and cowardly, was in consequence challenged by Brooks. The challenge was declined, Wilson asserting that he used the language complained of, because he at the time believed, and now believes, it was strictly true and demanded by the character of the assault upon Sumner. Strange as it may seem, this bold outrage is justified at the South, and several large meetings have been held, at wh resolutions were adopted approving the conduct of assailant. Senator Sumner has been dangerously ill consequence of his injuries. A petition has been p sented to Congress from 75,000 citizens of Californ asking the construction of a wagon road, from so point on the western boundary of Missouri to Californ by way of Salt Lake. In the House, the Committee Territories have reported a bill for the admission Kansas, with the Topeka (free State) Constitution.

Kansas.—The violence at Lawrence is thus describ by a pro-slavery paper in that Territory. "We h just arrived from that notorious abolition hole, Lawren On Wednesday evening, the 21st, about 800 men, wa the direction of the United States Marshal, assem before the town, and demanded that the arms in La rence be given up, and he be allowed to arrest those whom he had writs. They submitted to the demand, a unconditionally surrendered, giving up four pieces cannon and some twenty Sharps' rifles. Before t Marshal dismissed the men, Sheriff Jones, though b ness of the plot of the cowardly traitors, in the dar ness of the night, appeared on the hill, and summon the whole company to assist him in making arrests a carrying out his orders. The whole affair was done w *order and according to law.* The Sheriff made abo twenty arrests, and the Grand Jury of Douglas coun having declared the Fort or Big Rock Hotel and the t printing presses nuisances, the sheriff was legally boun to destroy them. Thirty cannon shots were fired at t hotel, breaking it in many places, and then it was burne up. The two presses were totally destroyed. The were two or three abolitionists killed. Two Southe men are dangerously wounded by accident. After th Southern men left Lawrence, the house belonging to th vile traitor Robinson, was burnt, we have been told. This was contrary to orders, and meets with the con demnation of all the Southern men." Accounts from th Free State party say that all the women and childre had been sent away, previous to the entrance of th Marshal's posse, and that no resistance was attempted b the men remaining in the place. Every house was bro ken open under pretence of searching for arms, and be sides much destruction of property, the pro-slavery me who were mostly Missourians, indulged in a general sack and pillage of the town. A detachment of U. S. troop was subsequently stationed in Lawrence. A despatch of the 30th from St. Louis states, "A letter to the Re publican, from Independence, dated the 26th, says tha eight pro-slavery settlers of Pottawotamie Creek were killed by a party of Free State men. The report say the deed was committed by an organized band, who were determined to wreak their vengeance upon the opponents of their views. The other settlers on the creek had asked Gov. Shannon for aid to protect themselves and their property. All was quiet at Lawrence, Lecompton and Franklin. U. S. troops are stationed at each place. Dr Root and Mr. Mitchell, of New Haven, were murdered by a posse, ten miles from Lawreuce." The reported murder of eight pro-slavery settlers by Free State men, is probably untrue, and has been set afloat, with other alleged crimes, of the same party, to justify the reign of terror, which has been established by the aid of the people of Missouri, and under which it is expected Kansas may be made a Slave State.

California.—Dates from San Francisco to Fifth month 5th, have been received. The supply and shipment of gold continues nearly uniform. In the railroad disaster on the Isthmus, 43 persons were killed, and 60 wounded. In Mariposa county, Cal., the Americans had murdered twenty Mexicans and Chilians, the pretext being that an American had been killed by the Chilians. The Americans had ordered all the Chinese, Mexicans, Peruvians and Chilians out of the country. Accounts from Washington Territory state that the Indians have been defeated several times.

Utah.—The Constitution of the State of Deseret was ratified by the people in a Convention held at Salt Lake City, on the 6th of Fourth mo. It is exceedingly brief, and contains nothing about slavery. It announces free toleration to all religions. A memorial was adopted, asking admission into the Union, and two delegates were appointed to present it to Congress.

Philadelphia.—Mortality last week, 175.

New York.—Mortality last week, 287, which is the smallest number in any week for three years past.

MARRIED, at Friends' Meeting at Sadsbury, Lancaster county, on the 17th of Fourth month last, JOSEPH B. COOPER and EDITH P., daughter of Trueman and Juliana Cooper.

From the Annual Monitor for 1856.

Ann Dixon, of Staindrop.

DIED, TWELFTH MONTH, 2ND, 1854; AGED 64 YEARS.

This dear friend was the widow of Ralph Dixon, Staindrop, a memoir of whom appeared in the nual Monitor for last year. She was deprived paternal care when very young, and her mother rudently uniting herself in marriage to a ser- nt of the 31st regiment of foot, brought upon self and children many trials and privations. e soldiers' wives and families accompanied the iment in its various marches in England, Scot- d, and Ireland, and also when it joined the army Holland. The extreme sufferings of the British liers during their campaign in that country, are nutely described by Daniel Wheeler in his jour- . They were also with the regiment at Gibraltar, the island of Minorca, and other parts of the diterranean. Her step father was a very intem- ate man, and mostly consumed his pay in in- icating liquors, leaving his poor wife and children provide for themselves by working for the officers men. On the return of the regiment a second e to Ireland, she became acquainted with Ralph con, and was united to him in marriage. Through she seems to have been mercifully preserved by a d Providence. Her husband, referring to his rriage in the memoranda he has left behind, and aking of his wife, says, "She was a prudent and ustrious young woman, and a better wife than I erved, or had any reason to expect." They had long been married before the regiment sailed from Cove of Cork, for actual service in Spain and rtugal, and landed at Lisbon. She accompanied husband during many a weary march in that d, but the soldier's wives being found a great in- ubrance, they returned to Lisbon, and were all t back in a transport vessel to England. This sel being sadly overcrowded, and without either tor or medicine on board, many died during the sage. Our dear friend did not escape from a ge share of both bodily and mental suffering dur- this voyage, yet she was permitted to reach her ive land in safety, and joined her mother at wes, on the Isle of Wight, where she remained the return of her wounded husband.

Ann Dixon never had the privilege of being at ool; by a little assistance from her mother she s enabled to read the Scriptures, and acquired art of writing from her husband, after they had led down at Staindrop, his native village. Her tural abilities were good, and her judgment sound, notwithstanding the deficiency in her education. The many hardships and great deliverances they had experienced, gave both to the mind of herself and husband a serious turn, and through the pious influence of his mother and brother who were Methodists, they were induced to attend the meetings of that body and afterwards to unite with them in church fellowship. She continued a member of the Wesleyan society for some time after her husband left it. He, knowing the integrity of her heart, did all in his power to give her every opportunity not only of attending their preachings, but also the class and prayer meetings. Although she felt much love to her mother and brother in-law, and many other worthy Methodists, yet she became so dissatisfied with their forms and modes of worship, that she could no longer continue united with them, but resigned her membership and attended with her husband the meetings of Friends. These meetings were mostly held in silence, yet she expressed herself as closely united in spirit to the living members with whom she was now associated. Her husband took great delight in reading to her the history of the society, the journals, and other writings of Friends. When he was engaged in his shop, as her older children grew up around her, it was her practice to assemble them in the evenings, and to encourage them to read in their turns serious books, particularly memoirs of deceased young persons, endeavouring to impress upon their young minds the uncertainty of life, and the necessity of preparation for the solemn change, whenever it might overtake them. The earnestness of these appeals, and the precious feelings which accompanied them, remain fresh in the remembrance of her oldest surviving children. Several of her beloved offspring were cut down in the vigour of youth. She bowed under these chastenings with christian resignation, feeling assured that, through adorable mercy, they had a bright and blessed hope of a glorious immortality.

The poverty and sufferings of her early life, quickened her sympathies for her poor and afflicted neighbours, and she seldom left her own house unless bent on errands of mercy; and assisted by her husband, she often had the satisfaction of relieving the wants and soothing the sufferings of those around her.

She was naturally of a hasty temper, by giving way to which she was often brought under condemnation, but Divine grace eventually triumphed over all, and she became meek and gentle as a lamb.

To adapt her expenditures to her husband's pecuniary circumstances was her great anxiety. In order that they might keep within their small income she wrought with her own hands, and used the greatest frugality in every department of her domestic arrangements.

For several years before her death she suffered from paroxysms of asthma, which prevented her sleeping in the early part of the night; during these long waking hours when all were at rest but herself, she felt her chief consolation in perusing the sacred page. She loved especially to read the book of Psalms,—the penitential, trustful, and joyous language of the Shepherd King, was doubtless often applicable to her own condition, and produced in her mind those devotional feelings which she wished above all to cherish.

A ministering Friend from a distance in a family visit, having been brought into a feeling of her condition, gave her great comfort. She often dwelt on the encouraging language of the Psalmist which he had revived, "Yea, though I walk through the valley of the shadow of death, I will fear no evil for thou art with me; thy rod and thy staff they comfort me."

She felt the loss of her beloved husband, keenly, and though for sometime after, rather better than usual, she seemed impressed with the belief that she should soon follow him, and in all her engagements kept this in view. In the latter end of Eleventh month, she took a cold, which so much aggravated her old complaint, that it was evident she could not long survive the shock. Her son, from a distance, had been sent for to see his sister, who was suffering from severe indisposition. On his arrival he was pleased to find her better; but sorry to observe his dear mother in extreme suffering. She told him that she felt her end very near, and that it was herself whom he had come to see for the last time. She afterward informed her children how she had endeavoured to act up to what she saw to be right according to her small measure; although in many things she felt she had come far short, yet she believed that, through the mercy of God in Christ Jesus her Saviour, her sins were blotted out, reviving the language of the prophet,—"Though your sins be as scarlet, they shall be as white as snow; though they be red like crimson, they shall be as wool." She requested her son who was sitting with her, to read a psalm; at the language, "This poor man cried and the Lord heard him, and saved him out of all his troubles. The angel of the Lord encampeth round about them that fear him, and delivereth them," she could no longer restrain her feelings, but exclaimed, "How true! what consolation."

One of her children asking forgiveness for any unkindness she might have shown towards her, she replied, "How can I expect to be forgiven, if I do not forgive."

The evening before she died, her breathing became extremely laborious, and it was evident to her mournful children, that she was fast sinking. Her invalid daughter was now carried in to see her. She took little notice of her when she first entered; on being asked if she knew her, she replied, "O yes, I know thee." To her inquiry if she felt happy, she said, "I do, I am going to glory." Upon her daughter's comforting her with the assurance that she would soon join her dear father in heaven, she grasped her hand and replied, "Happy in glory! may we all meet there! farewell! farewell." A messenger had been sent for her youngest son, and she inquired once or twice if he had arrived. About nine o'clock she again bid her sorrowing family farewell. The name of Jesus was distinctly heard flowing in soft whispers from her parched lips. About ten o'clock her spirit seemed to have passed beyond the border land. She mentioned distinctly the names of her two deceased daughters and daughter-in-law. "I see them," she said, "in heaven; they are waiting for me." Shortly after, "I see them all," mean-

ing no doubt her dear husband and those that had gone before her. Prayer was now raised that her Saviour would be graciously pleased to be with her in passing through the valley of the shadow of death, and land her safely on Jordan's banks. About eleven o'clock, her purified spirit quitted its tenement of clay, it is consolingly believed for the bosom of her Saviour, to join those beloved ones in heaven, and to unite with them in songs of endless praise.

Paris Correspondence.

Paris, May 15th.

Among the most remarkable of the numerous dissertations to which the present high price of food in France has given rise, is a paper drawn up by Dr. Londe, member of the Imperial Academy of Medicine of this city. Dr. Londe enters upon his subject by laying it down as a fundamental principle in the philosophy of diet, that the use of fresh meat, daily, is necessary to the health of the working classes, although he admits that persons leading a comparatively idle life may do very well on fish, poultry, and other lighter forms of nourishment.

In support of his opinion that a liberal supply of meat is indispensable to the vigour of the labourer, he cites the experience (frequently cited on the same subject) of an English company that established some iron works at Charenton, in the neighbourhood of this city, in 1825. The labour required in carrying on these works called for an outlay of physical strength to which the French labourers were utterly unequal, and it was found necessary to discharge them all, and to bring over a band of English labourers in their place. At length it occurred to the manager that the comparative want of strength of the French workmen might very possibly proceed from the insufficiency of the diet habitual among the working population of this country. He therefore made arrangements for supplying a certain number of them with the same rations of fresh meat as were allowed to the English workmen. Six months after this change of diet, the nimble little Frenchmen were perfectly able to replace their heavier built English rivals.

In 1841, the Rouen Railway Company having conceded the making of their line to English engineers, the latter brought over a band of English labourers, who performed one-third more work daily than could be got out of the French labourers. The latter were put upon a meat diet, similar to that of the English workmen, and in a short time, were able to accomplish the same amount of labour.

The superior strength of the negroes of Louisiana and Georgia, who eat meat once or twice a day, over the same class in the West Indies, who eat little or none, is cited by Dr. Londe as an additional proof of the physical strength resulting from the use of a certain proportion of meat in the human diet. Having thus demonstrated the importance of this aliment, and shown that, in France, as in Belgium, the supply of meat is altogether inadequate, in point of quantity, to the necessities of the population, while its price is so high as to place it beyond the reach of the working-classes, Dr. Londe proceeds to examine the various methods which have been proposed with a view to remedying these inconveniences, viz: the development of the grazing interest in France, the importation of foreign cattle, and the importation of salted meats.

Having passed these methods in review, the Doctor concludes, 1st, that the increase of the grazing department, though of the highest importance to the future prosperity of the country, is too slow a process to suffice for the supply of so imminent and pressing a need; 2d, that the cost attendant on the importation of foreign cattle precludes the possibility of any considerable reduction in the price of meat being effected in this manner; and, 3d, that the habitual use of salted meat is prejudicial to health. He therefore, urges, as the only means of procuring promptly, and at low cost, the supply of meat required to bring the consumption of this important article of food to a level with the needs of the population, the importation, from America, Australia and Russia, of large quantities of meat carefully prepared and preserved in the manner so successfully practised by the Company of Conservation in Algeria, by which means all the markets of Europe might be supplied with an abundance of the finest and most healthy meat, as fresh and succulent as when first slaughtered, and at a vastly lower figure than could be afforded by the French grazier or importer.

Dr. Londe, who was one of some thirty individuals—chemists, physicians, butchers and cooks—invited by the Society of Conservation to be present on the 13th of last January, at the opening of a quantity of their preserved meats, prepared several months before at Constantine, Tangiers, and other points of Algeria, declares that the legs of mutton, joints of beef, &c., opened by him and his colleagues, on this occasion, and examined, cooked and eaten by them on the spot, were precisely similar, in point of appearance, texture, odour, and taste, to the same meat when brought fresh from the butchers.

The process of preserving, as practised by the society in question, is exceedingly simple.

The animal having been killed and cut up as usual, the bones and tendons are taken out from the various joints; the meat, thus prepared, is carried to the preserving room, where a brick furnace, heated by coal, is surmounted by a vast boiler full of water at boiling point. In this boiler stands an earthen vessel full of gelatine, which is kept, by the action of the boiling water in which it is placed, at a temperature of 80 degrees Reaumer. Each piece of meat, attached to a wire, is plunged into the gelatine, and left in it for the space of six minutes, when it is withdrawn, and immediately hung by the wire to the rafters of a great drying shed, contiguous to the kitchen. After hanging here for two days, to dry, the pieces of meat thus coated with gelatine are taken down and plunged for a few seconds into a solution of tannin, (about 20 grains to a gallon of water,) and are then hung up again as before. At the end of from 20 to 25 days, the gelatine is dry, and the joints thus "enrobed" are ready for storage or for transportation.

The packing of meat thus prepared requires care; for, should it be exposed to friction against a rough surface, nails, or anything capable of tearing the coating of gelatine in which each piece is enrobed, the access thus afforded to the air would cause the meat to spoil in the course of a few days. In order to avoid this danger, the director of the company has ordered the meat thus prepared to be packed between thick layers of two small species of rushes, (the *varec* and the *alpha*,) indigenous to the country; which rushes, not only guarantee the pieces of meat most effectually against friction, but furnish a cheap and excellent stuffing for under mattresses, on their arrival in France.

Dr. Londe states that he opened a mutton chop, enrobed at Grenelle, near Paris, on the first of February, 1855, in presence of Professor Paggiale, and sent to him by that distinguished chemist. This chop, opened and cooked March 24th, 1856, by the learned Doctor, was found to be, in all respects, as savory, succulent and nutritious as freshly killed meat. "It is to be observed," remarks Dr. Londe, "that the gelatinous envelope of this chop had not undergone the slightest abras or alteration. The same fact is to be obser with regard to a leg of mutton and several ot pieces of mutton and beef which I have had ha ing for upwards of a year in a room in my hou where a fire is kept up every day, and which, examined a short time ago by myself, in compa with M. Figuier, of the *Presse*, proved to be in state of the most perfect preservation. The succ of the new method of preparation, therefore, pears to us complete; and it only remains to multi establishments of conservation on those points of globe where meat is obtainable at a low price, order to secure an abundant supply of this article food for consumption in those where it is deficie And such an enterprise, though set on foot up a purely industrial basis, and with a view mere to the realization of pecuniary profit for its founde would be none the less a most important agent ameliorating the physical and social condition the labouring classes, which constitute so large portion of the human family."

The certainty of profit resulting from such speculation, might render this simple and effectu method of turning to account the superabunda animal riches of the New World, not unworthy the attention of enterprising capitalists on your s of the water.

The recent discovery by M. Lalement, a dent of this city, of a method of rendering gelatine once elastic and unputrescible by melting with its own weight of glycerine, and boiling the mixtu in a vessel placed in a boiler full of water until t air is entirely expelled, will probably be found as ful in the preparation of meat, as just describe the putrescibility of the gelatine—itself entirely animal substance—having excited some doubt as its adaptability to this mode of conservation.

The curious substance produced by M. Lalemo being poured into moulds, or formed into cak upon a marble slab, is well adapted for printi and galvonoplastic purposes; also for the produ tion of statuettes and other objects in relief; f the preservation of the natural teeth, employed b dentists, which are apt to become brittle when pr served in spirits of wine, bran, or linseed mea also for the manufacture of artificial anatomic preparations, imitating exactly the colour and elas ticity of the various muscles, tendons, &c., of th human body.—*North American*.

Epistle of George Fox.

My dear Friends,—In the power of the everlas ing God, which comprehends the power of dar ness and all temptation, and that which comes o of it, in this power of God dwell. It will bring an keep you to the Word in the beginning; it wi keep you up to the life, to feed thereupon, in whic you are over the power of darkness, and in whic you will find and feel dominion and life. And th will let you see, before the tempter was, and ove him; and into that the tempter cannot come; fo the power and truth he is out of. Therefore, i that life dwell, in which you will know dominio and let your faith be in the power, and over th weakness and temptations, and look not at them but in the light and power of God, look at th Lord's strength, which will be made perfect in you weakest state. In all temptations look at the grac of God to bring you salvation, which is your teach er to teach you; for when you look or hearken t the temptations, you go from your teacher, th grace of God, and so are darkened in going fro that teacher, the grace of God, which is sufficien in all temptations to lead out of them, and to kee over them.

1655. G. F.

A Natural Barometer.—They have in Germany a small green frog, termed by them the "leaf frog," which, when caught, is placed in a glass jar partly filled with water, and steps erected on which the little chap sits. If the weather is to be clear and dry, he reclines on the upper step; but if a storm is approaching he goes down part way, and if the storm is to be a severe one, he goes to the bottom. It is seldom more than an inch or an inch and a half long, and his rations consist of one fly per day.

For "The Friend."

It is pleasing to meet with evidences of what the influence of religion will effect, in those whose means of providing for their dependent children are small, by leading them to the industrious application of their powers which they possess to fulfil their parental duties. From the biography of Mary Lyon, an instructress in several seminaries in New England, we take the brief account which she gave of her beloved mother, and her management of the little farm after her father's death. It brings to mind the character of the virtuous woman, whose "price is far above rubies." "Strength and honour are her clothing, and she shall rejoice in time to come. She openeth her mouth with wisdom, and in her tongue is the law of kindness. She looketh well to the ways of her household, and eateth not the bread of idleness. Her children arise and call her blessed; her husband also and he praiseth her."

The parents resided in Buckland, Mass., and, though in comfortable circumstances, were not among the rich of this world. With industry and economy, they were enabled to meet all the *necessary* wants of their rising family. A small farm, that yields a competence to such a family when tilled by a judicious father, and its avails managed by a frugal mother, will, when divided, give but a small portion to each of the children. On the death of their father, in 1802, at the age of forty-five, they were left to depend mostly on their own exertions. To this loved and rock-bound farm was for a while to be put together, by the superintendence and frugality of the mother, the only son being then but thirteen years of age. Let us learn their situation from Mary's own words, written in 1843. After speaking of a want of correspondence between the dress and contributions of a widow and her daughter, who were supported by the widow's needle, she says, "I was strongly reminded by contrast of another widow, whom I knew and loved forty years ago, and of her 'mountain home.' She was not rich in the treasures of earth. Her little farm was surely not more to her, in providing for her *seven*, than is that skilful needle in providing for the *one*. What want, at that 'mountain home,' was made to walk so fairly and so gracefully within that circle of limited means, that there was always room enough and *to spare* for a more restricted neighbour. I can now see that loved widow, just as I did in the days of my childhood. She is less than forty years of age, and her complexion is as fair and her forehead as noble and lofty as on her bridal day. Now, she is in that sweet garden which needs only to be seen to be loved. Now, she is surveying the work of the hired man and her young son on that wild mountain farm; made one would think, more to assist the soul than to feed the body. But almost always she was to be found busy, both early and late, amid her household cares, and in the culture of the olive plants around her table. In that domain, nothing was left to take its own way. Every thing was made to yield to her faithful and diligent hand. There was no mistake of that good hearted neighbour, who came in one day, begging the privilege of setting a plant of rare virtue in a corner of her garden, because, as he said, it would never die. The roses and the pinks, and the peonies, those old fashioned flowers, which keep time with Old Hundred, could no where grow so fresh and so sweet as in that little garden. No where else have I ever seen wild strawberries in such profusion and richness as were gathered near by. Never were rare-ripes so large and so yellow, and never were peaches so delicious and so fair, as grew on the trees of that favoured farm. The apples, too, contrived to ripen before all others, so as to meet in sweet fellowship with peaches and plums, to entertain the aunts and cousins.

"I can now see that 'mountain home,' with its sweet rivulet, finding its way among rocks and cliffs, and hillocks, and deep craggy dells. There, just beyond the precincts of the family domain was the top of the hill, crowned by its high, rolling rock, ever inviting the enterprise of each aspiring heart. Every one was amply repaid who would climb that steep hill, and ascend that high rock. There might be seen the far off mountains, in all their grandeur, and the deep valleys and widely extended plains; and more than all, that village below, containing only a few white houses, but more than some young eyes had previously seen. But sweetest of all, the length of a mile or more to the village church, was that wild, winding way traversed by that orderly group, while the family pony gave the mother her horseback ride. Then too, in winter, was that sleigh, packed so snugly and gliding so gently over the same winding way, to that same small church.

"At that 'mountain home,' every want was promptly and abundantly met by the bounties of summer and the provident care for winter. The autumnal stores, so nicely sorted and arranged, always travelled hand in hand through the long winter, like the barrel of meal and cruse of oil. The apples came out fresh in the spring, and the maple sugar, that most important grocery of the neighbourhood, was never known to fail before the warm sun, on the sparkling snow, gave delightful indication that sugar days were near. When gathered round that simple table, no one desired a richer supply than was furnished by the hand of that dear mother. The simple school day dress, too, so neat and so clean, and amply sufficient in the view of those young minds, should not be forgotten; while the rare gift of the Sunday suit, kept expressly for the occasion, formed an important era in the life of the possessor, and was remembered with grateful smiles for many days afterwards. The children of that household, thus abundantly supplied, never thought of being dependent or depressed. They felt that their father had laid up for them a rich store in grateful hearts, and among the treasures which will never decay; and that their mother, who was considered in all that neighbourhood a sort of presiding angel of good works, was continually adding to these stores. I can now remember just the appearance of that neighbour, who had a numerous household to clothe, as she said one day, 'How is it that the widow can do more for me than any one else?'

"But I remember the sorrows as well as the joys and the labours, of that loved widow, that dearest friend of my young heart. On the 21st of last December, about noon, the days of forty long years were just numbered and finished, since death came to that 'mountain home,' and took away that affectionate husband, that kindest of fathers. The dying scene, in that retired 'north room,' I can never forget. How mournful was the contrast between the clear mid-day sun, and those sorrowing hearts, those bursting sighs, and those flowing tears! Those last faltering words, 'My dear children,—and what shall I say to you, my children?—God bless you, my children,' have not yet died away on my ear. Then came the funeral, which gathered all the neighbourhood around that mourning circle. Gently was it whispered by one and other, 'We have all lost a friend; the peace-maker is gone.' How deep were those weeds of mourning, shrouding that family! Even the plaintive tones of the little one, but just able to lisp her father's name, were oft and long repeated by kind-hearted neighbours. Then came that first cold winter of widowhood. How mournfully did the cheerful fire blaze on the domestic hearth, as we gathered around that bereaved family altar! What child of that household could ever forget those extraordinary prayers of the sorrowing mother offered up day by day, for the salvation of her fatherless children? Before that mourning day came, the eldest while yet a child, professed to love the God of her fathers. As the remaining six were gathered in, one by one, and all before they had passed the years of their youth, the mother failed not to refer to her prayers, during that first winter of her widowhood. But the mother is gone, and most of the seven are gone. Together they are gathered to their peaceful rest."

Were a deep, heartfelt concern and prayer for the everlasting welfare of their children, experienced by parents universally, instead of seeking their exaltation in the world, what an effect would it produce on the morals and character of the rising generation. And were persons with slender means actuated by a conscientious impulse, to exert themselves for the proper sustenance and bringing up of those dependent upon them, their children would rarely be exposed to want, and dignity and habits of industry would be the results of such education.

The Resurrection Flower.

Among the curiosities of the floral kingdom, none is more truly extraordinary than that which is termed the resurrection flower, a specimen of which has been recently brought to this country, from the East, by Dr. I. Deck. From Professor Torrey we learn that, although the flower is very rare indeed, everywhere, and has been but seldom seen in this country, yet Bishop Wainwright procured two while he was travelling in Egypt, and Dr. Torrey himself possesses a specimen. The history of the flower possessed by Dr. Deck he states as follows: "More than eight years ago, while on a professional engagement in exploring some lost emerald and copper mines in Upper Egypt, he was of medical service to an Arab, who, in return, presented him a stem, on which were two seemingly dried up seed vessels of some plant. He was assured, many years previously the treasure had been taken from an Egyptian mummy, a female high-priestess, and was esteemed a great rarity, as few had been obtained in the last century. The Doctor was further informed that, if properly cared for, the flower would never decay. Of the truth of its being discovered on the breast of an Egyptian priestess, there are many doubts, for the Arabs are proverbial for exaggeration; but that it will, comparatively speaking, never decay, if properly cared for, seems to be confirmed by the extraordinary fact that, for more than eight years, it has accompanied Dr. Deck in all his wanderings, has been displayed and *expanded* to the gaze of the curious more than a thousand times without any diminution of its extraordinary properties, has been examined by some of the most eminent philosophers and travellers of this country and of Europe, and as yet no positive position has been assigned to it in the botanical kingdom. Baron Humboldt, to whom Dr. Deck presented the twin flower, acknowledges that, in his extensive travels in all parts of the world, he had

met with nothing like it in the vegetable kingdom, and nothing so truly wonderful.

Its origin, its location, and the plant bearing it, are entirely involved in mystery. The attractive oriental tale of its being found embalmed is rejected, because no similar flower has been found by those who have had the most experience in unrolling the ancient dead, and also because there has never been discovered anything bearing the remotest resemblance to it, upon Egyptian sculptures. Those who are conversant with the wonderful features of the Egyptian religion and priestcraft, know how quickly everything was seized upon and deified which could be made symbolical of their tenets, and were thus transmitted to posterity figured as hieroglyphics; and it is but natural to presume that this simple flower, with its brilliant halo, so typical of glory and resurrection, would have ranked high in their mythology.

On examining the flower in its unexpanded state, it resembles, both in shape and colour, a dried poppy-head with the stem attached. Upon being immersed a moment or two in a glass of water, and set upright in the neck of a small vial, in a few moments the upper petals began to burst open, gradually, yet visible to the eye; they continued to expand until, throwing themselves back in equidistant order, there was presented a beautiful radiated starry flower, somewhat resembling both the passion-flower and the sun-flower, and yet more splendid than either. The unfolding still continued until the petals *bent backward* over what might be termed the base of the flower, presenting, in bold relief in its centre, its rosette of the most exquisite form and ornamentation, and thus assuming a new charm, entirely eclipsing what a moment before seemed its absolute perfection. The drawings were made at the moment when the flower presented the phases illustrated; but language and artistic skill can but feebly portray this extraordinary specimen of the floral kingdom. After remaining open for an hour or more, the moisture gradually dissipates itself, and the fibres of the flower contract as gradually as they expanded, and it reassumes its original appearance, ready to be unfolded again by the same simple process, the number of times seeming to be only limited by the will of the possessor.

Dr. Deck suggests that the flower is a native of the Holy Land, and is a type or variety of the long-lost Rose of Jericho, called also the "Rose of Sharon," and the "Star of Bethlehem," and highly venerated for its rarity and peculiar properties by the pilgrims and Crusaders, and eagerly sought after by them as a priceless emblem of their zeal and pilgrimage, and worn on their escutcheons in a similar manner as the scollop-shell and palm branch. This idea is strengthened by the fact, that the resemblances of the flower, both opened and closed, are sculptured upon tombs of two of the Crusaders buried in the Temple Church of London, and also in the cathedrals of Bayeux and Rouen in Normandy, where some of the most illustrious Crusaders are interred.

Its botanical position is difficult to assign, as it presents some peculiarities of the highest and lowest classes. The opinion most sanctioned is, that the flower is the pericarp or seed vessel of the plant, that it grows in desert or sandy places, and falls in due course of existence from the parent stem. Retaining its seed in an arid soil and atmosphere, it is for months and years wafted about by the wind, but from lack of moisture keeping closed. Eventually it falls upon some damp spot, near some well or oasis, when it opens, deposits its seed, and thus, by a most exquisite adaptation of means to an end, exhibited in this beautiful phenomenon of nature, the work of reproduction is commenced and concluded.—*Harper's Magazine.*

For "The Friend."

BIOGRAPHICAL SKETCHES,

Of Ministers and Elders, and other concerned members of the Yearly Meeting of Philadelphia.

(Continued from page 309.)

JOHN COOPER.

John Cooper, the son of William and Margaret Cooper, of "Pine Point," West Jersey, was born there in the year 1683. A child of pious parents, who sought for ability from the Lord, rightly to direct their household, he grew up in comparative innocency, and being favoured with the merciful visitations of Divine love, and submitting thereto, the work of grace perfected the work which christian education began.

In the year 1711 or 1712, he married Ann Clark, the daughter of Benjamin Clark, once the publisher of Friends' books in London, who, in 1685, brought a stock of books and stationery with him to America, and established himself at Perth Amboy. An account now before me states, that at the time of the marriage of their daughter to John Cooper, Benjamin Clark and Ann his wife resided on the Raritan, probably where they originally settled.

John, as he advanced in years, became a useful member of religious Society, and, whilst comparatively young, was appointed to the station of an elder, for which his religious experience and a divine gift had qualified him.

In a short account issued concerning him by Gloucester and Salem Quarterly Meeting, held at Haddonfield, in 1759, and signed by his son David, the following clear testimony is borne. "He was often concerned for the well ordering of the church in its several branches, careful to demean himself, as became an humble follower of the Lamb, showing it clearly by his good example among mankind in general, and in a particular manner before his own family, which at this time is in a lively manner in the minds of some of his offspring, notwithstanding they were young in years when it pleased God to take him from them. He departed this life the 22d day of the Ninth month, 1730, in the 48th year of his age."

GEORGE CLOUGH.

George Clough, of the Falls Meeting, was one of the first elders appointed in Bucks county. He was a man, had the esteem of his neighbours and Friends, and closed a useful life on the 23d of the First month, 1731.

JOSIAH FEARN.

Among the first settlers of Darby, were a number of valuable Friends, who came from Derbyshire, England. One of these was Joshua Fearn, a minister of the gospel of Christ. Of this valuable Friend, but little information has come down to us. He was twice elected as a member of the Assembly of the Province before 1690, and he was one of the ministering Friends, who signed the testimony against Keith, in the year 1692, after which we lose sight of him.

Josiah Fearn, son of the above Friend, was one of the most substantial amongst the members of Darby Monthly Meeting. He married Sarah, daughter of that ancient and honourable minister, John Blunston, and they were concerned to order their household, in the fear of the Lord. The Lord blessed their labours in this respect, and some of their children, we know, laid down their heads in peace with the Lord, and in an humble assurance of blessed immortality.

When Darby Monthly Meeting began to appo elders, he was one of those selected for that stati having no doubt given evidence of meetness for t service. His friends say, he "was a man zealo for good order in the church, and exemplary plainness, both of speech and apparel." His c cease took place on the 27th of the First mon 1731.

JOHN TILTON.

John Tilton, of Shrewsbury, East Jersey, w the son of John Tilton and Mary his wife, w were early convinced of the Truth at Gravesen in Long Island, and suffered much persecution f their faithfulness thereto. John Tilton, the fathe was one of the original purchasers of land abo Shrewsbury, and there his son John settled. child of believing parents, brought up amongst tho who hazarded all they were worth, yea, life itse in the path of duty, the son also learned to estima all earthly enjoyments and possessions as not worth to be put in competition of the reward vouchsaf for obedience to the Lord's requirings. He w appointed an elder, and manifested by faithfulne and spiritual mindedness, that he had witnessed t baptisms, which purify the heart—the washing regeneration and renewing of the Holy Ghost,—a was following the footsteps of his pious paren from heartfelt conviction, and not from imitation.

His friends say, he was "a religious elder, ear ful to attend our meetings for worship and dis pline, and was concerned to promote good order the church. He was well beloved and esteemed His death took place in the Sixth month, 1731.

ROWLAND ELLIS.

Rowland Ellis was born near Dologelly, in M rionethshire, North Wales, in the year 1650. B place of abode was on his paternal estate, call Brin-maur. Soon after he was of age, he marri a young woman of some wealth and distinct near by, who was soon taken from him, leaving hi a child, Ann, who, by her mother's death, becar heiress to considerable estate. About the twent second year of his age, he was convinced of t Truth as held by the people called Quakers, a receiving it in the love of it, he walked with fait fulness therein. He now married again. His s cond wife appears to have been Margaret Humphre by whom he had several children. She was of family, who had already become members among Friends. He was soon called to suffer in suppo of his principles. In the year 1676, he was i prisoned with others on the charge of not resorti to the "parish church" so called, and on the 6th the Sixth month, the prisoners were brought befo the judges at Baala. These did not proceed try them on the indictment, but tendered them t oaths of allegiance and supremacy. These th could not take for conscience' sake, seeing that whom they were bound above all to obey, h charged his flock "Swear not at all." On declining to take them, one of the judges irritated out all decency, at the christian firmness of the priso ers, declared that "if they did refuse the oath second time, they should be proceeded against traitors, the men be hanged and quartered, and t women burned." On the 1st of the Seventh mont they were brought again before the justices, a the oaths again tendered to them. The prisone made a solemn declaration of their allegiance the king, and abhorrence of popery; but as th declined to violate their consciences, they were manded to close imprisonment, to be kept as felo and traitors. Winter came on, and during t

e frost, they were not allowed the benefit of a
r fire-place. The gaoler would probably have
d them more kindly, but he was in awe of
arson of Dologelly in which place the Friends
confined, who would have complained to the
s of any favour shown the prisoners. Edward
one of them, a man above sixty years of age,
le to bear such suffering as fell to their lot, during
eeverity of the cold, perished under it; dying
g the extremity of the frost.
ow long the rest of the Friends were imprison-
e do not know. Rowland, after his enlarge-
, continued faithful to his inward guide, and
ing in grace and religious experience, a dis-
ution of gospel ministry was committed to him.
n Pennsylvania was conveyed to Penn, he felt
n to the new country, and sent thither Thomas
n and family to make a settlement. His own
to remove was not yet clear, his master having
her service for him in Wales. Friends being
ant in suffering in support of their principles,
honest neighbours taking note of their inno-
courage and steadfastness, began to feel kindly
rds them, and under the powerful influence of
dar feeling, even the cruel intentions of perse-
rs began to relax. In 1685, the Yearly Meet-
of Wales addressed the following weighty epis-
to the Yearly Meeting at London:

Dear Friends and Brethren,—We dearly salute
with the salutation of life and salvation, which
his time the Lord hath visited us withal. He
manifested his life and power unto us, and
ng us, to the great comfort and satisfaction of
souls, who are made living witnesses of his
ies and goodness, which endure from genera-
to generation. Unto us who are gathered by
owerful arm of salvation, it is revealed in this
r age of the world. Blessed and praised be
oly name for ever, for he hath not left himself
out a witness, in all ages and generations. We,
you, who are called in this latter age to bear
ess to his great name and blessed Truth, let
ear it patiently, faithfully and truly in this our
eration, that those who are yet unborn, may see
know that we are a people gathered and chosen
he Lord to place his name and fear in. That
he pure fear of the living God, we all may
ll together in love and unity, out of all variance
discord of what nature soever, that [others]
r know that we are his disciples, and followers
he Lamb Christ Jesus, who is our teacher and
ructor. God grant that we may all more and
re learn of him, and be as so many Calebs and
huas, that may follow him fully and faithfully
he trying days, which are come to try the sons
daughters of men, and to shake the sandy
ndation of the hypocritical generation, that are
built upon that foundation that our God hath
ady laid; which foundation standeth sure.
ey that keep upon this foundation, they will stand,
ugh the winds blow, the storms arise, and the
ds beat. The God of Jacob hath ordained their
lding to stand, the gates of hell shall not prevail
inst it. Blessed for ever be the name of our God,
t he hath made us acquainted with this founda-
, and preserves his people on it.

"Dear Friends and Brethren, we are sensible of
ur love, care, labour and service for the Lord's
th and people. Our prayers are to the God of
aven, that he may more and more give you wis-
m, strength and courage to go through all your
dertakings. Your care hath been great; your
rvice is acceptable to many. The Lord reward
u in your own bosoms.

"These may acquaint you that we are all well,
d the Lord's presence is among us. His truth
dear to us. Our God gives acceptance with him-
self to our neighbours. They are slow to lay violent hands upon us. We are in love and unity together, condescending one to another in love. Dark and foul spirits are shut out from among us. For these his great mercies, we, in humility of mind, return thanks, praises, honours and glory to his great name, who is worthy of it from us and all his people, now and for ever."

From our Yearly Meeting, near
Dologelly, the 2d of the Second mo., 1685.

(To be continued.)

For "The Friend."

Which is Greater?

In our walk along the crowded highways of life, we often make mis-steps of greater or less danger. Sometimes we may only trip our foot—or we may break a bone, or we may meet with accidents that all the care and doctoring of a life-time will never cure, the consequences of which we bear about with us, a constant reminder of our heedlessness. But would any of us think of regretting as much a flesh-bruise as a broken bone, or a joint dislocated as a fractured skull or injured spine? Or, admitting some unaccountably careless adventurer should in successive accidents lose eyes and limbs, would we not think he had lost his senses, too, if he should, unmindful of these, mourn aloud and refuse to be comforted, because of a briar-scratch on his face?

Alas, poor human nature! Of what Lethean waters art thou drinking? This life-beating body of such exquisite workmanship, is only the casket for a little day's keeping of a priceless jewel, and *its* disasters are of eternal import!

Quite recently I was conversing with a friend, who seemed ill at ease, and finally, after relating the cause of his disquietude, he added, "I do not know when I have done anything I regretted so much." It was no injury done to any he lamented, no false act he deplored, no *sin* of thought, word, or deed; it was simply a breach of customary politeness attributable rather to circumstances than to neglect. And yet he knew not when he had done anything he regretted so much!" Ah! what he regretted was a mere scratch, to the disfigurements he had need to mourn! But perhaps the consequences might be serious? Far from it. The utmost ill resulting from this thing so deplored would be, a few of his fellow-men might deem him lacking in courtesy; and yet daily, hourly he can challenge the anger and vengeance of his and their Creator with less regret! Alas, of what fool-hardiness are we guilty, seeking the good-will of our fellow-worms, and regarding little the favour of Him, who holdeth our lives and possessions, our times and happiness in his hands. We sorrow over what will lessen us in their esteem, and heed not the thoughts of the heart—the anger, and malice and covetousness which make us vile in the eyes of Him, who searcheth all hearts. We seek the love of friends to administer to our necessities, add to our enjoyments, and comfort us in adversity, yet we slight the offers of Love Supreme,

"Who sees all sufferings, comprehends all wants,
All weakness fathoms, can supply all needs."

We grieve if another should *suspect* us of wrong motives, but rest unconcerned while the Almighty *knows* our meanness and duplicity. We are indignant at an imputation of ingratitude or dishonesty, while we receive unmoved his unnumbered blessings, and are obnoxious to the charge, "Ye have robbed God."

How dare we lift our heads in fancied integrity while these things are so? How dare we hush down our conscience with self-flattery, when candid self-examination proves we regard the created more than the Creator? If any say they do not profess to be religious, they confess their guilt rather than defend their innocence. Hypocrisy is worthy of all condemnation, but what is the *first* and *greatest commandment?* Let him who makes no effort, craves no assistance to keep *that*, feel that all other charges fall short of his guilt! Let him make this effort, crave the merciful, ever-ready assistance, and he will find how strong, and how dark a hold, unsuspected evil has had in his heart. He will learn patience under mis-construction, reproach, injustice and persecution, for He whom he aimeth to please, judgeth righteously, and his peace and happiness are not dependent upon the good will of man. The more unwaveringly his eye is fixed upon the Sun of righteousness the less he will notice the shadows that cross his pathway, and the motes that float in the air. Let him begin by earnestly following the leading of duty, and he will gather in his ever onward course, Hope, and Joy and Love, "full measure, pressed down, and shaken together, and running over," and at the end thereof there awaiteth him a crown of rejoicing "that fadeth not away."

Pa. Y. S. E.

Backbiting.—The longer I live, the more I feel the importance of adhering to the following rules, which I have laid down for myself in relation to such matters.

1st, To hear as little as possible what is to the prejudice of others.

2d. To believe nothing of the kind until I am absolutely forced to it.

3d. Never to drink into the spirit of one who circulates an ill report.

4th. Always to moderate, as far as I can, the unkindness which is expressed towards others.

5th. Always to believe that if the other side were heard, a very different account would be given of he matter.—*Charles Simeon.*

The Asteroids of our planetary system now number thirty-nine. The first, Ceres, was discovered in the year 1801, by Piazzi, at the Observatory of Palermo; the second Pallas, in 1802, by Olbers, at Bremen; the third, Juno, in 1804, by Harding, at Lilliienthal; the fourth, Vesta, in 1807, by Olbers, at Bremen; the fifth, Astræa, in 1845, by Hencke, at Dresden; the sixth, Hebe, in 1847, at Dresden, by Hencke; the seventh, Iris, in 1847, by Hind, at London; the eighth, Flora, in 1847, by Hind, at London; the ninth, Metis, in 1848, by Graham; the tenth, Hygeia, in 1849, by De Gasparis, at Naples; the eleventh, Parthenope, in 1850, by De Gasparis, at Naples; the twelfth, Clio, in 1850, by Hind, at London; the thirteenth, Egeria, in 1850, by De Gasparis, at Naples; the fourteenth, Irene, in 1851, by Hind, at London; the fifteenth, Eunomia, by De Gasparis, in 1851, at Naples; the sixteenth, Psyche, in 1852, by De Gasparis, at Naples; the seventeenth, Thetis, in 1852, by Luther, at Bilk; the eighteenth, Melpomene, in 1852, by Hind, at London; the nineteenth, Fortuna, in 1852, by Hind, at London; the twentieth, Massalia, in 1852, at Naples, by De Gasparis; the twenty-first, Letitia, in 1852, by Goldschmidt, at Paris; the twenty-second, Calliope, in 1852, by Hind, at London; the twenty-third, Thalia, in 1852, by Hind, at London; the twenty-fourth, Themis, in 1853, by De Gasparis, at Naples; the twenty-fifth, Phocea, in 1853, by Chacornac, at Marseilles; the twenty-sixth, Proserpine, in 1853, by Luther, at Bilk; the twenty-seventh, Euterpe, in 1853, by Hind, at London; the twenty-eighth, Bellona, in 1854, by Luther, at Bilk; the twenty-ninth, Amphitrite, in 1854, by Marth, at London; the thirtieth, Urania, in 1854, by Hind, at London; the thirty-first, Euphrosyne,

in 1854, by Ferguson, at Washington; the thirty-second, Pomona, in 1854, by Goldschmidt, at Paris; the thirty-third, Polyphymnia, in 1854, by Chacornac, at Paris; the thirty-fourth, Circe, in 1855, by Chacornac, at Paris; the thirty-fifth, Lencothea, in 1855, by Luther, at Bilk; the thirty-sixth, Atalanta, in 1855, by Goldschmidt, at Paris; the thirty-seventh, Fides, in 1855, by Luther, at Bilk; the thirty-eighth, Leda, by Chacornac, in 1856, at Paris; and the thirty-ninth, not yet named, by Chacornac, in 1856, at Paris. It will be observed that of these asteroids, five were discovered by Chacornac, at Paris and Marseilles; seven by De Gasparis, at Naples; ten by Hind, at London; five by Luther, at Bilk; two by Hencke, at Dresden, and two by Goldschmidt, at Paris.

For "The Friend."

Civil and Religious Liberty.

In advocating the cause of civil and religious liberty, the Society of Friends has always stood conspicuous. During a protracted period of persecution and suffering, from about the year 1650 to 1690, they nobly refused to sacrifice their conscientious scruples, maintaining a patient but firm and unyielding opposition to the arbitrary intolerance and cruelty of those in power. Their steadfastness and boldness in suffering, not only relieved other dissenters from the sharpness of persecution, but tended to prepare the way for those more correct views of toleration which subsequently obtained. Baxter, though not favourably disposed towards Friends, bears testimony to their constancy under the cruel operation of the Conventicle Act; observing, "Here the Quakers did greatly relieve the sober people for a time; for they were so resolute, and so gloried in their constancy and suffering, that they assembled openly at the Bull and Mouth, near Aldersgate, and were dragged away to the common jail, and yet desisted not, but the rest came next day. *Abundance of them died in prison*, and yet they continued their assemblies still." On this passage, Orme, the biographer of Baxter, makes this remark: "Had there been more of the same determined spirit among others, which the Friends displayed, the sufferings of all parties would sooner have come to an end. The government must have given way, as the spirit of the country would have been effectually roused. The conduct of the Quakers was infinitely to their honour." In another note relative to Friends, the same writer remarks; "The heroic and persevering conduct of the Quakers in withstanding the interferences of government with the rights of conscience, by which they finally secured those peculiar privileges they so richly deserve to enjoy, entitles them to the veneration of all the friends of civil and religious freedom."

There is no doubt that the persecution which disgraced England during the seventeenth century, and of which Friends, in common with other dissenters, bore so large a share, contributed very much toward the introduction and establishment of those more liberal and correct views of toleration and civil liberty which succeeded, and so happily distinguish the present times. The constancy of Friends under suffering; their uniform testimony in favour of liberty of conscience to all; the boldness with which they exposed the rapacity and illegal proceedings of the persecuting priests, justices and judges; and their repeated and earnest applications to the king and parliament, were eminently instrumental in preparing the way for the passage of the Toleration Act, under William and Mary in 1688. It was not as a boon for themselves, that they urged the adoption of this great measure; they took the simple ground, that liberty of conscience was the right of all men; and that all interference of the government in matters of religion, by which the subject was debarred from the exercise of this right, provided he did not molest others, was contrary to Christianity, to reason and to sound policy. In framing the government of Pennsylvania, William Penn adopted these principles, and carried them out to the fullest extent; not only tolerating every religion which owned the existence of a God, but making the professors of all, eligible to offices.

Cranberry Culture.

A communication in the Rural American, contains hints on the cultivation of the cranberry. It says:

"Select a situation for your cranberry field on a clay soil, such as is not liable to bake; or a dark loam soil, or on all moist soils where there is a mixture of sand, mostly of reclaimed lands, such as can be made moderately dry—these are all adapted to the growth of the cranberry. In fact, almost all soil that is natural for the potato is well adapted to the cultivation of the cranberry; yet the first mentioned soils would be preferred.

Prepare your soil the same as for sowing grain, by ploughing, harrowing, and making your soil even—then mark it out in drills, 18 or 20 inches apart, putting the plants in the drills five or six inches apart; hoe them slightly at first, till the roots become fastened, and afterward no other cultivation will be needed. The plants may be expected to run together, and completely cover the soil in two or three years.

The cranberry grown by cultivation, usually yields from 120 to 200 bushels an acre; its fruit is two or three times as large as the wild fruit, and of a beautiful flavour. It keeps sound from harvest to harvest again. The fruit is generally gathered in September—it is gathered with wire-teeth rakes made for the purpose. One man will generally gather from 30 to 40 bushels per day, with the aid of a boy to pick up the scattering fruit."

The Bell Cranberry variety naturalizes to dry soil most easily, is larger than the other varieties in its wild state, and is the best adapted for cultivation. The proper time for fall transplanting is October and November; for spring, from the middle of March to about the 25th of May.

The Homestead, Hartford, Ct., thus speaks of the cranberry:

"Crops of it are rarely sold for less than two dollars a bushel, and the past winter have commanded readily six to eight dollars, and few could get them at that price. There is no doubt that we have thousands of acres of poor swamp land, now not worth five dollars an acre, that might be devoted to this crop, and raise the value of the land to $200 per acre. The cranberry meadows of Natick, Mass., we are informed, are worth from $1,000 to $1,300 to the acre, and probably pay the interest on that valuation. There is no danger of glutting the market with this fruit for many years to come. The inhabitants of Boston and New York, to say nothing of other cities, have but just begun to get a taste of cranberries, and that taste once formed is certain to create a lively demand for the article."

Crops of this excellent article are reported as large as 250 bushels to the acre, though generally a bushel to the square rod is considered a large yield. During the past winter $18, $20, and $25 per barrel were paid for cranberries by our hotels. Usual price $12 to $15 per barrel.

SMALL FRUIT.—The Wisconsin Farmer thus prefaces an article on the cultivation of our currant, raspberry and gooseberry:

"Fruit being no longer regarded as a mere luxury, but an indispensable and healthful article of regular diet, the small fruit which complete the succession of fruits, between the long keeping winter sorts and the earliest summer varieties, should not be overlooked. Yet how few know them in perfection of their best varieties under the best culture. Look at our gardens as a general thing. A neglected patch of strawberry vines in some out-the-way place, overgrown with grass and weeds. A row of straggling currant bushes in a stiff sod, left to take care of themselves, receiving no care in any way of manuring and pruning—producing small, seedy, exceedingly acid fruit, scarcely worth picking. Raspberry bushes along the fence, where they stand unmolested by tillage year after year, producing small crops of poor fruit. How seldom do we meet the large luscious fruits of the best sorts, the product of thorough cultivation. Who has *plenty* of fine strawberries, or gooseberries, or raspberries to supply their tables in any sort of abundance? The sauces upon our hotel and tavern tables are of wild or some other foreign dried fruit. The larger prices obtained by those who have turned their attention in this direction, is good evidence of the profitableness of their culture.

For "The Friend."

Accounts of the first fruits of young disciples, when the faculties were clear and vigorous, and their love to the cause of Christ pure and fervent, produce enlivening sensations in those who succeed them. They call to mind seasons when other faithful servants of latter times, now gathered to their heavenly homes, were employed in watering the young plants and training them for the service of the best of masters. Deborah Bell just entered into the ministry, relates a little trip out from home, which she took at the request of a mother in Israel. "In this year, 1708" she says, "our ancient and worthy Friend, Eleanor Haydock, being weak, sent a messenger to me, earnestly desiring I would pay her a visit, saying, if she were able to travel she would go much farther to see me. I consulted my mother about it, *whose advice I greatly regarded in all my undertakings*, being a faithful woman, and of great experience in the work of truth, and a tender nursing mother to me, in a spiritual sense, under all my deepest exercises. She advised me to answer the Friend's request; and I undertook the journey, and in my way I dropped in to an evening meeting, sometimes kept at a Friend's house, where had a son that had taken undue liberties and left Friends, but was present in that meeting; and the power of Truth came over us in a great degree. The young man was reached and much tendered, and came to me after the meeting, trembling, and let drop many tears. I spoke to him what was then given me, with which he was much affected, *though but a few* words. I afterwards became further acquainted with him, for he heartily joined with Friends, and a great reformation was wrought in him, by that Divine power which purifies the heart, and in process of time he had a few words in meetings. He did not live many years, but I hope made a good end."

Where Christ is felt to be in the midst of children, when assembled for the solemn purpose of worship, the great object is attained. The heart of the humble, contrite ones, are refreshed and animated to serve him, and if there comes in one whom his compassion is extending, even the silent exercise of the living may be blessed to his humiliation, and the anointing of his vision to see his lost condition. The ministry of a young minister who has a low estimate of his or her offerings, may enter deeply into the heart of such, and be made a means of showing a striking contrast, between the condition of the faithful and the unfaithful one, and of turning him to the love of the truth. This is a part of the precious advantages, growing out of the union of pra-

restling for the blessing among the members
ist's church, who are kept alive in the truth.
ext day, coming to Eleanor Haydocks," she
f I was kindly received; she rejoiced much
had answered her request. I stayed with
me time, and had divers good and comfort-
eetings thereaway, and was also much edified
lped by that *good woman's conversation*,
a person of great experience, well deserving
me of a mother in Israel. After my stay
er I returned home again in peace, and spent
time in *private retirement*, in which I found
th and great comfort, and the Lord was near
my deep exercises, which were often weighty
me. In the winter of this year we had meet-
n First-day evenings, and I being young and
known in town, report of my appearing in the
ry, excited the curiosity of many people of
persuasions, who flocked into these evening
gs, where they could come without being so
observed, as in the day time. This added
to my present exercise, and I lived a life of
ity and godly fear, often fervently desiring
ord would give me wisdom, and guide me by
rn spirit, that neither in conduct nor ministry,
ht ever do or say anything that might dis-
ge, or turn any enquiring soul out of the way;
orever blessed be his name, his ear was open
r secret prayers, for in those crowded evening
ngs we were favoured with his presence, and
many comfortable times. The truth pre-
l, and often come over all, to the praise and
of God, the master of our assemblies."

life of humility and godly fear is the Chris-
duty and safety. If he occupies the station
minister, he cannot expect that what he deli-
to others will be received, unless his own life
spirit correspond with his profession, and
plify the doctrine he preaches. When any
s acknowledged in that capacity, there is an
tional responsibility incurred, not on his own
nt only, but for the sake and character of
Society. He is to be "an example to the be-
rs in word, in conversation, in charity, in spirit,
ith, in purity." He should guard against all
osed importance above his brethren on account
is station, or imagining that the Truth allows
ties to him, which it would condemn in others.
charity would warn him against indulging an
oper censorious spirit towards his brethren, and
d lead him to regard all men in that light; as a
ster, under the influence of the universal love
od, said, "Every country is my country, and
y man my brother." The more sensibly he
his own frailties and liability to err, the slower
ill be to cast off and condemn others as desti-
of good, or altogether incapable of promoting
l in their fellow professors. A just view of his
impotency, leading to the exercise of charity,
r from confounding right and wrong, prepares
to make clearer and more perfect discrimina-
because it increases his sensitiveness to evil,
his fear of offending his Lord, and losing the
erving power of his Holy Spirit.

Canine Fidelity.—We find the following state-
t in a late number of one of our city papers.

Our attention was called recently to a poor,
onsolate old dog, who for a number of months
been hanging around the steps of the Mayor's
ce, at Fifth and Chesnut streets. There is a
e of sorrow and romance connected with this old
ow, which deserves to have a place among the
ny anecdotes of canine fidelity already recorded
the honour of their race. It appears that some
e last fall a man was brought to the Mayor's
ce on some allegation or other, and his dog fol-
lowed him. The man shortly after was sent off in the prison van. The dog, it appears, was not aware of his master's removal, but remained watching the cell where he had last seen him enter. After some time he evinced great uneasiness, whining and scratching at the cell doors. For this alleged disorderly conduct he was finally ejected into the street, and there he has remained ever since, and will not be driven away. He makes his bed under the iron steps near the corner, and is waiting for the return of his master, whom nobody appears to know, and whose name has been forgotten.

"During the whole of last winter, in snow, rain and midnight's chilling frost, he kept his post; during the severest portion of the winter he was heard sometimes in the night moaning piteously. Occasionally, as he sees some one coming in the distance, he stands erect, wags his tail, and looks all impatient; but as the individual approaches, his hopes and his tail fall apace, it is not his long-looked for master, and he turns again to his corner and his sorrow. Some benevolent persons at a hotel close by, furnish him with food, and recently, since his history has become known, sympathizing friends as they pass drop him a cracker; he refuses all caresses, and will not associate with other dogs—his mission is to watch and wait for the absent stranger."

THE FRIEND.

SIXTH MONTH 14, 1856.

NEW YORK YEARLY MEETING.

Through the attention of a member of New York Yearly Meeting we have been furnished with the following brief notice of its proceedings: Should we on receiving a copy of the printed minutes find anything further of general interest we shall lay it before our readers.

It has been gratifying to learn that there are "many sound intelligent Friends" within the limits of that meeting, preserved "for the good work." These while taking counsel together and encouraging each other, were united in believing that "the time for their relief is not yet." It is greatly to be desired that the large body of its members who are opposed to the modern innovations on our doctrines and discipline, and cannot unite with its proceedings in regard to New England and Ohio Yearly Meetings, may yet be enabled to unite together in the support of sound principles and practices, and in bearing a testimony against error, in a manner consistent with the order of our Religious Society.

The Yearly Meeting convened on Sixth-day, the 30th of Fifth mo.,—the number in attendance being materially less then heretofore. A number of members and ministers, of both sexes, from Ohio, Iowa and New England being in attendance—some with minutes, and some without. Epistles were received from England, Ireland, New England, (larger body) Baltimore, North Carolina, Ohio (the meeting of which J. Binns is clerk,) and Indiana. The clerk then informed the meeting that he had on the table a paper purporting to be an Epistle from the Yearly Meeting of Philadelphia, and desired the direction of the meeting whether to read it or not. After considerable discussion, it was read;—and, after a somewhat more extended one, it was concluded to appoint a committee to take it under consideration (or as the mover subsequently stated his view, to consider whether this meeting had done its whole duty in the extension of advice to Philadelphia Yearly Meeting, in regard to its proceedings in the cases of New England and Ohio Yearly Meetings) and to report their judgment what disposition should be made of it.

Accompanying the Epistle from Dublin, was a paper stating that the meeting had come to the conclusion to receive the Epistle from Ohio, signed by J. Binns,—and with the Epistle from Ohio, signed by J. Binns, was received a paper containing an account of the "stripped and tried" condition in which they found themselves, since the separation; and asking the sympathy and aid of New York Yearly Meeting—hoping this meeting would see the way to appoint a committee to confer with one they had appointed for the purpose to meet at Adrian in the state of Michigan at a time during Sixth mo., of the present year which they named, for the purpose of setting off to them Adrian Quarterly Meeting.

On Seventh-day, the answers to the queries were considered—after which the minutes of the Meeting for Sufferings were read—by which, it appeared that in a correspondence with the same body in Ohio, advice had been tendered against their proceeding to disownments in the cases of those members there who did not unite with them. It should have been stated in its proper place that the reports from Farmington Quarterly Meeting conveyed the information that a separation had taken place within the limits of that meeting, and that at the time of penning the report, another Quarterly Meeting, purporting to be Farmington Quarterly Meeting, was in course of being held at Hartland, within the limits of that Quarter.*

Second-day—considered the subject of a proposition to revise the Book of Discipline, without entering into the measure—and after some other business of no *general* interest, in the afternoon took up the proposition from Ohio for the procuring of Adrian Quarterly Meeting, (Michigan)—after much discussion, the subject was referred to that Quarterly Meeting, from which no intelligence of their wishes on the subject had been received; requesting that Meeting to state its desires in the matter to this meeting.

Third-day—in addition to some other business, the subject of education was brought before the meeting by the Report of the Committee appointed several years since to obtain subscriptions to the amount of one hundred thousand dollars for the establishment of a Boarding school, on a liberal scale, to be called the Central School. The committee stated they had obtained subscriptions not exceeding one third that amount, and had got to the end of their labours. After considerable discussion, the committee was released, and the project abandoned. A committee was then appointed to consider the subject of education generally and to report at a future sitting of the meeting. In connection with which the report of the committee having the care of Nine Partners Boarding school property was read.—This property is leased out to a Friend who keeps a school in it on his own account, and receives those scholars who are educated on the permanent fund. The report of the committee to consider the subject connected with the Philadelphia Epistle was presented and read—it was short—merely stating, as the judgment of the committee, that this meeting has yet some more efforts to make on the subject, and recommending that it be referred to next year; which was adopted, without time for discussion of the merits of the proposition.

Fourth-day, morning,—meeting for worship.—Afternoon was devoted principally to the consideration of the subject of education, which was largely discussed—some urging the propriety of renewing the appointment of the committee to obtain sub-

* This is the third or fourth Quarter within which separations have taken place.—*Ed. of Friend.*

scriptions to the $100,000 fund; and it appeared that the women's meeting which had united in that effort was not satisfied with the action of the men's meeting in the case. After several communications between the two meetings, and after much oral recommendation, on the subject of keeping up family schools,—but more especially on that of establishing "First-day schools," for instruction in the Scriptures,—the meeting, at a late hour, came to the conclusion that the matter had been disposed of in the proper way, and directed the Quarterly Meetings to renew the efforts which were in successful operation when the last measure was adopted, (and which was then directed to be suspended,) viz.,—to obtain subscriptions and donations to a fund for educational purposes,—to be paid over to the Friend who was then appointed to receive it, and who had now a considerable amount in his hands.

Accompanying the epistle from Indiana, was a notice that, in accordance with an application from several of the Quarterly Meetings, it had been concluded to establish a new Yearly Meeting, to be called the "Western Yearly Meeting," and asking the judgment of this meeting thereon. After some time of deliberation, it was concluded to inform that meeting of our assent thereto.

Fifth-day, morning,—Essays of epistles to London, Dublin, New England, (larger body,) Baltimore, North Carolina, Ohio, (J. Binns, clerk,) and Indiana, were presented and read; after which many communications were made, many of them in allusion to the separation then about to take place. Friends were also reminded, in allusion to the much that had been said on the subject of the Scriptures and Scripture instruction, that however valuable, we did not recognize them as the chief or principal rule, but in accordance with the advice of our Divine Master, when he recommended the Jews to search them, for in them they thought they had eternal life, yet complained that they would not come unto him that they might have life.

The meeting then concluded, to meet again next year at the same time and place.

SUMMARY OF EVENTS.

EUROPE.—News from Liverpool to Fifth mo. 24th.

In the House of Lords, an interesting debate had taken place on Lord Colchester's motion, that Parliament disapproves of the conduct of the Plenipotentiaries of the Congress, held at Paris, for having abandoned, without the knowledge or sanction of Parliament, the principles inherent in all belligerent powers, of capturing enemies' goods on board neutral ships. Lord Clarendon made an able speech, defending the course of the British Plenipotentiaries in giving up a principle which it was impossible to maintain. Lord Derby strongly denounced the abandonment of this ancient privilege as not only humiliating and derogatory, but dangerous to the interests of England. After further debate, the motion was lost by a large majority. The Danish Consuls in Russian ports have been instructed to afford the necessary commercial facilities to British subjects until British Consuls can be sent to Russia. The British press continues to keep alive the excitement respecting the oppression and bad government in Italy. The new loan of £5,000,000 was readily taken, the subscriptions, it is said, amounting to forty millions. Consols are quoted at 94¼. The sales of cotton at Liverpool for the week, were 37,000 bales: the stock of American in port was large, amounting to 528,000 bales; prices were nearly unchanged. Breadstuffs had slightly declined; good Ohio flour, 36s. a 37s.; Western Canal, 30s. a 33s.

FRANCE.—Baron Hubner has presented his credentials as Minister from Austria. No resident Minister has yet been appointed from Russia, Count Orloff at present performing the duties.

PRUSSIA.—A postal convention has been signed between Prussia and the United States. Von Rochow has been sentenced to five years' imprisonment in the fortress, for his recent fatal duel with the Minister of Police.

RUSSIA.—Navigation was opened to St. Petersburg, on the 18th ult. The first English steamer, bound to Cronstadt, has been lost with all her cargo, off the Island of Odell, in the Gulf of Finland. The evacuation of the Crimea by the French was proceeding rapidly. Several Tartars had been hanged for rendering assistance to the enemies of Russia; some had also been sent into exile, and others condemned to work on the roads for life. The Circassian village of Sunech, and 6000 cattle had been taken by the Russians.

MEXICO.—The present government seems determined to assert the supremacy of the State over the Church. The Bishop of Puebla, who was one of the principals in the late insurrection, has been banished the country. He attempted to rouse a feeling in his favour, but the troops promptly escorted him on shipboard. Several priests have been arrested for preaching sedition, and one was arrested in the street, armed with a rifle. It was determined these men should be tried by the civil authorities, notwithstanding the exclusive jurisdiction claimed by the Church.

HAYTI.—A letter from Aux Cayes of the 10th ult., states that a formidable insurrection had broken out in that part of Hayti, against the Emperor Soloque. From two to three thousand insurgents were marching to Aux Cayes. According to later advices, the government had succeeded in putting down the movement.

UNITED STATES.—On the 2d inst., the President issued his official proclamation, establishing the boundary line between the United States and Mexico, as marked out by the commissioners, under the treaty of Twelfth month 30th, 1853.

Congress.—In consequence of the assembling of the Democratic Convention at Cincinnati, for the purpose of nominating candidates for the Presidency and Vice-Presidency, the National Legislature was but little in session last week, and transacted no business of moment. On the 9th inst., a bill was introduced by Senator Trumbull, having in view the restoration of peace and order in Kansas. The bill proposes to terminate all laws and supposed laws in the territory, and bring it under the territorial government of Nebraska.

The Democratic Nominations.—The Cincinnati Convention, at the seventeenth ballot, voted unanimously for James Buchanan, of Pennsylvania, as its candidate for the Presidency. John C. Breckenridge, of Kentucky, was selected, at a second ballot, as its candidate for the Vice-Presidency. The Convention enlarged the party platform, by incorporating into it the doctrine of "squatter sovereignty," the principle on which the Kansas and Nebraska bill was framed. It also reprobates all proscription, either on account of religion or place of birth. The party is also declared pledged to the acquisition and maintenance of a preponderating American influence in the Gulf of Mexico.

Kansas.—The Investigating Committee adjourned from Leavenworth to Westport on the 31st ult. They were to leave for Washington on the 10th inst. The property destroyed or carried off by the sheriff's posse at Lawrence, is valued at one hundred thousand dollars. The reports by telegraph speak of murders and outrages committed by both parties. The statements are often contradictory, leading to the conclusion that but little reliance can be placed on any of them, the facts being either exaggerated or entirely mis-stated.

Minnesota, is the model of a prosperous, peaceful, well governed territory. The Legislature has just adjourned, having disposed satisfactorily to the whole population, of all business brought before it. In reply to circulars addressed to the members, to post-masters and other persons in public positions, returns of the population have been collected. It is ascertained, with reasonable accuracy, to be 120,000, more than sufficient to justify the admission of Minnesota as a State.

New York and Pennsylvania.—In 1845, the assessed value of property in New York was $605,846,085, and the taxes $4,170,527. In 1855, the assessed value had increased to $1,402,849,564, and the taxes to $11,678,011. In 1845, the assessed value of property in Pennsylvania was $420,802,809; in 1855, it had increased to $581,-731,304. The taxes in the former year were $3,010,062; in the latter, $5,397,471. The great increase in New York is attributed principally to the action of railroads.

Philadelphia.—Mortality last week, 197. The mean temperature for the Fifth month, was 60 degrees, which is 2½° below the average of the last thirty years, and 1½° below, the Fifth month last year. The highest of the thermometer was 87° on the 24th, and the lowest, 40° on the 31st. The amount of rain that fell in the city, was 2.60 inches; at Paoli, 3.24, and at Trenton, 2.95.

New York.—Mortality last week, 337.

Miscellaneous.—*Singular Phenomenon.*—During the thunder storm on the 4th inst., the Lake suddenly rose three feet at Oswego, and as suddenly fell again. The pheuomenon was repeated several times, causing vessels to be forced rapidly from their moorings, and creating general commotion in the harbour.

The Methodist Episcopal Church, in General Conference at Indianapolis, had the subject of slavery before it several days, on a proposition to introduce in the church discipline a general rule forbidding the traffic in slaves and the holding of slaves for selfish or mercenary purposes. The Conference, after a long debate, voted down—123 to 92—as unwise to introduce this subject now.

Building in St. Louis.—The St. Louis Republican says that contracts have already been made to build two thousand houses in that city this season, and that the mania for building is only checked by the inability to procure lumber and materials for an additional number.

Large Shipment of Gold.—The ship Stephen Hart, from Australia for London, was spoken on the 14th inst. She reported having two and a half tons of gold on board, and half her crew in irons for attempted mutiny.

Water in the Mesilla Valley.—The Secretary of War has, by actual experiment, proved the entire success of artesian wells on the plains of Mesilla Valley. One of seven hundred feet deep, supplies an abundance of water.

Ohio Statistics.—The income of Ohio last year was about four and a quarter millions of dollars, and the expenditures three millions and a half. It has 800 miles of canals, 600 of navigable rivers, and 2000 miles of railroads. Its wheat crop last year was 30,000,000 bushels, and corn 80,000,000 bushels. In the year 1850, before the completion of its railway system, the State of Ohio had an aggregate amount of taxable property rated at $438,876,340, and in the year 1855, after the completion of the system, the value of the same description of property is set down at $869,877,354, very nearly double.
